
the consumer price index
U. S. DEPARTMENT OF LABOR J. D. Hodgson, Secretary

BUREAU OF LABOR STATISTICS
Geoffrey H. Moore, Commissioner
OFFICE OF PRICES
AND LIVING CONDITIONS
Joel Popkin, Assistant Commissioner
a monthly report on consumer price movements including statistical tables and technical notes.

## The Consumer Price Index

The Consumer Price Index rose 0.2 percent in April to 124.3 percent of its 1967 base. The increase was primarily due to higher prices for men's clothing, used cars, restaurant meals, and most household services, the effects of which were moderated by lower prices for food purchased in grocery stores and gasoline, and a decline in mortgage interest rates. The April index was 3.4 percent higher than it was a year ago.

After seasonal adjustment, the April increase was also 0.2 percent. Since the wage-price-rent freeze ended in November, the CPI has risen at a seasonally adjusted annual rate of 3.3 percent. This compares with a 4.1 percent annual rate of advance in the 6 months preceding the freeze. In the first 8 months of the Economic Stabilization program, which includes the August-November period when most prices were frozen, the CPI rose at an annual rate of 2.8 percent.

## Food

The April food price index, which includes both grocery store food and restaurant meals, decreased 0.1 percent after seasonal adjustment. This decline follows no change in March and an increase of 1.8 percent in February.

The index of food purchased in grocery stores, which usually shows no change in April, declined 0.2 percent. Lower prices for meats, poultry, eggs, and fresh vegetables accounted for the decrease. Beef and veal prices which usually increase slightly in April, declined for the first time since November. Pork prices fell substantially for the second consecutive month. Poultry prices declined for the first time this year. These price declines

NOTE: In accordance with longstanding policy, seasonal adjustment factors have been recalculated to reflect developments during the preceding 12 months. For this reason, some of the seasonally adjusted figures shown above differ from those previously reported. New factors are introduced annually in April. Those to be used through March 1973 can be found on page 20 of this report.
reflected lower wholesale prices and increased production of 9 percent for beef, 11 percent for veal, 22 percent for pork, and 9 percent for poultry from February to March.

Fresh vegetable prices declined contraseasonally in April, as they did in March. Large supplies, especially of asparagus, celery, carrots, and cabbage accounted for the April decline. Fresh fruit prices, however, advanced sharply due to declines in banana imports and also because strawberries were priced for the first time this season. Processed fruits and vegetable prices increased 0.3 percent for the fifth consecutive month. Prices have moved up since November for most items, particularly fruit cocktail, canned beets, dried beans, and pineapplegrapefruit juice. The increase of 0.3 percent this April, however, was considerably smaller than the advance in April of last year. The difference was partly because prices of frozen orange juice held steady in contrast to a sharp advance a year ago in response to short supplies.

Prices rose for cereal and bakery products and dairy products, but the increases were smaller than in February or March. Bread prices were higher, but prices declined for flour and corn flakes. The decline in corn flake prices reflected large supplies of corn. Among dairy products, cheese prices rose sharply as wholesale prices have advanced in response to record levels of consumer demand. On the other hand, ice cream and butter prices decreased as milk production continued to rise. After rising sharply in March, egg prices declined in April due to decreased demand following the Easter holidays and a slight increase in production.

The index for food away from home-restaurant meals and snacks-increased 0.5 percent in April, the largest increase since last August and more than usual for this time of the year. The increase was attributed mostly to the spurt in wholesale food prices which occurred earlier this year.

## Commodities less food

The index for commodities less food increased 0.3 percent, somewhat more than usual for this time of the year. The seasonally adjusted increase of 0.2 percent was about the same as the monthly increases since December. The price rise in apparel commodities, which had accounted for about 40 percent of the March rise in the nonfood commodities index, was responsible for about a third of the April rise in this index.

The index for apparel commodities rose 0.4 percent in April-instead of the usual 0.2 percent-primarily due to a sharper-than-usual increase in men's clothing, particularly year-round and tropical weight suits, wool slacks, and shirts. In March, men's clothing prices increased seasonally after declining from November to

February as they usually do. Women's apparel prices declined in April, slightly more than usual, after advancing sharply in February and March. Footwear prices continued to increase at a faster pace than usual for this time of the year.

A mostly seasonal upturn in used car prices contributed about 40 percent to the April increase in the commodities index. The increase of 2.4 percent in used car prices followed a small rise in March and an almost steady decline from June 1971 through February of this year. Instead of moving down seasonally, new car prices held steady in April as concessions offered by dealers remained at their March levels.

Prices rose in April for most housefurnishings. The increase in textile housefurnishings reflected the end of white sales (in quarterly cities). Prices of most durable housefurnishings also increased, particularly lawnmowers, which were priced for the first time this season, and dinnerware and flatware. The increase at retail for lawnmowers was substantially higher than the wholesale increase since August 1971. Imported Japanese dinnerware prices continued to move higher and some domestic prices followed the upward trend. Prices of floor coverings continued to move up. Price increases for furniture, however, were much smaller than in March. Although demand for furniture was up, some articles were being marketed at promotional prices. Many household appliances were on sale.

Among other nonfood commodities, subscription rates for some magazines rose substantially, and prices increased for newspapers, alcoholic beverages, mostly for beer away from home, and toilet goods such as hand lotion and cleansing tissues.

The rise in the index for nonfood commodities was moderated by a decline in gasoline prices. Despite price "restorations" in several cities, the national gasoline market was weak and severe price wars started in a number of cities.

## Services

Charges for consumer services increased 0.3 percent in April, slightly more than in February and March. Charges for electricity rose 0.9 percent as rate increases were registered in several cities; tax changes and increased fuel costs also contributed to the rise. The residential property tax index rose 0.8 percent, reflecting annual changes for several cities. Prices increased for all services connected with home maintenance. Higher wages caused increases for domestic services, laundry flatwork, and licensed day care service. The April mortgage interest rate index fell 0.5 percent, the largest drop yet in 6 consecutive months of decline.

The index for medical care services rose 0.3 percent, slightly less than the rise of 0.4 percent in each of the previous 4 months. Dentists'fees advanced 0.5 percent. Physicians' fees rose mainly as a result of increased charges for obstetrical care. Charges for hospital services rose 0.3 percent largely because of the increase in rates for semiprivate rooms.

Charges for transportation services increased 0.1 percent in April, as the index for local-transit fares rose 0.5 percent. Recreational service charges also rose as indoor movie admission prices increased 1.1 percent. Legal fees averaged 5.2 percent higher.

## Effect of items identified as exempt from post-freeze regulations

About one-half of the 0.2 percent increase in the April CPI was due to price changes for items identified
as exempt from regulation under Phase II to the Economic Stabilization program. Mortgage interest rates and prices of raw agricultural products declined, while increases occurred in taxes and in the prices of used cars and houses. When the effects of the price changes for these items are removed, the increase in the April index was 0.1 percent. This increase is less than those in the last 2 months and the same as the increase in January.

## Diffusion of individual price changes

Approximately 120,000 individual prices were collected directly by the Bureau of Labor Statistics in April for use in the index. Approximately 80 percent of these quotations represent monthly comparisons. As can be seen from table B, 74 percent of these monthly comparisons remained unchanged, 12 percent decreased, and

| No change | 85 | 86 | 85 | 81 | 74 | 80 | 80 |

[^0]14 percent increased between March and April. The proportion of commodity prices--both food and non-food-which remained unchanged in April was about the same as in the previous month. However, a higher percentage of commodity prices declined and a smaller percentage increased than in the previous month. For services, the proportion of prices remaining unchanged declined and the proportion of services prices decreasing was considerably larger than in March.

The April index also includes more than 23,000 price comparisons to April from periods before March. About 18,000 of these cover the quarterly span from January to April. About 15 percent of these prices increased, about the same as in last month's index. In addition, about 5,000 rental units were surveyed in April, and about 17 percent of these reported rent increases since October. Three percent of the 5,000 reported increases between March and April.

## Brief Explanation of the CPI

The Consumer Price Index (CPI) measures average changes in prices of goods and services usually bought by urban wage earners and clerical workers, both families and single persons living alone. It is based on prices of about 400 items which were selected to represent the movement of prices of all goods and services purchased by wage earners and clerical workers. Prices for these items are obtained in urban portions of 39 Standard Metropolitan Statistical Areas (SMSA's) and 17 smaller cities, which were chosen to represent all urban places in the United States, including Alaska and Hawaii. They are collected from grocery and department stores, hospitals, filling stations, and other types of stores and service establishments which wage earners and clerical workers patronize.

Prices of foods, fuels, and a few other items are obtained every month in all 56 locations. Prices of most other commodities and services are collected every month in the 5 largest SMSA's and every 3 months in other SMSA's and cities. Mail questionnaires are used to obtain local transit fares, public utility rates, newspaper prices, fuel prices, and certain other items which change in price infrequently. Prices of most other goods and services are obtained by personal visits of the Bureau's trained representatives.

In calculating the index, price changes for the various items in each location are averaged together with weights which represent their importance in the spending of all wage earners and clerical workers. SMSA and city data are then combined in the total index with weights based on the 1960 populations of SMSA's and cities they represent. Index numbers are computed on the base 1967=100, and are also available on the base of $1957-59=100$.

The national index (the United States city average) includes prices from the 23 SMSA's for which separate indexes are published in this report, as well as from the following additional locations:

| Alabama - Florence | New Jersey - Millville |
| :--- | :--- |
| Alaska - Anchorage | New York - Kingston |
| California - Bakersfield* | North Carolina - Durham* |
| Colorado - Denver* | North Dakota - Devils Lake |
| Connecticut - Hartford* | Ohio - Dayton* |
| Florida - Orlando* | Ohio - liindlay |
| Indiana - Indianapolis* | Oklahoma - Mangum |
| Indiana - Logansport | Oregon - Klamath IFalls |
| Illinois - Champaign-Urbana* | Pennsylvania - Lancaster* |
| Iowa - Cedar Rapids* | South Carolina - Union |
| Kansas - Wichita* | Tennessee - Nashville* |
| Louisiana - Baton Rouge* | Texas - Austin* |
| Maine - Portland* | Texas - McAllen |
| Massachusetts - Southbridge | Utah - Orem |
| Michigan - Niles | Virginia - Martinsville |
| Minnesota - Crookston | Wisconsin - Green Bay* |
| Mississippi - Vicksburg |  |
|  |  |
| *Standard Metropolitan Statistical Area |  |

Comparisons of indexes for individual SMSA's show only that prices in one location changed more or less than in another. The SMSA indexes cannot be used to measure differences in price levels or in living costs between areas.

A description of the index and historical tables of index numbers for the United States city average and for 23 large SMSA's are available on request to the Bureau of Labor Statistics, Washington, D. C. 20212 or any of its regional offices.

## A Note on Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted changes are usually preferred since they eliminate the effect of changes that normally occur at the same time and in about the same magnitude every year-such as price movements resulting from chang-
ing climatic conditions, production cycles, model changeovers, holidays, and sales.

The unadjusted data are of primary interest to consumers concerned about the prices they actually pay. Unadjusted data are also used extensively for escalation purposes. Many collective bargaining contract agreements and pensions plans, for example, tie compensation changes to the Consumer Price Index unadjusted for seasonal variation.

## Reliability of Percent Changes in the CPI

A system of "replicated" samples introduced into the index structure in the 1964 revision permits an estimate of sampling error for the CPI. ${ }^{1}$ The table below shows standard errors for monthly, quarterly, and

Average standard errors of percent changes in the CPI based on 1971 data

| Component | Standard error |  |  |
| :---: | :---: | :---: | :---: |
|  | Monthly change | Quarterly change | Annual change |
| All items | . 04 | . 06 | . 09 |
| Food at home | . 07 | . 10 | . 15 |
| Food away from home | . 08 | . 14 | . 33 |
| Housing | . 06 | . 10 | . 19 |
| Apparel and upkeep | . 17 | . 27 | . 33 |
| Transportation. | . 11 | . 17 | . 20 |
| Medical care | . 09 | . 14 | . 28 |
| Personal care | . 14 | . 19 | . 34 |
| Reading and recreation | . 09 | . 12 | . 20 |
| Other goods and services. . . . . . | . 11 | . 17 | . 23 |

annual percent changes in the CPI for all items and for nine commodity groupings based on 1971 averages. The figures may be interpreted as follows: The chances
are about 95 out of 100 that the percent change in the CPI as computed differs from the corresponding "complete coverage" change by less than twice the standard error.

Because the CPI is rounded to one decimal place, some ambiguity may arise in interpreting small index changes. As the table indicates, for example, a month-to-month change of 0.1 percent in the all-items CPI is significant. Because of rounding, however, a change of this size in the published index might result from a much smaller change in the unrounded value. Hence, any particular change of 0.1 percent may or may not be significant. On the other hand, a published change of 0.2 percent is almost always significant, regardless of the time period to which it relates.

This replaces the table of average errors based on 1970 data which was included in the CPI report through December 1971.

1 The method of deriving these estimates is described in a paper by Marvin Wilkerson, "Measurement of Sampling Error in the Consumer Price Index,"Journal of the American Statistical Association, September 1967.

## A Note About Calculating Index Changes

Percent changes expressed as annual rates are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12 -month period.

Movements of the indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period while percent changes are not. The following example illustrates the computation of index point and percent changes:

| CPI | 123.8 |
| :--- | ---: |
| less previous index | 123.2 |
| index point differences $=$ | 0.6 |

Index point difference divided by the index for the previous period:

$$
\frac{123.8-123.2}{123.2} \times 100=0.5
$$

Seasonally adjusted percent changes in the U.S. All Items Index are based on seasonal adjustment factors and seasonally adjusted indexes carried to two decimal places. This procedure helps to eliminate rounding error in the percent changes.
