Price Movements November 1972

The Consumer Price Index rose 0.2 percent in November, to 126.9 percent of its (1967=100) base. Almost two-thirds of the rise was due to higher prices for food, apparel, and residential gas. The November index, was 3.5 percent higher than it was a year ago.

After seasonal adjustment, the November increase was 0.3 percent. In the 6-month period ending in November, the CPI rose at a seasonally adjusted annual rate of 3.6 percent. Prices in the last 3 months of the period rose at a 4.2-percent rate, compared with 2.9 percent in the first 3 months. The larger advance in the last 3 months is attributable to the food price index which in November rose 1.1 percent on a seasonally adjusted basis, following increases of 0.2 percent in October and 0.6 percent in September. After seasonal adjustment, the nonfood commodities index increased 0.1 percent, compared with a decrease of 0.1 percent in October and a rise of 0.4 percent in September. The November increase of 0.2 percent for services was smaller than the 0.4-percent rise in October and the same as in September.

During the first year of Phase II of the Economic Stabilization Program, the CPI rose 3.5 percent. This rate compares with a rise of 3.8 percent at a seasonally adjusted annual rate in the 8 months of 1971 before the start of Phase I.

The index of food purchased in grocery stores increased 0.5 percent. It usually decreases 1.0 percent in November. The index of food away from home—restaurant meals and snacks—increased 0.4 percent.

Fresh vegetable prices rose even more sharply than usual as reduced fall planting acreage for some items, adverse growing and harvesting weather, and a shift in the source of supplies from summer producing areas to winter producing areas curtailed supplies in November. Meat prices, which normally decline appreciably at this season, increased on average. Prices of most beef cuts rose despite earlier price decreases at the wholesale level; pork prices declined but by significantly less than usual. Bread and flour prices advanced, because of recent increases in wheat and flour prices which manufacturers

Table B. Comparative seasonally adjusted annual rates of change in the CPI and its major components before and during the Economic Stabilization Program.

Group	1971 before Phase I (December 1970 to August 1971)	3 months Phase I (August 1971 to November 1971)	12 months Phase II (November 1971 to November 1972)	15 months Phase I and IL (August 1971 to November 1972)
All items	3.8	1.9	3.5	3.2
Food	5.0	1.7	5.4	4.7
Commodities less food	2.9	0	2.5	2.0
Services	4.5	3.1	3.5	3.5

have been allowed by the Price Commission to pass on to the retail level. Prices of eggs and fresh fruits declined, but less than seasonally for November; poultry prices decreased a little more than usual. Dairy product prices were also higher in November, apparently because of a decline in fluid milk supplies.

The nonfood commodities index rose 0.2 percent before seasonal adjustment in November. Over half of the rise was due to price increases for apparel, particularly for items of fall and winter clothing priced for the first time this season in several cities. Some items of year-round clothing also showed price increases in November; prices of footwear continued to rise.

Used car prices rose again in November, but by substantially less than in the 2 preceding months. Prices of new cars increased, continuing to reflect the introduction of 1973 models. The increase was smaller than usual for November and the smallest November rise since 1963. As in October, substantial quality improvements related to Federal safety and environmental requirements, and the fact that list price increases on new models had been largely disallowed by the Price Commision, combined to hold down the rise in new car prices. Higher prices were recorded for furniture, housekeeping supplies, home maintenance and repair commodities and houses. Gasoline and tire prices, however, declined.

The services index rose 0.2 percent. Medical care services increased 0.1 percent in November following a 0.7-percent rise in October when the regular annual adjustment to the health insurance component was made. Rents rose less than in recent months. Charges for residential gas rose sharply as a result of changeovers to winter rates in several areas and rate increases in others. Most other household services, such as water and sewerage charges, mortgage interest rates, and charges for domestic and day care services, also were higher. Transportation services prices rose, following a slight decline in October, as increases were reported in auto insurance rates, parking and registration fees, and maintenance and repair costs.

Diffusion of individual price changes

Approximately 120,000 individual prices were collected directly by the Bureau of Labor Statistics in Noember for use in the index. Approximately 80 percent of these quotations represent monthly comparisons. As can be seen from table C, 75 percent of these monthly comparisons remained unchanged, 11 percent decreased, and 14 percent increased between October and November. The proportion of nonfood commodity prices increasing was the same as in October and less than in September. The November index also includes 23,000 price comparisons to November from periods before October. of which 18,500 cover the quarterly span from August to November. About 14 percent of these increased, compared with about 15 percent in last month's index. In addition, about 4,500 rental units were surveyed in November and 20 percent of these reported rent increases from May.

Introduction of additional series on food prices

Effective with release of the Consumer Price Index (CPI), for November 1972, the Bureau of Labor Statistics has initiated monthly publication of two additional index series. The additional series, entitled (1) domestically produced farm foods and (2) selected beef cuts, are derived from existing index data and published monthly in table 1 of the CPI press release and detailed report.

As well as being published by BLS, the new series will be used by the Economic Research Service of the U.S. Department of Agriculture in its monthly report, Price Spreads for Farm Foods and in the Marketing and Transportation Situation. The new BLS series on domestically produced farm foods will serve as the basis for estimating changes in the retail value of U.S. farm foods in these publications. The series for domestically produced farm foods is calculated by excluding the following items from the food-at-home component of the

Regulations of the Economic Stabilization Program permit certain types of increases, but it is not possible to determine whether allowable increases accounted for all increases shown in the table.

Based on approximately 98,000 individual quotations.

CPI: fish, nonalcoholic beverages, bananas, chocolate candy bars, chocolate syrup, and about half of the index weight for sugar. These exclusions are items which are not produced on U.S. farms. The new series for selected beef cuts is calculated by excluding veal cutlets and beef liver from the CPI for beef and veal. The new indexes are on the current reference base, 1967=100. Data for the new series covering the period from November 1971 appear in the following tabulation:

	Domestically produced farm foods	Selected beef cuts
November 1971	116.1	126.0
December	117.9	127.5
January 1972	117.8	130.6

¹ Area coverage includes the urban portion of the corresponding Standard Metropolitan Statistical Area (SMSA) except for New York and Chicago where the more extensive Standard Consolidated Areas are used. Area definitions are those established for the 1960 Census and do not include revisions made since 1960.

2 Foods, fuels, and several other items priced every month in all cities; most other goods and services priced as indicated:

M = Every month.

1 = January, April, July, and October.

2 = February, May, August, and November.

3 = March, June, September, and December.

3 November 1963 = 100.

4 February 1965 = 100.

5 December 1963 = 100.

NOTE: The Consumer Price Index cannot be used for measuring differences in living costs among areas; it indicates price change within areas. Estimates of differences in living costs among areas are found in the family budgets.

Brief Explanation of the CPI

The Consumer Price Index (CPI) measures average changes in prices of goods and services usually bought by urban wage earners and clerical workers. It is based on prices of about 400 items which were selected to represent the movement of prices of all goods and services purchased by wage earners and clerical workers. Prices for these items are obtained in urban portions of 39 major statistical areas and 17 smaller cities, which were chosen to represent all urban places in the United States. They are collected from about 18,000 establishments—grocery and department stores, hospitals, filling stations, and other types of stores and service establishments.

Prices of foods, fuels, and a few other items are obtained every month in all 56 locations. Prices of most other commodities and services are collected every month in the five largest areas and every 3 months in other areas. Prices of most goods and services are obtained by

personal visits of the Bureau's trained representatives. Mail questionnaires are used to obtain local transit fares, public utility rates, newspaper prices, fuel prices, and certain other items.

In calculating the index, price changes for the various items in each location are averaged together with weights which represent their importance in the spending of all wage earners and clerical workers. Local data are then combined to obtain a U.S. city average. Separate indexes are also published for 23 areas.

The index measures price changes from a designated reference date—1967—which equals 100.0. An increase of 22 percent, for example, is shown as 122.0. This change can also be expressed in dollars as follows: The price of a base period "market basket" of goods and services bought by urban wage earners and clerical workers has risen from \$10 in 1967 to \$12.20.

A Note on Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted changes are usually preferred, since they eliminate the effect of changes that normally occur at the same time and in about the same magnitude every year such as price movements resulting from changing

climatic conditions, production cycles, model changeovers, holidays, and sales.

The unadjusted data are of primary interest to consumers concerned about the prices they actually pay. Unadjusted data also are used extensively for escalation purposes. Many collective bargaining contract agreements and pension plans, for example, tie compensation changes to the Consumer Price Index unadjusted for seasonal variation.

Reliability of Percent Changes in the CPI

A system of "replicated" samples introduced into the index structure in the 1964 revision permits an estimate of sampling error for the CPI. The table below shows standard errors for monthly, quarterly, and

Average standard errors of percent changes in the CPI based on 1971 data

	Standard error							
Component	Monthly	Quarterly	Annual					
	change	change	change					
All items	.04	.06	.09					
Food at home	.07	.10	.15					
Food away from								
home	.08	.14	.33					
Housing	.06	.10	.19					
Apparel and upkeep	.17	.27	.33					
Transportation	.11	.17	.20					
Medical care	.09	.14	.28					
Personal care	.14	.19	.34					
Reading and								
recreation	.09	.12	.20					
Other goods and								
services	.11	.17	.23					

are about 95 out of 100 that the percent change in the CPI as computed differs from the corresponding "complete coverage" change by less than twice the standard error.

Because the CPI is rounded to one decimal place, some ambiguity may arise in interpreting small index changes. As the table indicates, for example, a month-to-month change of 0.1 percent in the all-items CPI is significant. Because of rounding, however, a change of this size in the published index might result from a much smaller change in the unrounded value. Hence, any particular change of 0.1 percent may or may not be significant. On the other hand, a published change of 0.2 percent is almost always significant, regardless of the time period to which it relates.

This replaces the table of average errors based on 1970 data which was included in the CPI report through December 1971.

annual percent changes in the CPI for all items and for nine commodity groupings based on 1971 averages. The figures may be interpreted as follows: The chances

A Note About Calculating Index Changes

Percent changes expressed as annual rates are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Movements of the indexes from 1 month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period while percent changes are not. The following example illustrates the computation of index point and percent changes:

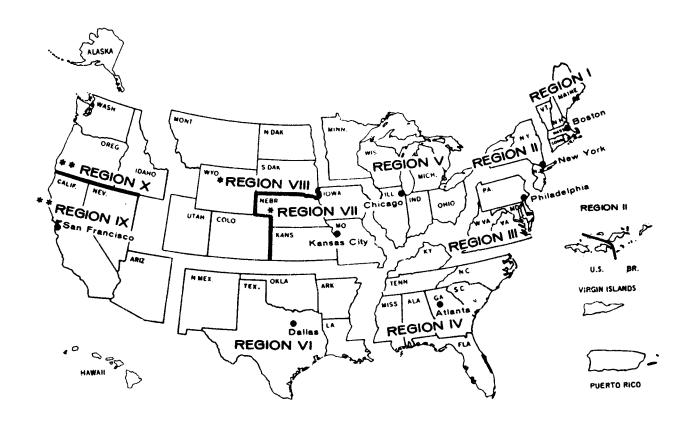

Index point difference divided by the index for the previous period:

$$\frac{123.8 - 123.2}{123.2} \times 100 = 0.5$$

Seasonally adjusted percent changes in the U.S. All Items Index are based on seasonal adjustment factors and seasonally adjusted indexes carried to two decimal places. This procedure helps to eliminate rounding error in the percent changes.

¹ The method of deriving these estimates is described in a paper by Marvin Wilkerson, "Measurement of Sampling Error in the Consumer Price Index," Journal of the American Statistical Association, September 1967.
