U.S. DEPARTMENT OF LABOR Bureau of Labor Statistics Washington 25, D. C.

CONSUMER PRICE INDEX FOR MAY 1961

The Consumer Price Index declined by 0.1 percent between April and May to 127.4 (1947-49=100), according to the U.S. Department of Labor's Bureau of Labor Statistics. During the past 8 months, the index has been relatively stable with fluctuations between 127.3 to 127.5. Lower average food prices, particularly meats and poultry, were largely responsible for the decrease as nonfood components registered a small overall advance of 0.2 percent, led by continued increases for services and higher prices for used cars and gasoline. Compared with a year earlier, average retail prices of consumer goods and services have advanced 0.9 percent and remain within 0.1 percent of the record level of 127.5 first reached in December 1960 and again in February, March, and April of 1961.

An 0.4 percent decline in average retail food prices stemmed primarily from a contraseasonal drop in retail prices of fresh meats combined with sharp reductions for poultry; however, lower prices for eggs, fresh milk, and some fresh fruits and fresh vegetables also contributed significantly to the downward movement between April and May. The most important increases were seasonal advances for apples and some fresh vegetables together with higher average prices for fats and oils. The May index for all foods, at 120.7 (1947-49=100), was 0.8 percent above year earlier levels, with the main advances for restaurant meals (which incorporate service as well as product and overhead costs), bakery products, dairy products, and fats and oils.

Meat prices were lower for the fourth consecutive month reflecting ample market supplies and the sharp competition of poultry prices which were at their lowest postwar level, approximately 31 percent below average prices prevailing in 1947. Prices were down for nearly all beef, pork, and lamb products, marking the fourth successive monthly decrease in pork prices and the third successive monthly decline in beef prices this year. Compared with a year ago prices of meats are unchanged while poultry has decreased by about 10 percent.

A 3.3 percent decrease in egg prices was attributable to seasonally higher production levels and the delay in heavy purchases for commercial storage in anticipation of higher production levels in the fall. Egg prices were supported somewhat by continuing heavy Government purchase of dried eggs for relief distribution.

Average prices for dairy products were lower, marking a continuation of the downtrend in evidence since December 1960. The current decline was due almost entirely to seasonally lower prices for fresh milk.

Seasonal influences resulted in an increase of 1.1 percent in retail prices of fresh fruits and vegetables. As the supply of apples in storage dwindled, retail prices rose by about 11 percent, more than offsetting decreases in prices of citrus fruits, bananas, and strawberries. Strawberry prices dropped about 20 percent as supplies increased towards their seasonal peak. Except for a decrease of 3.3 percent in prices of frozen orange juice concentrate, price movements for processed fruits and vegetables were relatively minor.

Prices of fats and oils increased by 1.3 percent over the month as all items except lard advanced. Higher prices for shortening contributed most to the overall rise; the decline in lard prices was attributable to sizable production and decreased exports.

HOUSING

The slight decrease (0.1 percent) in the housing index was due mainly to continued seasonal reductions in average prices of solid and petroleum fuels and to lower prices for household textiles featured in May "White

Sales." Relatively unimportant price fluctuations were recorded for other important housing components. First mortgage rates were lower in most cities while rents continued to move up gradually.

TRANSPORTATION

A rise in used car prices and higher gasoline prices caused the transportation index to advance by 0.5 percent in May. Used car prices continued the recovery which began in February, advancing 2.1 percent. This greater than seasonal rise brought the index above the previous year's level for the first time since March 1960. The strengthening in the used car market was widespread and was attributable to a shortage of desirable used cars. Dealers' selling prices of new standard and compact cars in the popular price lines averaged 0.3 percent lower as some dealers granted larger concessions. New car inventories, though well below the all-time high reached last summer, were still substantial. Sharp recoveries in a few cities raised May gasoline prices 1.1 percent above April levels. However, in many cities in the Midwest and on the Pacific coast gasoline prices declined due, in part, to continuing price wars.

MEDICAL CARE AND OTHER GROUPS

An 0.3 percent increase in medical care stemmed mainly from widespread increases in fees for professional services and higher hospitalization insurance rates.

Prices of tobacco products rose by 0.7 percent over the month as 3 states increased their taxes on cigarettes. These increases accounted for most of the advance in the other goods and services group.

The reading and recreation group declined by 0.2 percent, reflecting competitive price reductions for television and radio sets and lower movie admissions.

COST-OF-LIVING
ADJUSTMENT
tied to the U.S. Consumer Price Index for May 1961 of 127.4 (1947-49=100). About 123,000 workers, including 54,000 employees of major aluminum firms, 44,000 employees of metal container manufacturers, and 25,000 employees of two aircraft companies, are scheduled to receive increases ranging from 2 to 3 cents an hour, which reflect the rise in the CPI from May 1960. On the basis of the quarterly change, about 23,000 employees of various metalworking companies will receive 1 cent an hour reductions and allowances for most of the remaining 164,000 workers will not be changed.

Brief Explanation of the CPI

The Consumer Price Index (CPI) measures average changes in prices of goods and services usually bought by city families of wage earners and clerical workers. It is based on prices of about 300 items which were selected so that their price changes would represent the movement of prices of all goods and services purchased by wage and clerical families; they include all of the important items in family spending. Prices for these items are obtained in 46 cities which were chosen to represent all urban places in the United States; they are collected from grocery and department stores, hospitals, filling stations, and other types of stores and service establishments which wage-earner and clerical-worker families patronize.

Prices of foods, fuels, and a few other items are obtained every month in all 46 cities. Prices of most other commodities and services are collected every month in the 5 largest cities and every 3 months in other cities. Mail questionnaires are used to obtain local transit fares, public utility rates, newspaper prices, fuel prices, and certain other items which change in price infrequently. Prices of most other goods and services are obtained by personal visits of the Bureau's trained representatives.

In calculating the index, price changes for the various items in each city are averaged together with weights which represent their importance in family spending. City data are then combined in the total index with weights based on the 1950 populations of cities they represent. Index numbers are computed on the base $1947-49 \pm 100$.

The national index (the United States city average) includes prices from the 20 large cities for which separate indexes are published in this report, as well as from the following 26 medium-sized and small cities:

Anna, Illinois
Camden, Arkansas
Canton, Ohio
Charleston, W. Virginia
Evansville, Indiana
Garrett, Indiana
Glendale, Arizona
Grand Forks, N. Dakota
Grand Island, Nebraska

Huntington, W. Virginia
Laconia, New Hampshire
Lodi, California
Lynchburg, Virginia
Madill, Oklahoma
Madison, Wisconsin
Middlesboro, Kentucky
Middletown, Connecticut
Newark, Ohio

Pulaski, Virginia Ravenna, Ohio Rawlins, Wyoming San Jose, California Sandpoint, Idaho Shawnee, Qklahoma Shenandoah, Iowa Youngstown, Ohio

Comparisons of city indexes show only that prices in one city changed more or less than in another. The city indexes cannot be used to measure differences in price levels or in living costs between cities.

A description of the index and historical tables of index numbers for the United States city average and for 20 large cities are available on request to the Bureau of Labor Statistics in Washington or any of its regional offices (addresses below). The historical tables include index numbers for All Items, Food, Apparel, and Rent for periods from 1913 to date; and for other groups of goods and services from 1935 to date.
