the consumer price index

TY AVERAGE 6 2

1.

for June 1970

U.S. DEPARTMENT OF LABOR BUREAU OF LABOR STATISTICS September 1970

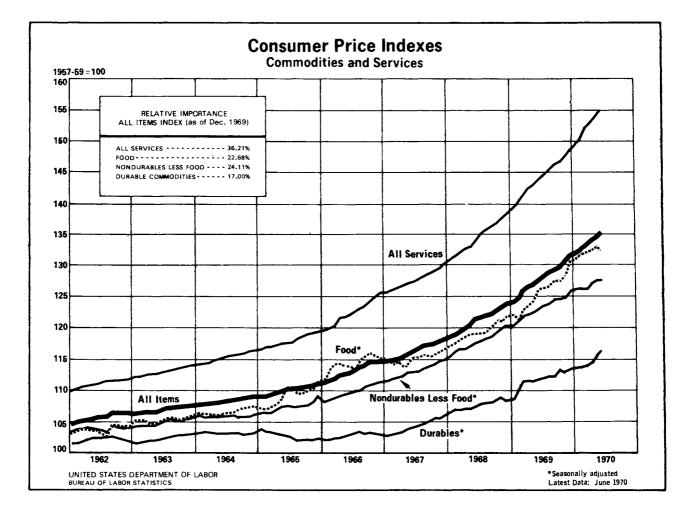

Federal Reserve Bank of St. Louis

U.S. DEPARTMENT OF LABOR J. D. Hodgson, Secretary BUREAU OF LABOR STATISTICS Geoffrey H. Moore, Commissioner

the consumer price index

a monthly report on consumer price movements including statistical tables and technical notes.

THE CONSUMER PRICE INDEX FOR JUNE 1970

The Consumer Price Index rose 0.4 percent in June to 135.2 (1957-59=100). The increase was the same as in May and resulted primarily from higher prices for used cars, homes, and most types of consumer services.

After seasonal adjustment, the CPI rose 0.3 percent--noticeably less than 0.5-percent rate of the previous 2 months. Commodity prices rose significantly less than in May after seasonal adjustment, as food prices declined and the rate of increase in prices of both durables and nondurables other than food both slowed noticeably.

In the 3-month period ending in June, the CPI rose at a seasonally adjusted annual rate of 5.8 percent. This rate compares with one of 6.3 percent recorded for the 3-month periods ending in both March 1970 and December 1969. The slowdown, for the most part, reflected a substantially slower rate of increase in food prices and more moderate rates of advance in charges for some consumer services, particularly mortgage interest costs and transportation services. Prices of commodities other than food rose at a substantially faster pace.

Annual rates of change in the CPI and some of its major components over 3-month periods ending in the last month of each of the last four quarters are given below. All percentage rates, with the exception of those for services, are seasonally adjusted.

	Perc	ent change at a	nnual rate	
	March 1970	Dec. 1969	Sept. 1969	June 1969
	to	to	to	to
	<u>June 1970</u>	<u>March 1970</u>	Dec. 1969	<u>Sept. 1969</u>
	2d Qtr.	lst Qtr.	4th Qtr.	3d Qtr.
All items	5.8	6.3	6.3	5.5
Commodities	5,2	3.7	6.0	4.0
Food	1.3	5.4	10.4	6.1
Nondurables less food	4.7	2.5	4.3	3.8
Durables	8.1	3.0	4.8	2.1
Services	7.3	11.2	6.5	7.8

Note: The above values are subject to change when new seasonal factors are introduced.

Durables

Retail prices of consumer durable goods rose substantially more than seasonally in June, largely because of continued strength in prices of both used cars and houses. Prices of used cars averaged 3-1/2 percent higher following an even larger rise in May while prices of new cars dropped seasonally. Prices of most household appliances, with the exception of radio and television sets, were appreciably higher in June.

In the first half of this year price increases for consumer durables amounted to 2.7 percent; most of this rise--2.3 percent--resulted from large increases in used-car prices during the second quarter. Compared with June 1969, prices of durables were up 4.5

percent; the greatest part of this increase was due to significantly higher prices for houses.

Food

In June, retail food prices averaged 0.2 percent higher than in May as prices of food at home increased 0.2 percent and prices of food away from home advanced 0.4 percent. On a seasonally adjusted basis food prices fell, by 0.4 percent, the first decline in 2 years.

During June, prices of fruits and vegetables rose 1.9 percent, due mostly to large increases for prices of apples, watermelons, potatoes, celery, grapefruit, cabbage, and tomatoes. Sharp price dips for green peppers, lettuce, and cucumbers partially offset the rise in most other fruit and vegetable prices. Increased prices of canned milk were primarily responsible for the 2-percent increase in prices for dairy products. Rises in prices for cream sandwich cookies and cracker meal advanced cereals and bakery products prices the same amount.

Meat, poultry, and fish prices decreased contraseasonally in June as the price of almost all cuts of beef and pork dropped. Only frying chicken and porterhouse steak showed increases. The price of eggs fell almost 6 percent; fresh coffee prices rose 1.7 percent.

Over the 3-month period ending in June, food prices increased at an annual rate of 1.3 percent compared with 5.4 percent for the 3-month period ending in March and 10.4 percent for the 3-month period ending in December.

Services

Charges for consumer services rose 0.6 percent in June, and accounted for almost half of the total rise in the overall index. Automobile services, doctors and dentists fees, mortgage interest costs, and home maintenance and repair services were primarily responsible for the continued increase in prices of services.

For the 3-month period ending in June, the increase in service prices was at an annual rate of 7.3 percent, quite a bit less than the 11.2-percent increase in the first quarter. The increase from June 1969 to June 1970, however, was 8.2 percent, the largest yearly increase in over 10 years.

The yearly rise in the cost of services stems mainly from advances in household services, particularly mortgage interest charges, and transportation services. Continued high demand for living quarters, together with the shortage of loanable funds, has pushed mortgage interest costs up by about 20 percent since June 1969; another consequence of the strong demand for housing is the 4.1-percent rise in residential rents. Automobile service prices have shown a 9.7-percent rise due to increased costs for both labor and parts.

Nondurable Goods other than Food

Retail prices of nondurable goods other than food rose 0.2 percent in June; apparel prices, which accelerated from their pace in May, accounted for 40 percent of the rise. Tobacco products rose 0.9 percent, reflecting an increase in wholesale prices in June. Gasoline prices decreased 0.8 percent as a result of price cuts in Los Angeles and a resumption of price wars in Detroit, San Francisco, and other areas.

Despite acceleration in the second quarter, the 12-month rise in retail prices of nondurable commodities other than food in June, 3.8 percent, was the smallest such gain since May 1968 and compares with an increase of 4.6 percent in the similar period ending in June 1969.

2

A NOTE ABOUT CALCULATING INDEX CHANGES

Effective with the February 1970 release, and continuing thereafter, percentage changes expressed as annual rates will be computed according to the standard formula for compound growth rates. These data indicate what the percentage change would be if the current rate were maintained for a 12-month period.

Movements of the indexes from one date to another are usually expressed as percentage changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period while percentage changes are not. The following example illustrates the computation of index point and percentage changes:

Index point change		Percentage change
June 1970 CPI (1957-59=100) less May 1970 index Index point difference ⇒	135.2 134.6 0.6	Index point difference divided by the index for the previous period: <u>135.2 - 134.6</u> x 100 = 0.4 <u>134.6</u>

(Unadjusted, unless otherwise indicated)

1/ Area coverage includes the urban portion of the corresponding Standard Metropolitan Statistical Area (SMSA) except for New York and Chicago where the more extensive Standard Consolidated Areas are used. Area definitions are those established for the 1960 Census and do not include revisions made since 1960.

2/ Foods, fuels, and several other items priced every month in all cities; most other goods and services priced as indicated:

M - Every month.

January, April, July, and October.
 February, May, August, and November.
 March, June, September, and December.

Note: The Consumer Price Index cannot be used for measuring differences in living costs among areas; it indicates price change within areas. Estimates of differences in living costs among areas are found in the family budgets.

11/ Also includes outboard motors, nondurable toys, college tuition fees, paperback books, and college textbooks, not shown separately.

Reliability of Percent Changes in the CPI

A system of "replicated" samples introduced into the index structure in the 1964 revision permits an estimate of sampling error for the CPI. <u>1</u>/ The table below shows standard errors for monthly, quarterly, and annual <u>percent changes</u> in the CPI for all items and for nine commodity groupings based on 1969 averages. The figures may be interpreted as follows: the chances are about 95 out of 100 that the percent change in the CPI as computed differs from the corresponding "complete coverage" change by less than twice the standard error. Data also are shown in terms of the relative error of the standard error of percent changes. The relative errors tend to decrease markedly for successively longer time periods, as expected.

Because the CPI is rounded to one decimal place, some ambiguity may arise in interpreting small index changes. The table below indicates, for example, that a monthto-month change of 0.1 percent in the all-items CPI is significant. Because of rounding, however, a change of this size in the published index might result from a much smaller change in the unrounded value. Hence, any particular change of 0.1 percent may or may not be significant. On the other hand, a published change of 0.2 percent is almost always significant, regardless of the time period to which it relates.

		Standard E	rror	Relative Error		
Component	Monthly Change	Quarterly Change	Annual Change	Monthly Change	Qua rte rly Change	Annual Change

Standard and Relative Errors of Percent Changes in the CPI Based on 1969 Data

This replaces the table of average errors based on 1968 data which was included in the CPI report through December 1969.

<u>1</u>/ The method of deriving these estimates is described in a paper by Marvin Wilkerson, "Measurement of Sampling Error in the Consumer Price Index," <u>Journal of the American</u> Statistical Association, September 1967.

Brief Explanation of the CPI

The Consumer Price Index (CPI) measures average changes in prices of goods and services usually bought by urban wage earners and clerical workers, both families and single persons living alone. It is based on prices of about 400 items which were selected to represent the movement of prices of all goods and services purchased by wage earners and clerical workers. Prices for these items are obtained in urban portions of 39 Standard Metropolitan Statistical Areas (SMSA's) and 17 smaller cities, which were chosen to represent all urban places in the United States, including Alaska and Hawaii. They are collected from grocery and department stores, hospitals, filling stations, and other types of stores and service establishments which wage earners and clerical workers patronize.

Prices of foods, fuels, and a few other items are obtained every month in all 56 locations. Prices of most other commodities and services are collected every month in the 5 largest SMSA's and every 3 months in other SMSA's and cities. Mail questionnaires are used to obtain local transit fares, public utility rates, newspaper prices, fuel prices, and certain other items which change in price infrequently. Prices of most other goods and services are obtained by personal visits of the Bureau's trained representatives.

In calculating the index, price changes for the various items in each location are averaged together with weights which represent their importance in the spending of all wage earners and clerical workers. SMSA and city data are then combined in the total index with weights based on the 1960 populations of SMSA's and cities they represent. Index numbers are computed on the base 1957-59=100, and are also available on the bases of 1947-49=100 and 1939=100.

The national index (the United States city average) includes prices from the 23 SMSA's for which separate indexes are published in this report, as well as from the following additional locations:

Alabama - Florence	Louisiana - Baton Rouge*	Ohio - Findlay
Alaska - Anchorage	Maine - Portland*	Oklahoma - Mangum
California - Bakersfield*	Massachusetts – Southbridge	Oregon - Klamath Falls
Colorado - Denver*	Michigan - Niles	Pennsylvania - Lancaster*
Connecticut - Hartford*	Minnesota - Crookston	South Carolina - Union
Florida - Orlando*	Mississippi - Vicksburg	Tennessee - Nashville*
Indiana - Indianapolis*	New Jersey - Millville	Texas - Austin*
Indiana - Logansport	New York - Kingston	Texas - McAllen
Illinois - Champaign-Urbana*	North Carolina - Durham*	Utah - Orem
Iowa - Cedar Rapids*	North Dakota - Devils Lake	Virginia – Martinsville
Kansas - Wichita*	Ohio - Dayton*	Wisconsin - Green Bay*

*Standard Metropolitan Statistical Area

Comparisons of indexes for individual SMSA's show only that prices in one location changed more or less than in another. The SMSA indexes cannot be used to measure differences in price levels or in living costs between areas.

A description of the index and historical tables of index numbers for the United States city average and for 23 large SMSA's are available on request to the Bureau of Labor Statistics, Washington, D. C. 20212 or any of its regional offices (addresses below).
