## U.S. DEPARTMENT OF LABOR Bureau of Labor Statistics Washington 25, D. C.

#### CONSUMER PRICE INDEX FOR DECEMBER 1961

Prices of consumer goods and services in U.S. cities registered a further decline of 0.1 percent in December, according to the United States Department of Labor's Bureau of Labor Statistics. The decrease in the Consumer Price Index to 128.2 (1947-49=100), reflected lower average prices for commodities such as new and used cars, gasoline, and apparel. Food prices averaged higher (0.1 percent) and there was a continued small gain in service prices.

The index rose only 0.5 over the year, the smallest increase for a comparable period since 1955. Moreover, most of this increase occurred between June and July when the index advanced by 0.4 percent. The rise in consumer prices from December 1960 was due largely to a 1.7 percent increase in services which, combined with higher average prices for durables (chiefly used cars), outweighed a 0.4 percent decline for nondurables, mainly food and gasoline.

The 0.8 percent decrease in December for transportation was the most important price development. Lower average prices for used cars and gasoline were responsible for most of the decline, but lower prices for new cars and tires were additional minor factors. Moderating the decrease somewhat was an 0.5 percent advance in public transportation, as transit fares increased in a few cities.

Used car prices fell by nearly 3 percent, as improvement in new car sales and seasonally lower demand led to the accumulation of larger stocks in dealers' hands. However, used car prices were about 14 percent above December 1960's relatively low level.

Lower gasoline prices continued to reflect strong competitive influences which currently prevail in the market due to the introduction of new grades of gasoline and the competition engendered from suppliers' attempts to enhance or retain their market position.

Reductions at year-end clearance sales for winter and fall items of men's and boys' clothing and women's and girls' apparel were responsible for the 0.2 percent decline in the apparel index. Footwear prices rose slightly, continuing their steady climb which began in July 1961. Earlier increases in leather prices and higher labor costs were the reasons given for the advance. Shoe prices were 1.3 percent above year-ago levels and accounted for a major share of the 0.4 percent increase in the overall apparel index since December 1960.

The major influences in the 0.1 percent rise of retail food prices were seasonal advances for fresh vegetables and higher average prices for poultry and for beef and veal products. Lower average prices for eggs and most pork products represented the most significant reductions moderating the increase in the food price index. Price movements among other important food products were relatively small and about equally divided between increases and decreases. The index for all foods, at 120.4 (1947-49=100) was 0.8 percent below December 1960 and about 1.3 percent below the peak of 122.0 reached in July 1961.

Prices of fresh and processed fruits and vegetables rose by 1.5 percent in December, led by the higher prices for all fresh vegetables, which reflected seasonally decreasing supplies. Increases for apples, bananas, and lemons more than offset lower prices of grapafruit and oranges.

Average prices of meats, poultry, and fish rose by 0.1 percent, due

chiefly to higher prices for poultry and beef and veal products, which more than outweighed a continuing seasonal decline in average prices of pork products. The increase in poultry prices reflected lower production. Despite the 4.3 percent rise in poultry prices in December, however, the index for poultry was nearly 10 percent below a year ago.

In comparison with December 1960, the meats, poultry, and fish index was 1.6 percent lower, largely because of the sharp decline registered by poultry prices and moderately lower prices for pork products.

Lower egg prices in December were attributable to seasonally increased supplies. In comparison with a year earlier, egg prices were off by 18 percent, largely a result of increased production in the last half of 1961 above 1960 levels.

HOUSING AND

A 0.2 percent increase in the housing index reflected primarily advances for elements of home ownership costs, rents, and solid and petroleum fuels. Higher maintenance costs and taxes were the principal reasons given for the continued rise in rents, while advances for heating fuels were attributed to continued strong winter demand. Retail prices of housefurnishings declined slightly for the third successive month, mainly because of lower prices for durable household goods. Continuing widespread price competition for some major appliances and soft surface floor coverings was primarily responsible.

The medical care index rose by 0.1 percent with higher rates for professional services, hospitalization insurance, and hospital room rates more than offsetting a decrease in prices of prescriptions and drugs.

The 1961 annual average Consumer Price Index of 127.8 was 1.0 percent above the 1960 average, representing, with the exception of 1959, the smallest yearly increase since 1955. Continued gains in service charges, especially those associated with shelter and medical care, were again mainly responsible for the 1961 increases. However higher food prices also contributed significantly to the overall rise, led by higher average prices for restaurant meals, cereals and bakery products, and dairy products.

COST-OF-LIVING
ADJUSTMENTS

Cost-of-living allowances of approximately 264,000 workers will be adjusted on the basis of the December national index. About 230,000 employees of long distance and local trucking firms located in all geographical regions, except the Atlantic seaboard, will receive 1-cent increases in their hourly rates and, in some cases, a one-quarter of a mill per mile increase in their mileage rates. These increases are based on semi-annual or annual reviews. Approximately 31,000 employees, mainly aircraft workers, are scheduled to receive reductions of 1 cent per hour, based on a quarterly review. No change will be made for 46,000 other workers in a variety of industries.

# Brief Explanation of the CPI

The Consumer Price Index (CPI) measures average changes in prices of goods and services usually bought by city families of wage earners and clerical workers. It is based on prices of about 300 items which were selected so that their price changes would represent the movement of prices of all goods and services purchased by wage and clerical families; they include all of the important items in family spending. Prices for these items are obtained in 46 cities which were chosen to represent all urban places in the United States; they are collected from grocery and department stores, hospitals, filling stations, and other types of stores and service establishments which wage-earner and clerical-worker families patronize.

Prices of foods, fuels, and a few other items are obtained every month in all 46 cities. Prices of most other commodities and services are collected every month in the 5 largest cities and every 3 months in other cities. Mail questionnaires are used to obtain local transit fares, public utility rates, newspaper prices, fuel prices, and certain other items which change in price infrequently. Prices of most other goods and services are obtained by personal visits of the Bureau's trained representatives.

In calculating the index, price changes for the various items in each city are averaged together with weights which represent their importance in family spending. City data are then combined in the total index with weights based on the 1950 populations of cities they represent. Index numbers are computed on the base  $1947-49 \pm 100$ .

The national index (the United States city average) includes prices from the 20 large cities for which separate indexes are published in this report, as well as from the following 26 medium-sized and small cities:

Anna, Illinois
Camden, Arkansas
Canton, Ohio
Charleston, W. Virginia
Evansville, Indiana
Garrett, Indiana
Glendale, Arizona
Grand Forks, N. Dakota
Grand Island, Nebraska

Huntington, W. Virginia
Laconia, New Hampshire
Lodi, California
Lynchburg, Virginia
Madill, Oklahoma
Madison, Wisconsin
Middlesboro, Kentucky
Middletown, Connecticut
Newark, Ohio

Pulaski, Virginia Ravenna, Ohio Rawlins, Wyoming San Jose, California Sandpoint, Idaho Shawnee, Qklahoma Shenandoah, Iowa Youngstown, Ohio

Comparisons of city indexes show only that prices in one city changed more or less than in another. The city indexes cannot be used to measure differences in price levels or in living costs between cities.

A description of the index and historical tables of index numbers for the United States city average and for 20 large cities are available on request to the Bureau of Labor Statistics in Washington or any of its regional offices (addresses below). The historical tables include index numbers for All Items, Food, Apparel, and Rent for periods from 1913 to date; and for other groups of goods and services from 1935 to date.
