# Price Movements <br> May 1976 

The Consumer Price Index rose 0.6 percent in May before seasonal adjustment to 169.2 percent of its 1967 base. The CPI in May was 6.2 percent higher than in May 1975.

## Seasonally adjusted changes

On a seasonally adjusted basis, the CPI rose 0.6 percent in May. This compares with an increase of 0.4 percent in April, 0.2 percent in March, and 0.1 percent in February. The acceleration in May was due to larger increases than in April for food and some other commodities.

The food index rose 1.0 percent in May, following an increase of 0.6 percent in April and declines in the first 3 months of this year. In May, beef prices rose sharply, the first increase this year, and increases for pork and poultry were considerably larger than in April. Prices of cereal and bakery products moved up for the first time in 4 months.

Coffee prices, rising since mid-1975, continued to advance. Fresh fruit and vegetable prices, however, declined after rising in April.

The index for commodities other than food rose 0.6 percent in May compared with an average monthly increase of about 0.3 percent in the previous 8 months. The faster rise in May reflected an increase in gasoline prices for the first time since last October, and larger increases than in recent months for apparel, fuel oil, houses, and new cars. Although the index for used cars advanced sharply for the fourth consecutive month, the May increase of 1.9 percent after seasonal adjustment was smaller than in any of the preceding 3 months. Price increases were also smaller than in recent months for household durables and tobacco products.

The rise in the services index of 0.4 percent in May was about the same as in April and much smaller than earlier this year. However, the source of the April and May

increases differed. Among household services, the index for mortgage interest rates declined in May - the first seasonally adjusted decline since last October. Charges for housekeeping services rose less than in recent months. In contrast, gas and electricity rates, which showed a small rise in April, increased 1.1 percent in May. Among other services, the rise in hospital service charges continued to moderate in May as did charges for apparel-related services, but charges for transportation services showed a somewhat larger increase in May than in April.

## Monthly change in detail (not seasonally adjusted)

Food. The index for food purchased in grocery storeswhich usually declines sharply in May-increased 0.3 percent. The increase was due primarily to higher prices for meats, fish, coffee, and cereal and bakery products. Prices declined for most other foods, including fruits and vegetables, poultry, eggs, dairy products, and sugar.

After declining in the preceding 3 months, beef prices rose 3.8 percent in May. The upturn followed a rise of over 14 percent in wholesale beef prices in April due primarily to reductions in cattle marketings. In May, however, wholesale beef prices declined again-by 5.5 percent-as retailers' demand slowed while cattle slaughter and beef production increased. Pork prices at retail rose 1.0 percent in May--the first increase since last October; at wholesale, pork prices rose slightly in April and sharply in May. The increases reflected smaller supplies and good packer demand as fewer hogs were marketed because of spring field work.

Prices for shrimp, canned tuna, and fresh and frozen fish continued to move up as supplies remained tight due to firm demand, lower domestic landings and imports, and heavy withdrawal from inventories. The rise in tinplate and other production costs also contributed to higher prices.

The rise in prices for cereal and bakery products-the first increase this year-stemmed in part from higher ingredient costs. Wholesale flour prices rose during the first quarter along with wheat prices as adverse weather conditions caused uncertainty about the size of this year's winter wheat crop. In April and May, however, both wheat and wholesale flour prices declined due to improved weather in wheat-producing areas and predictions of a record spring wheat crop. In addition, export demand continued slow as increased foreign competition cut into potential U.S. exports.

The uptrend in coffee prices-which began in mid-1975--has accelerated in recent months, with increases of 4.9 percent in April and 4.8 percent in May. In May, retail coffee prices were 35 percent higher than in May 1975, while wholesale prices for roasted coffee have risen over 54 percent and green coffee, about 68 percent.

Poultry and egg prices declined less than is usual for May; although there were large supplies in the distributive channels, the demand was strong. Prices for fresh fruits and vegetables declined, instead of moving up seasonally, as supplies increased from Mexico and from domestic spring
crops. Prices fell sharply for cucumbers, peppers, tomatoes, and strawberries. Among dairy products, milk prices declined but butter and cheese prices increased. Sugar prices declined again in May after a small increase in April. The trend in sugar prices has been downward since late 1974 because of ample supplies; recently, however, wholesale sugar prices have fluctuated from month to month in reaction to withholding actions by major producing nations and to varying estimates of beet sugar production.

The index for food away from home--restaurant meals and snacks-increased 0.5 percent in May, the same as in recent months.

Commodities other than food. The index for commodities other than food rose 0.8 percent in May before seasonal adjustment. About two-thirds of the rise was due to increases in prices for used cars, gasoline, and apparel. In addition, there were large increases for houses, and home maintenance and repair commodities.

Prices of apparel commodities increased 0.8 percent, a sharper rise than in recent months, and larger than usual for May. There were large increases particularly for cotton items such as men's work trousers and shirts, boys' dungarees, and women's dresses and skirts. Earlier increases in manufacturers' prices for these items reflected sharply higher prices for raw cotton during the past year.

Gasoline prices rose 1.5 percent in May -the first rise in 7 months-as distributors and dealers passed along increased costs to consumers. (Since gasoline is still under price controls, all price increases must be cost-justified.) Despite higher prices, oil companies expect to maintain gallonage; increased gasoline consumption in recent months has reduced refinery stocks even though production has increased.

Used car prices continued to advance at a rapid rate as the demand for larger cars remained strong. The demand for new cars has also been strong this year-domestic new car sales in the first 5 months of this year were up 37.6 percent from the same period last year. Consequently, the new car index held relatively stable in May for the fifth consecutive month instead of declining seasonally as is usual during this period.

Prices for most other nonfood commodities such as furniture, appliances, housekeeping supplies, and toilet goods rose moderately, while prices for floor coverings, textile housefurnishings, and fuel oil declined. The decline of 0.2 percent for fuel oil, however, was smaller than is usual for May.

Services. The services index increased 0.4 percent in May before seasonal adjustment. Indexes for rent and household services other than rent increased 0.4 percent, medical care services rose 0.6 percent, and transportation services 0.3 percent. Among household services, charges for natural gas and electricity increased considerably more than in April. However, charges for domestic and laundry services were
unchanged in May following sharp increases in recent months, and mortgage interest costs declined reflecting lower interest rates on conventional and FHA loans. Among medical care services, physicians' fees rose 0.6 percent, about the same as in April, while the increase of 0.3 percent in charges for hospital services was noticeably smaller than increases earlier this year. In the transportation services
category, auto insurance rose 0.6 percent and auto repairs 0.5 percent, both about the same as in April, but public transportation charges were unchanged. Among other services, charges for drycleaning and laundering men's shirts showed little change, but charges for barber and beauty shop services increased somewhat more than in April.

## (Consumer pries index for urban wape aernerr and cloricen workess, January 1976*100)

Table 10. CPI-gasoline average prices, U.S. city average and selected areas

$\begin{array}{lll}\text { : Area coverege includes the urban portion of the corremponding Standard Metropolitan Statistical } & \text { are used } \\ \text { res (SMSA) uxcept for Neww York and Chicago where the more extensive Standard Consolidated Areas } & \mathbf{1 9 6 0}\end{array}$

The Consumer Price Index (CPI) measures average changes in prices of goods and services usually bought by urban wage earners and clerical workers. It is based on prices of about 400 items which were selected to represent the movement of prices of all goods and services purchased by wage earners and clerical workers. Prices for these items are obtained in urban portions of 39 major statistical areas and 17 smaller cities, which were chosen to represent all urban places in the United States. They are collected from about 18,000 establishmentsgrocery and department stores, hospitals, filling stations, and other types of stores and service establishments.

Prices of food, fuels, and a few other items are obtained every month in all 56 locations. Prices of most other commedities and services are collected every month in the five largest areas and every 3 months in other areas. Prices of most goods and services are obtained by
personal visits of the Bureau's trained representatives. Mail questionnaires are used to obtain local transit fares, public utility rates, newspaper prices, fuel prices, and certain other items.

In calculating the index, price changes for the various items in each location are averaged together with weights which represent their importance in the spending of all wage earners and clerical workers. Local data are then combined to obtain a U.S. city average. Separate indexes are also published for 23 areas.

The index measures price changes from a designated reference date-1967-which equals 100.0. An increase of 22 percent, for example, is shown as 122.0. This change can also be expressed in dollars as follows: The price of a base period "market basket" of goods and services bought by urban wage earners and clerical workers has risen from $\$ 10$ in 1967 to $\$ 12.20$.

## A Note About Calculating Index Changes

Movements of the indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period while percent changes are not. The example in the accompanying box illustrates the computation of index point and percent changes.

Seasonally adjusted percent changes in the U.S. All Items Index are based on seasonal adjustment factors and seasonally adjusted indexes carried to two decimal places. This procedure helps to eliminate rounding error in the percent changes.

Percent changes for 3 -month and 6 -month periods are expressed as annual rates and are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12 -month
period. BLS does not publish annual rates based on data for 1 month.

## A Note on Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted changes are usually preferred, since they eliminate the effect of changes that normally occur at the same time and in about the same magnitude every year-such as price movements resulting from changing
climatic conditions, production cycles, model changeovers, holidays, and sales.

The unadjusted data are of primary interest to consumers concerned about the prices they actually pay. Unadjusted data are also used extensively for escalation purposes. Many collective bargaining contract agreements and pension plans, for example, tie compensation changes to the Consumer Price Index unadjusted for seasonal variation.

## Reliability of Percent Changes in the CPI

A system of "replicated" samples introduced into the index structure in the 1964 revision permits an estimate of sampling error for the CPI. ${ }^{1}$ The table below shows standard errors for monthly, quarterly, and annual percent

Average standard errors of percent changes in the CPI based on 1975 data

| Component | Standard error |  |  |
| :---: | :---: | :---: | :---: |
|  | Monthly change | Quarterly change | Annual change |
| All items | . 04 | . 06 | . 13 |
| Food at home | . 10 | . 17 | . 38 |
| Food away from home | . 11 | . 22 | . 36 |
| Housing | . 08 | . 12 | . 26 |
| Apparel and upkeep | . 16 | . 22 | . 28 |
| Transportation | . 07 | . 11 | . 13 |
| Medical care. | . 13 | . 17 | . 36 |
| Personal care | . 14 | . 22 | . 46 |
| Reading and recreation | . 11 | . 16 | . 37 |
| Other goods and services | . 08 | . 11 | . 22 |

changes in the CPI for all items and for nine commodity groupings based on 1974 averages. The figures may be interpreted as follows: The changes are about 95 out of 100 that the percent change in the CPI as computed differs from the corresponding "complete coverage" change by less than twice the standard error.

Because the CPI is rounded to one decimal place, some ambiguity may arise in interpreting small index changes. As the table indicates, for example, a month-to-month change of 0.1 percent in the all-items CPI is significant. Because of rounding, however, a change of this size in the published index might result from a much smaller change in the unrounded value. Hence, any particular change of 0.1 percent may or may not be significant. On the other hand, a published change of 0.2 percent for a 1 -month period is almost always significant.

This replaces the table of average errors based on 1974 data which was included in the CPI report through December 1975.
