## Price Movements

July 1975

The Consumer Price Index rose 1.1 percent in July. Price increases for meats, poultry, fresh fruits and vegetables, gasoline, and used cars accounted for about three-fourths of the July increase. The July CPI was 162.3 ( $1967=100$ ), 9.7 percent higher than a year ago.

On a seasonally adjusted basis, the CPI increased 1.2 percent in July. The July increase compares with a rise of 0.8 percent in June and an average monthly increase of about 0.5 percent in the first 5 months of this year. The food index rose 1.7 percent after seasonal adjustment, slightly more than in June. The index for commodities other than food increased 0.9 percent, compared with 0.5 percent in June. The increase in the services index of 0.5 percent in July was slightly smaller than in June. (See table A.)

## Monthly changes in detail

Food. The index for food purchased in grocery storesthe major portion of the food index-rose 2.9 percent in July, considerably more than the usual seasonal rise for this month of the year. About a third of this increase stemmed from a contraseasonal increase in fresh vegetable prices. Poultry, pork, and beef prices also rose much more than they usually do in July. Prices for fresh fruits, eggs, fish, and dairy products also rose in July. Prices declined for all other categories of food.

Fresh vegetable prices rose 16.7 percent in July, following an increase of 10.3 percent in June. In both months, potato prices rose sharply as a result of a 13 percent decrease in the size of the crop this summer com-

1 Not seasonally adjusted; data contain little or no seasonal movements.
pared to last year. Acreage was reduced because of poor price prospects last winter when planting decisions were being made. In addition, yields were down in some areas because of insufficient moisture. Onion and tomato prices continued to move up because of reduced output of spring and early summer crops and because supplies from local producing areas scattered across the country were not yet available. Fresh fruit prices continued to increase due to seasonal declines in supplies of citrus fruits and smaller supplies of apples in storage.

The rise in beef prices--which was somewhat smaller in July than in May or June-reflected earlier increases at the wholesale level. Prices at wholesale started to rise in March and advanced 40.8 percent through June. Retail beef prices rose more than 20 percent in the April-July period. Prices rose in response to shortages of Choice beef, which caused price spreads of as much as $\$ 10$ per cwt. between Good and Choice grades in the carlot dressed meat trade. However, as consumers began to resist high beef prices at retail, packers' demand slowed and wholesale prices for beef and cattle turned down in July. Retail and wholesale pork prices, however, continued to rise at a rapid rate in July as hog slaughter and pork production declined. Live hog supplies remained short of supplying the demand from packer buyers, and the short supply of pork moving into retail channels was still finding buyers at high prices. Pork prices at wholesale moved up over 30 percent in the March-July period and retail prices rose more than 20 percent from April to July. Because of the drop in meat production in recent months, and increased demand for poultry, poultry prices--at retail and whole-sale-have also been advancing rapidly since April and increases accelerated sharply in July.

After declining from February through June, prices of dairy products increased in July. Cheese and evaporated milk prices rose as a result of strong demand and higher prices at the wholesale level. At wholesale, price increases for processed dairy products have been accelerating since April because the cost of milk for manufacturing use has been rising due to increased demand and a seasonal decline in milk production. Egg prices also increased in July-after declining in the 2 preceding months-as production in June was down 3.5 percent from the May level.

Prices declined for many types of food purchased in grocery stores in July. Sugar prices continued to decline sharply at the retail level, reflecting earlier declines in wholesale prices. Prices at the wholesale level, however, turned up in July because some major cane producing countries withheld supplies and some refiners started to replenish their inventories.

Cereal and bakery products prices declined for the fourth consecutive month at the retail level. Flour prices fell sharply in response to lower wholesale prices for family flour (flour for home use) brought about by earlier declines in wheat prices. Retail prices of bakery products also declined, but not as much as in recent months. At the wholesale level, the index for cereal and bakery products increased in July, after declining sharply in the preceding 4 months. The increase was primarily due to higher prices for all types of flour other than family flour.

Prices of fats and oil products declined at both retail and wholesale primarily as a result of increased use of cheaper imported vegetable oil-mainly palm oil-in the manufacture of shortening and margarine in place of higher priced soybean and cottonseed oils.

The index for food away from home-restaurant meals and snacks-rose 0.6 percent, more than in May and June.

Commodities other than food. The index for commodities other than food rose 0.7 percent in July. Almost three-fifths of this increase was due to higher prices for gasoline and fuel oil. Gasoline prices (regular and premium grades combined) rose 4.3 percent in July for a rise of 10.5 percent since March, when increases started accelerating. Fuel oil prices-which usually decline in July-rose 1.6 percent, considerably more than in recent months.

The Federal Energy Administration (FEA) allows refiners to make one price change per month to reflect changing production costs. Most oil companies used their price option very early in July and retail gasoline prices jumped sharply just before the July 4th holiday. The refiners continued to attribute their increases to higher costs for crude oil and labor. The $\$ 2$ per barrel excise tax on foreign crude oil, the FEA's "entitlements" program, and the regulated price of "old" domestic crude oil (held at $\$ 5.25$ per barrel, while world market prices have moved up to about $\$ 13$ per barrel) have caused refiners to take action to preserve margins.

Not all of the refinery price hikes have been passed on to consumers. A few gas stations are still under "payback" programs to refund money overcharged during past pricing periods. More important, many gasoline station operators have been unable to increase the pump price by the full amount of the rise in their wholesale costs because of competitive pressures. Although the demand for gasoline is still quite strong as many families are traveling during vacations, more consumers are apparently becoming cost conscious. Major brand name oil companies report declines in sales levels-while inde-
pendents (who may have lower gas prices) report stronger demand.

Among commodities other than food and fuels, prices of used cars continued to advance rapidly in July because of strong demand. Prices of most household durables also rose in July. Floor covering prices rose primarily due to a large increase in vinyl tile prices which, in turn, are still being affected by earlier price rises for petrochemical materials. Appliance prices were higher, reflecting a slight pickup in sales volume after a very slow spring and early summer. The demand for air conditioners was strong because of hot weather, and, since inventories were at less-than-normal levels, dealers were able to pass on recent wholesale price increases. For the most part, however, the improvement in appliance sales has been in the replacement market as housing starts have remained sluggish. Television prices rose in July. Although there were end-of-model-year clearance promotions on 1975 models, the 1976 models with higher prices began appearing on showroom floors. Because of lower prices on the 1975 models and the industry switch to the 90 -day (instead of 1 full year) warranty on 1976 models, the demand has been better for the ' 75 's than for the ' 76 's. The "clearance" sales, therefore, were on selected models only and did not represent drastic price reductions. Among nondurable goods, prices were higher in July for toilet goods, housekeeping supplies, reading materials, drugs and prescriptions, and cigarettes. Higher taxes accounted for much of the rise in cigarette prices.

Competitive pressures and efforts to improve sales accounted for price declines for some consumer goods. New car prices were lower because of larger concessions given by dealers and continuation by one company of rebates to customers. Bargain and promotional prices were used to bolster the depressed demand conditions in the furniture industry. Prices of textile housefurnish-
ings were lower because of white sales. Apparel prices also declined, but not as much as they usually do in July. Lower prices due to summer clearance sales were partially offset by higher prices for fall items which began to appear in stores in some areas.
Services. The services index rose 0.5 percent in July. Almost one-third of this rise was due to an increase of 1.1 percent in charges for medical care. Hospital service charges rose 1.6 percent, considerably more than increases during the spring. Semiprivate room rates rose 2.7 percent and operating room rates 1.4 percent. Fees for doctors, dentists, and other professional services rose 0.6 percent, about the same rate as in recent months. For many hospitals, the fiscal year begins in July, at which time fee schedules are reviewed. Introduction of higher fee schedules this July has been attributed in part to the rise in malpractice insurance premiums and other overhead costs.

The index for household services excluding rent rose 0.5 percent in July, half as much as in June. Charges for electricity rose sharply, and home maintenance and repair services continued to increase. Natural gas charges and mortgage interest rates declined, however. Mortgage interest rates have declined steadily since late 1974, except for an increase in June. The rent index rose 0.3 percent, about the same rate as in recent months.

The transportation services index rose 0.5 percent in July, the same as the June rise. Local transit fareswhich had declined slowly in 1974 and in the first half of this year-rose 0.9 percent in July. Parking fees rose after declining in the 2 preceding months. Most of the increase was in municipal parking fees. Charges for auto insurance and auto repairs continued to rise.

Charges for other services-including personal care, apparel, and recreational services-rose 0.4 percent, about the same as increases in recent months.

${ }^{1}$ Area coverage includes the urban portion of the corresponding Standard Metropolitan Statistical Area (SMSA) except for New York and Chicago which have more extensive Standard Consolidated Areas. Area definitions were established for the 1960 Census and exclude revisions made since 1960.
${ }^{2}$ Foods, fuels, and several other items priced every month in all cities; most other goods and services priced as indicated:

M - Every month.
1 - January, Apriil, July, and October.
2 - February, May, August, and November.

3-March, June September, and December.
3. November $1963=100$

4 February $1965=100$
s December $1963=100$.
NOTE: Price changes within areas are found in the Consumet Prica Index; difterences in living costs among areas are found in family budgets.

${ }^{1}$ Area coverage includes the urban portion of the corresponding Standard Matropolitan Statistical
Area (SMSA) except for New York and Chicago where the more extensive Standard Consolidated Areas
are used. Area definitions are those established for the 1960 Census and do not include revisions made since 1960.

Table 10. Consumer Price Index-Regular and premium gasoline prices, selected areas and U.S. city averages for urban wage earners and clerical workers

The Consumer Price Index (CPI) measures average changes in prices of goods and services usually bought by urban wage earners and clerical workers. It is based on prices of about 400 items which were selected to represent the movement of prices of all goods and services purchased by wage earners and clerical workers. Prices for these items are obtained in urban portions of 39 major statistical areas and 17 smaller cities, which were chosen to represent all urban places in the United States. They are collected from about 18,000 establishmentsgrocery and depart ment stores, hospitals, filling stations, and other types of stores and service establishments.

Prices of foods, fuels, and a few other items are obtained every month in all 56 locations. Prices of most other commodities and services are collected every month in the five largest areas and every 3 months in other areas. Prices of most goods and services are obtained by
personal visits of the Bureau's trained representatives. Mail questionnaires are used to obtain local transit fares, public utility rates, newspaper prices, fuel prices, and certain other items.

In calculating the index, price changes for the various items in each location are averaged together with weights which represent their importance in the spending of all wage earners and clerical workers. Local data are then combined to obtain a U.S. city average. Separate indexes are also published for 23 areas.

The index measures price changes from a designated reference date-1967-which equals 100.0. An increase of 22 percent, for example, is shown as 122.0. This change can also be expressed in dollars as follows: The price of a base period "market basket" of goods and services bought by urban wage earners and clerical workers has risen from $\$ 10$ in 1967 to $\$ 12.20$.

## A Note About Calculating Index Changes

Movements of the indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period while percent changes are not. The example in the accompanying box illustrates the computation of index point and percent changes.

Seasonally adjusted percent changes in the U.S. All Items Index are based on seasonal adjustment factors and seasonally adjusted indexes carried to two decimal places. This procedure helps to eliminate rounding error in the percent changes.

Percent changes for 3 -month and 6 -month periods are expressed as annual rates and are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12 -month
period. BLS does not publish annual rates based on data for 1 month.

| $\quad$ Index Point Change |  |
| :--- | :--- |
| CPI |  |
| Less previous index | 123.8 |
| Equals index point change: | $\frac{123.2}{0.6}$ |
| Percent Change |  |
|  |  |
| Index point difference, | $\underline{0.6}$ |
| Divided by the previous index, | 123.2 |
| Equals, | 0.005 |
| Results multiplied by one hundred | $0.005 \times 100$ |
| Equals percent change: | 0.5 |

## A Note on Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted changes are usually preferred, since they eliminate the effect of changes that normally occur at the same time and in about the same magnitude every year-such as price movements resulting from changing
climatic conditions, production cycles, model changeovers, holidays, and sales.

The unadjusted data are of primary interest to consumers concerned about the prices they actually pay. Unadjusted data are also used extensively for escalation purposes. Many collective bargaining contract agreements and pension plans, for example, tie compensation changes to the Consumer Price Index unadjusted for seasonal variation.

## Reliability of Percent Changes in the CPI

A system of "replicated" samples introduced into the index structure in the 1964 revision permits an estimate of sampling error for the CPI. ${ }^{1}$ The table below shows standard errors for montly, quarterly, and annual

Average standard errors of percent changes in the CPI based on 1974 data

| Component | Standard error |  |  |
| :---: | :---: | :---: | :---: |
|  | Monthly change | Quarterly change | Annual change |
| All items | . 05 | . 07 | . 12 |
| Food at home | . 10 | . 19 | . 40 |
| Food away from home $\qquad$ | . 13 | . 23 | . 42 |
| Housing | . 09 | . 15 | . 23 |
| Apparel and upkeep | . 21 | . 28 | . 33 |
| Transportation | . 07 | . 10 | . 20 |

| Personal care | . 19 | . 24 | . 34 |
| Reading and recreation | . 16 | . 21 | . 27 |
| Other goods and services $\qquad$ | . 13 | . 18 | . 28 |

percent changes in the CPI for all items and for nine commodity groupings based on 1974 averages. The figures may be interpreted as follows: The chances are about 95 out of 100 that the percent change in the CPI as computed differs from the corresponding "complete coverage" change by less than twice the standard error.

Because the CPI is rounded to one decimal place, some ambiguity may arise in interpreting small index changes. As the table indicates, for example, a month-to-month change of 0.1 percent in the all-items CPI is significant. Because of rounding, however, a change of this size in the published index might result from a much smaller change in the unrounded value. Hence, any particular change of 0.1 percent may or may not be significant. On the other hand, a published change of 0.2 percent for a one-month period is almost always significant.

This replaces the table of average errors based on 1973 data which was included in the CPI report through January 1975.

1 The method of deriving these estimates is described in a paper by Marvin Wilkerson, "Measurement of Sampling Error in the Consumer Price Index," Journal of the American Statistical Association, September 1967.

## Reliability of Percent Changes in the CPI
