# Price Movements

February 1975

The Consumer Price Index rose 0.7 percent in February to 157.2 percent of its 1967 base. Increases in a wide range of goods and services, including medical care services, utilities, rent, houses, clothing, fresh fruits and vegetables, and products containing sugar accounted for the rise in the February CPI. The effect of these increases was partially offset by lower prices for meats, sugar, and used cars.

In February 1975, the CPI was 11.1 percent higher than in February 1974. The food index was 8.9 percent, the nonfood commodities index 12.2 percent, and the services index 11.5 percent above their levels of February 1974.

## Seasonally adjusted changes

On a seasonally adjusted basis, the rise in the February CPI was 0.6 percent, the same as in January. The rise in food prices was much smaller than in January, but the increase in nonfood commodities was larger. The CPI rose 0.7 percent in December, and 0.9 percent in both November and October.

The food index rose 0.1 percent in February after seasonal adjustment, much less than in January and the smallest increase in 7 months. The slowdown in February was primarily due to declines in beef, pork, poultry, and sugar prices. Prices of sugar-based products,

however, continued to rise rapidly. Prices of most other grocery store foods—notably fresh fruits and vegetables and eggs—and prices of restaurant meals also rose in February.

The nonfood commodities index rose 0.8 percent after seasonal adjustment. Although larger than in either of the 2 preceding months, the February increase was less than increases in the first 9 months of 1974. The new car index, which declined in December and January, rose in February, to reflect higher prices for imported cars. The index for apparel commodities also increased following 2 months of decline. Prices of many other commodities, particularly nondurable goods, continued to rise rapidly. Increases in prices of household durables, however, were smaller than in recent months.

The index for services increased 0.8 percent in February, about the same as in each of the preceding 4 months. Charges for medical care services and utilities continued to rise rapidly in February, while increases in charges for home repair and personal care services were smaller than in recent months, and mortgage interest rates continued to decline.

#### Monthly changes in detail (not seasonally adjusted)

**Food.** The index for food purchased in grocery stores—the major portion of the food index—rose 0.4 percent, slightly less than the usual seasonal increase for February. A large part of the increase was due to higher prices for fresh fruits and vegetables and products which contain sugar. Prices of dairy products rose slightly. The effect of these increases was partially offset by declines in sugar, beef, pork, and poultry prices.

Fresh fruit and vegetable prices rose more than they usually do in February. Banana prices rose sharply because of reduced imports caused by storm damage in Central America. Higher prices for oranges reflected the earlier effects of uncertainty in wholesale markets due to freeze damage to the California and Texas crops. Reduced planting in winter producing areas as well as gaps in production caused by a shift in harvesting to different areas resulted in higher prices for fresh vegetables such as lettuce, tomatoes, carrots, and cabbage. Prices of most processed fruits and vegetables continued to rise because of smaller pack last fall, increases in sugar prices last year, and higher processing and distribution costs. However, the effect of these increases was more than offset by sharp declines in dried bean prices from the record levels of 1974.

The rise in prices of dairy products was partly due to the January increase in the U.S. support prices of milk used in butter, cheese, and nonfat dry milk. USDA raised

the support level for manufacturing milk to \$7.24 per 100 pounds effective January 4, 1975, up 10 percent from the previous \$6.57 level. The new support price will remain in effect through the marketing year which ends March 1976. (See *Dairy Situation*, Economic Research Service, Department of Agriculture, March 1975.) Rising demand also contributed to the rise in butter prices and higher ingredient costs—particularly sugar—to the rise in ice cream prices.

Prices of other products which contain sugar—such as bakery products, candy bars, and nonalcoholic beverages—continued to rise rapidly as manufacturers used their inventories of high-priced sugar. Sugar prices, however, continued to decline in response to lower prices at the wholesale level. In the first 2 months of 1975, sugar prices at the retail level declined a total of 14.5 percent, but were still more than 200 percent higher than a year earlier. At wholesale, prices of 5 pound-bags of granulated sugar declined about 20 percent from December 1974 to February, but they were still 178 percent higher than in February 1974. Raw sugar prices in February were down about 30 percent from the November 1974 peak but they were about 150 percent higher than in February 1974.

Beef, pork, and poultry prices declined in February instead of moving up seasonally. Heavy marketings of cattle and hogs and increased poultry slaughter in January contributed to the February declines in prices for meats and poultry. In addition, declines in pork and poultry prices would appear to reflect competitive pressures from the steady and large declines in beef prices since September. Egg prices also declined in February but not as much as they usually do.

The index for food away from home—restaurant meals and snacks—increased 0.9 percent in February, about the same as in recent months.

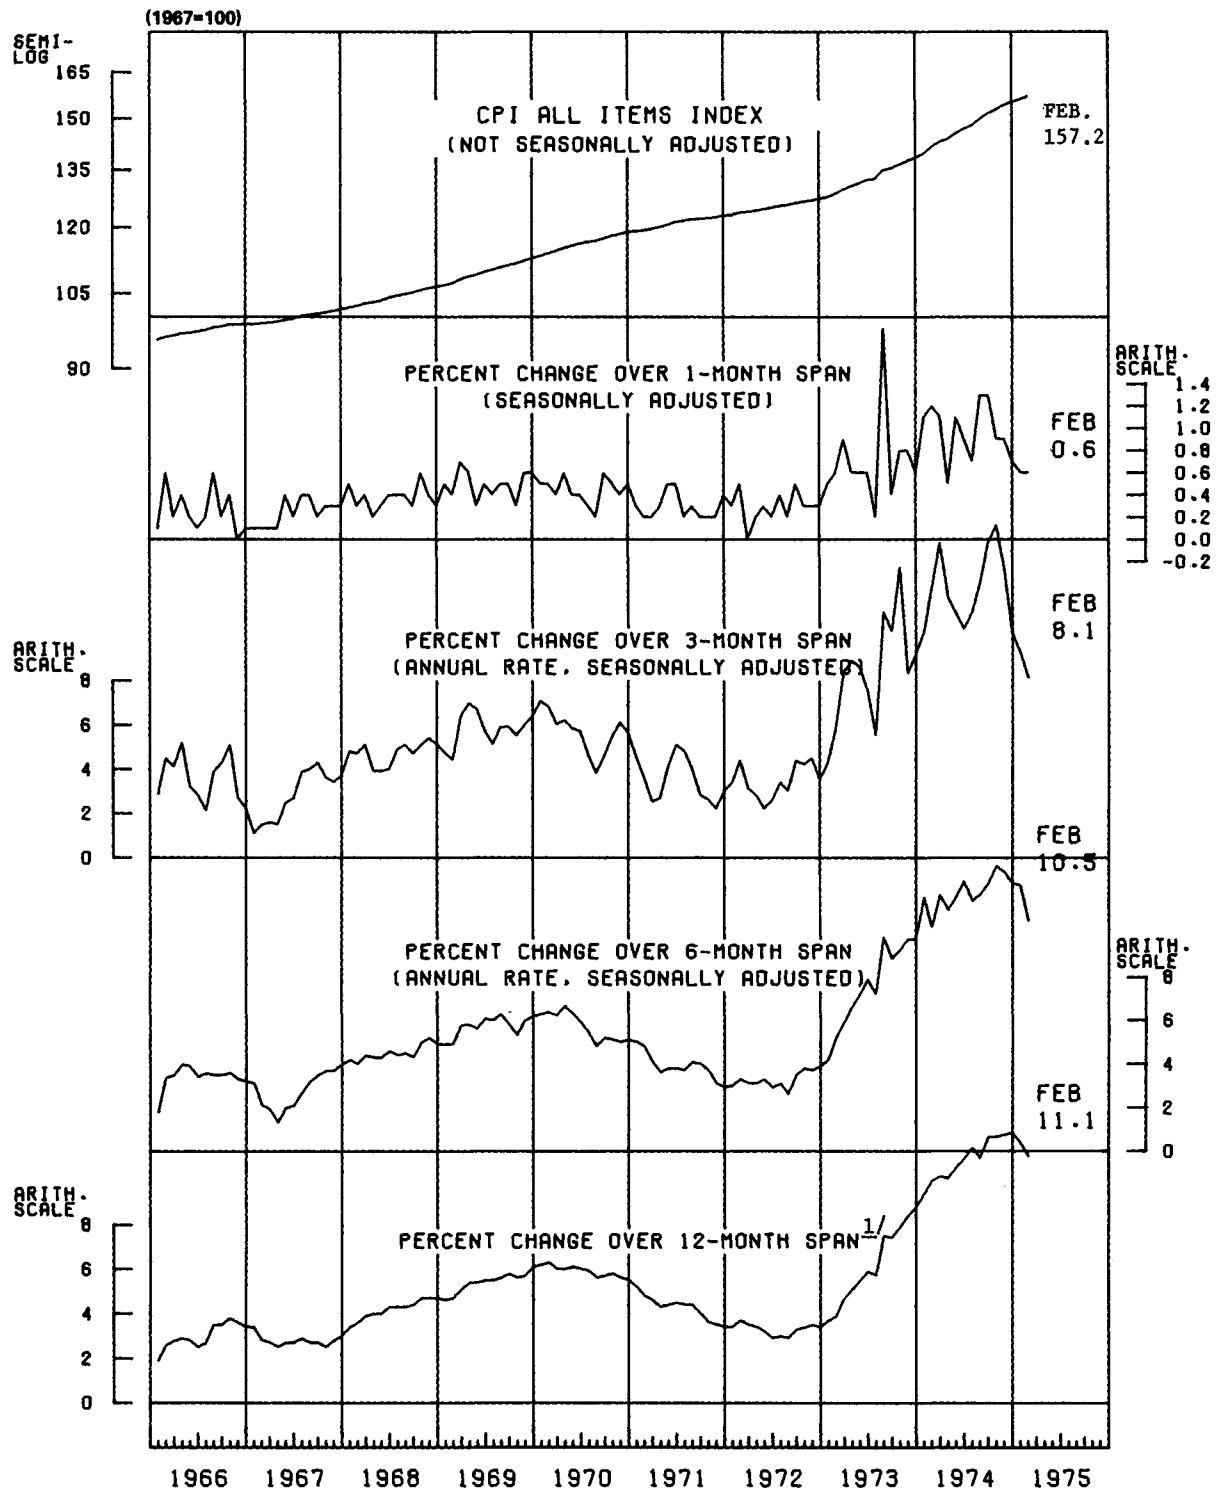

**Nonfood commodities.** The index for nonfood commodities increased 0.7 percent instead of decreasing slightly as it usually does in February. Increases were widespread, particularly for nondurable goods. The apparel index rose somewhat more than is usual in February, as a result of higher introductory prices for spring items and end of clearance sales on some other items. Largest increases occurred among men's and boys' clothing and in prices of women's footwear. Prices of textile housefurnishings rose sharply following the end of traditional January white sales. Continued large increases in prices of housekeeping supplies, alcoholic beverages, toilet goods, drugs and prescriptions, and tobacco products reflect higher materials and packaging costs as well as relatively strong demand. Fuel oil and

gasoline prices also increased. (See table 10 for gasoline prices and indexes in 23 urban areas.)

Among durable goods, the index for new cars rose instead of moving down as it usually does in February. The increase was primarily due to higher prices for new model imported cars. Prices of most domestic models decreased because of larger dealer concessions and continuation of rebate programs begun in January. The used car index continued to decline, but less than in December or January. There were also increases in prices of houses, appliances, recreational goods, dinnerware, and flatware.

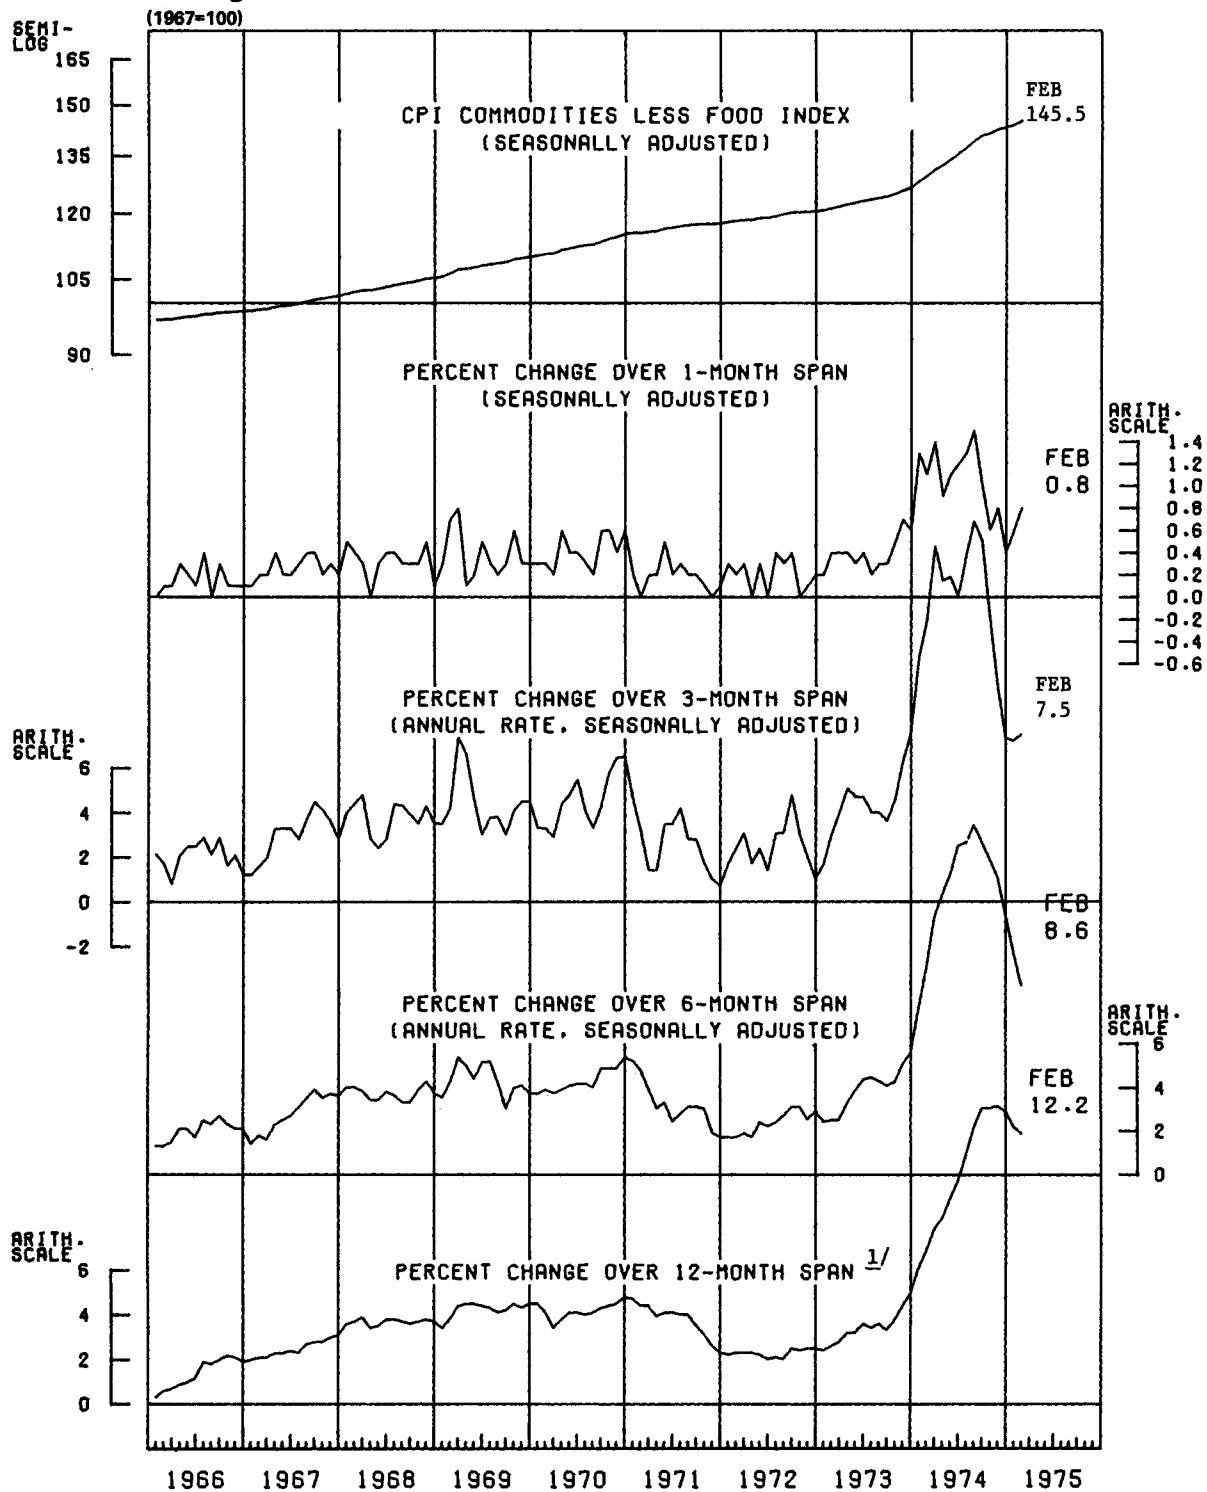

*Services.* The services index rose 0.8 percent in February. Almost a fourth of the rise resulted from higher charges for medical care services—both physicians' fees and hospital services. Charges for all types of household services, except mortgage interest rates, increased. Higher fuel costs continued to be a primary source in the rise of gas and electricity bills. The January increase in minimum wages accounted in part for the increase in house-keeping charges. Increases in home maintenance and repair services, however, reflecting lower prices for materials and decreased demands.

<sup>1</sup> Area coverage includes the urban portion of the corresponding Standard Metropolitan Statistical Area (SMSA) except for New York and Chicago where the more extensive Standard Consolidated Areas are used. Area definitions are those established for the 1960 Census and do not include revisions made since 1960.

<sup>2</sup> Foods, fuels, and several other items priced every month in all cities; most other goods and services priced as indicated:

M - Every month.

1 - January, April, July, and October.

2 - February, May, August, and November.

3 - March, June, September, and December.

<sup>3</sup> November 1963=100.

<sup>4</sup> February 1965=100.

<sup>5</sup> December 1963=100.

NOTE: The Consumer Price Index cannot be used for measuring differences in living costs among areas; it indicates price change within areas. Estimates of differences in living costs among areas are found in the family budgets.

## Brief Explanation of the CPI

The Consumer Price Index (CPI) measures average changes in prices of goods and services usually bought by urban wage earners and clerical workers. It is based on prices of about 400 items which were selected to represent the movement of prices of all goods and services purchased by wage earners and clerical workers. Prices for these items are obtained in urban portions of 39 major statistical areas and 17 smaller cities, which were chosen to represent all urban places in the United States. They are collected from about 18,000 establishments—grocery and department stores, hospitals, filling stations, and other types of stores and service establishments.

Prices of foods, fuels, and a few other items are obtained every month in all 56 locations. Prices of most other commodities and services are collected every month in the five largest areas and every 3 months in other areas. Prices of most goods and services are obtained by

personal visits of the Bureau's trained representatives. Mail questionnaires are used to obtain local transit fares, public utility rates, newspaper prices, fuel prices, and certain other items.

In calculating the index, price changes for the various items in each location are averaged together with weights which represent their importance in the spending of all wage earners and clerical workers. Local data are then combined to obtain a U.S. city average. Separate indexes are also published for 23 areas.

The index measures price changes from a designated reference date—1967—which equals 100.0. An increase of 22 percent, for example, is shown as 122.0. This change can also be expressed in dollars as follows: The price of a base period "market basket" of goods and services bought by urban wage earners and clerical workers has risen from \$10 in 1967 to \$12.20.

## A Note About Calculating Index Changes

Movements of the indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period while percent changes are not. The example in the accompanying box illustrates the computation of index point and percent changes.

Seasonally adjusted percent changes in the U.S. All Items Index are based on seasonal adjustment factors and seasonally adjusted indexes carried to two decimal places. This procedure helps to eliminate rounding error in the percent changes.

Percent changes for 3-month and 6-month periods are expressed as annual rates and are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month

period. BLS does not publish annual rates based on data for 1 month.

<i>Index Point Change</i>	
CPI	123.8
Less previous index	<u>123.2</u>
Equals index point change:	0.6
<i>Percent Change</i>	
Index point difference,	<u>0.6</u>
Divided by the previous index,	123.2
Equals,	0.005
Results multiplied by one hundred	0.005×100
Equals percent change:	0.5

## A Note on Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted changes are usually preferred, since they eliminate the effect of changes that normally occur at the same time and in about the same magnitude every year—such as price movements resulting from changing

climatic conditions, production cycles, model changeovers, holidays, and sales.

The unadjusted data are of primary interest to consumers concerned about the prices they actually pay. Unadjusted data are also used extensively for escalation purposes. Many collective bargaining contract agreements and pension plans, for example, tie compensation changes to the Consumer Price Index unadjusted for seasonal variation.

## Reliability of Percent Changes in the CPI

A system of "replicated" samples introduced into the index structure in the 1964 revision permits an estimate of sampling error for the CPI.<sup>1</sup> The table below shows standard errors for monthly, quarterly, and annual

**Average standard errors of percent changes in the CPI based on 1974 data**

Component	Standard error		
	Monthly change	Quarterly change	Annual change
All items . . . . .	.05	.07	.12
Food at home . . . . .	.10	.19	.40
Food away from home . . . . .	.13	.23	.42
Housing . . . . .	.09	.15	.23
Apparel and upkeep . . . . .	.21	.28	.33
Transportation . . . . .	.07	.10	.20
Medical care . . . . .	.16	.21	.28
Personal care . . . . .	.19	.24	.34
Reading and recreation . . . . .	.16	.21	.27
Other goods and services . . . . .	.13	.18	.28

percent changes in the CPI for all items and for nine commodity groupings based on 1974 averages. The figures may be interpreted as follows: The chances are about 95 out of 100 that the percent change in the CPI as computed differs from the corresponding "complete coverage" change by less than twice the standard error.

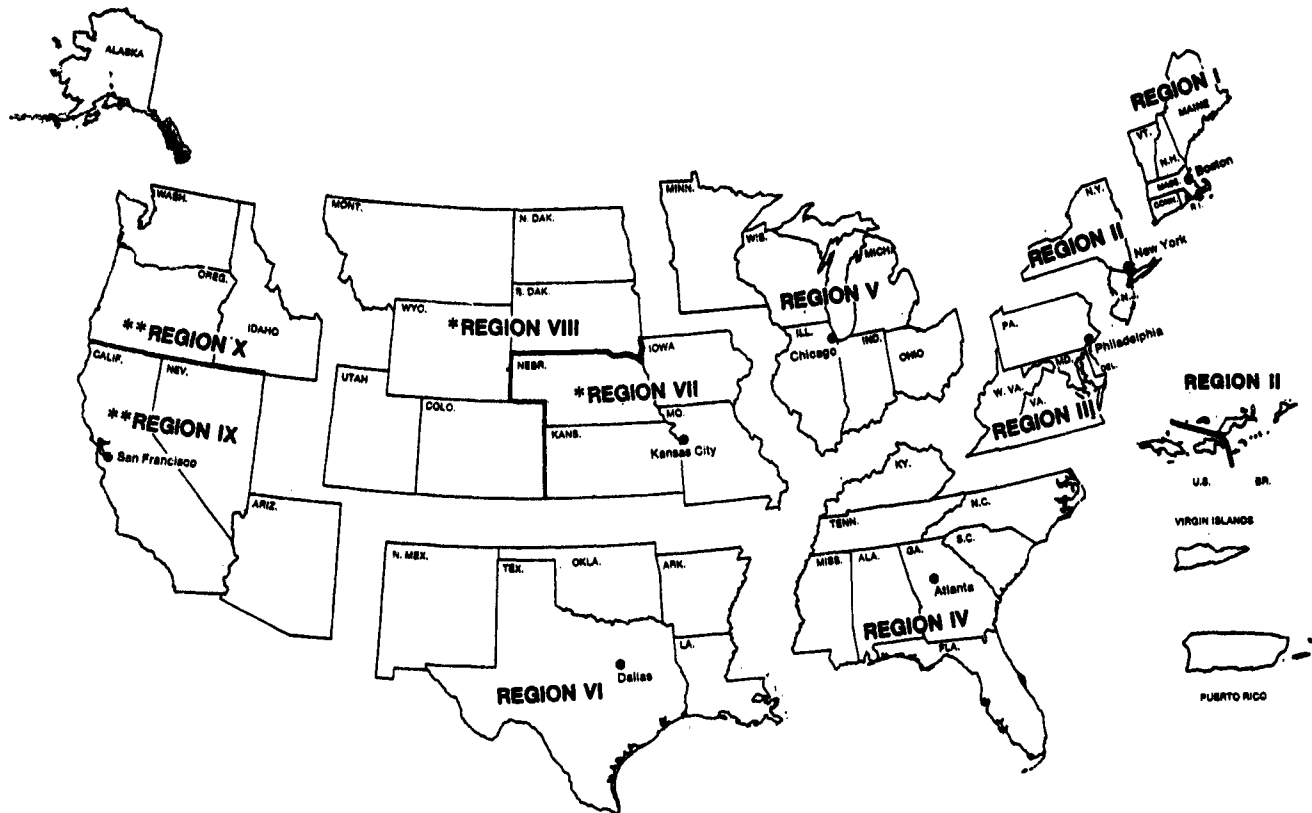

Because the CPI is rounded to one decimal place, some ambiguity may arise in interpreting small index changes. As the table indicates, for example, a month-to-month change of 0.1 percent in the all-items CPI is significant. Because of rounding, however, a change of this size in the published index might result from a much smaller change in the unrounded value. Hence, any particular change of 0.1 percent may or may not be significant. On the other hand, a published change of 0.2 percent for a one-month period is almost always significant.

This replaces the table of average errors based on 1973 data which was included in the CPI report through January 1975.

<sup>1</sup> The method of deriving these estimates is described in a paper by Marvin Wilkerson, "Measurement of Sampling Error in the Consumer Price Index," *Journal of the American Statistical Association*, September 1967.
