OFFICE OF PRICES AND LIVING CONDITIONS W. John Layng, Assistant Commissioner

The CPI Detailed Report is a monthly report on consumer price movements including statistical tables and technical notes.

This publication may be ordered from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Price: \$11.55 for yearly subscription, \$1 for single copies and an additional \$2.90 for foreign subscriptions.

January 1975

Price Movements September 1974

The Consumer Price Index rose 1.1 percent in September to 151.9 percent of its 1967 base. The rise was due to higher prices for a wide range of consumer goods and services, notably meats, apparel commodities, and mortgage interest costs. Prices declined for a few items, particularly fresh fruits and vegetables and gasoline. The September CPI was 12.1 percent higher than a year ago.

On a seasonally-adjusted basis, the rise in the September CPI of 1.2 percent was about the same as in August. The food index rose more in September than in August after seasonal adjustment—1.9 percent compared with 1.4 percent, while the index for nonfood commodities increased less—1.0 percent in September compared with 1.5 percent in August. The services index rose 1.1 percent in September, the same as in the preceding month.

Prices in the third quarter

For the calendar quarter ended in September, the CPI increased at a seasonally-adjusted annual rate of 14.2 percent. This was up from the 10.9 percent annual rate in the second quarter and the same as the first quarter's pace. Food prices, which rose at a 3.1 percent annual rate in the second quarter, increased at a 12.3 percent annual rate in the second quarter, increased at a 12.3 percent annual rate in the third quarter as prices of meats, poultry, and eggs rose following declines in the second quarter. The nonfood commodities index rose at an annual rate of 16.5 percent in the 3 months ended in September for the third consecutive quarter in which the increase has been at about this rate. Although gasoline prices declined and price rises for fuel oil and used cars moderated, prices for a wide range of other nonfood

(Seasonally adjusted, except services, compound annual rate)

commodities increased at a faster pace in the third quarter than in the second. The services index rose at a 13.9 percent annual rate in the calendar quarter ended in September to continue an acceleration evident since the beginning of the year.

Food

Prices of food purchased in grocery stores—which constitutes a major portion of the food component of the CPI—rose at a seasonally adjusted annual rate of 12.0 percent in the 3 months ended in September, after leveling out in the preceding quarter. The acceleration in retail food prices followed the turnaround in prices of farm products and foods at the wholesale level. (See table B.)

Wholesale prices for farm products, which had declined almost steadily in the first 6 months of this year, rose sharply in July and August before declining again in September. Adverse weather conditions in grain-producing states and the curtailed marketings of livestock spurred price rises. Higher prices for farm products caused an upturn in wholesale prices of meats, poultry, eggs, cereal and bakery products, and dairy products—all of which had declined in the second quarter. Prices for farm products and foods again declined in September due to unsettled market conditions, sharply expanded livestock slaughter, and sluggish demand at all levels.

In response to higher prices at wholesale levels, retail prices for meats, poultry, and eggs rose in August and September after a steady downtrend from February through July. In addition, price rises for fats and oil products—margarine, and cooking and salad oils accelerated. The higher wholesale prices for refined vegetable oils, in turn, reflect the diminished crop prospects for soybeans this year.

Among other categories of food purchased in grocery stores, prices for sugar and sugar-based products continued to rise at a rapid pace during the 3 months ended in September. Prices for cereal and bakery prod-

Digitized for FRASER http://fraser.stlouisfed.org/ Federal Reserve Bank of St. Louis ucts, partially prepared foods, and processed fruits and vegetables also continued to increase but at a more moderate pace than in the second quarter. Fresh fruit and vegetable prices declined sharply as a result of large supplies from summer and early fall crops. Prices of dairy products also declined. Grocery milk and skim milk prices declined because of ample supplies of fluid milk for bottling. Supplies of milk for manufacturing tightened late in the quarter and caused an upturn in prices of processed dairy products such as cheese, butter, and evaporated milk.

In the calendar quarter ending in September, the index for food away from home---restaurant meals and snacks---rose at a seasonally adjusted annual rate of 10.5 percent or slightly less than in the preceding quarter.

Commodities less food

Prices of most nonfood commodities at the retail level rose at a faster rate in the third quarter than in the second quarter reflecting earlier increases at the wholesale level and rising operating costs. Declining sales volume has had little visible impact thus far on prices at the retail level. There is evidence of retailers increasingly trimming product lines to offer only the most profitable items and reducing inventories because of high interest charges on unsold merchandise. Although retailers have cut back their orders, manufacturers' prices for most consumer goods continued to increase at a rapid rate in the third quarter. However, some signs indicated an easing of the upward pressure on materials prices at the end of third quarter.

Wholesale prices for industrial materials and components at the intermediate stages of processing, which are used to produce finished goods, rose at a seasonally adjusted annual rate of 32.2 percent in the third quarter. Although this rate is substantial, it is smaller than the peak rate of 43.7 percent recorded in the second quarter. Prices for petroleum-related products—chemicals and plastic materials—and paper products continued to rise rapidly. However, prices for textile products, copper, and lumber, which declined in the second quarter, continued to move down in the third quarter. In addition, price increases were smaller for most other materials and components, including steel mill products. Higher prices for metals and metal products have contributed greatly to the rise in prices of durable goods.

The CPI for durable commodities rose at a seasonally adjusted annual rate of 20.8 percent in the 3 months ended in September, slightly faster than in the 3 months ending in June. Prices for recreational goods, such as bicycles and tricycles, and furniture continued to rise at a rapid rate, and price increases accelerated for appliances and floor coverings. A fiber shortage due to insufficient petrochemical capacity has contributed to the rise in prices of floor coverings.

The new car index, which usually declines substantially at the end of the model year, rose during the third quarter. Thus, on a seasonally adjusted basis, this index increased at an annual rate of 19.8 percent, slightly more than in the second quarter. Higher prices for new cars at the retail level resulted from increases in manufacturers' prices and strong demand for 1974 models created by the higher prices on 1975 models. Used car prices rose at a much slower pace in the third quarter than in the second quarter; however, the increase was still substantial due to strong demand and scarcity of good used cars.

The CPI for nondurable commodities increased at a seasonally adjusted annual rate of 11.8 percent in the 3 months ended in September, somewhat slower than in the preceding 3-month period. Excluding fuels (gasoline, motor oil, fuel oil, and coal), prices of nondurable commodities increased at a 15.7 percent annual rate, faster than in either of the preceding two quarters. Price increases accelerated for apparel commodities, housekeeping supplies, alcoholic beverages, and drugs and prescriptions. Prices of other nondurables such as textile housefurnishings, toilet goods, reading materials, and tobacco products continued to increase at a rapid rate.

In the 3 months ended in September, the fuel oil and coal index increased at a 17.4 percent annual rate, substantially slower than in either the first or second quarter. The index this September was still 66.7 percent higher than in September of last year. Gasoline prices declined in the third quarter as inventories increased.

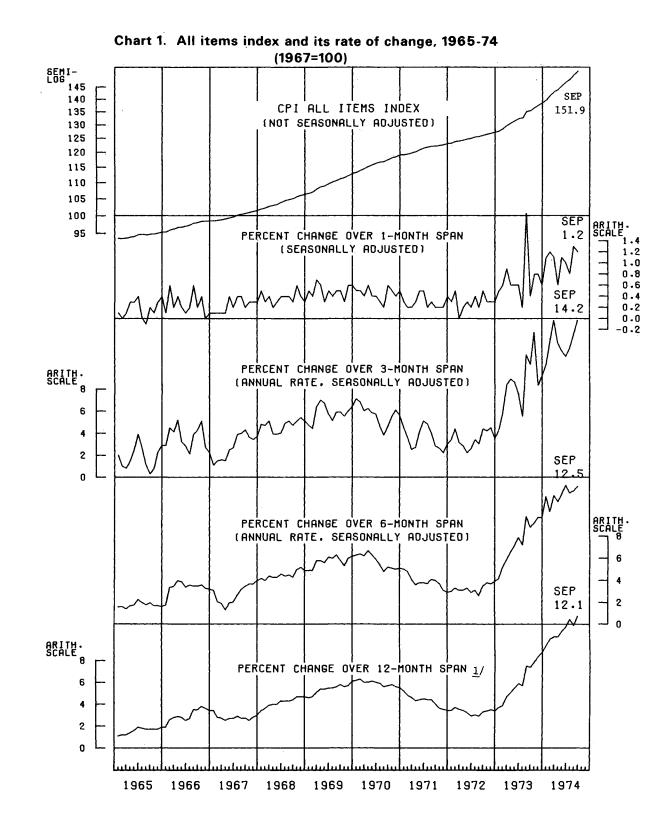

Services

Charges for consumer services in the CPI rose at an annual rate of 13.9 percent in the third quarter to continue the acceleration that began early this year. After price controls were lifted on April 30 and the minimum wage was changed in early May, widespread increases were noted in nearly all categories of services. During the third quarter, most services rose at about the same rate as in the second quarter, except for mortgage interest rate, charges for utilities, and some medical care services.

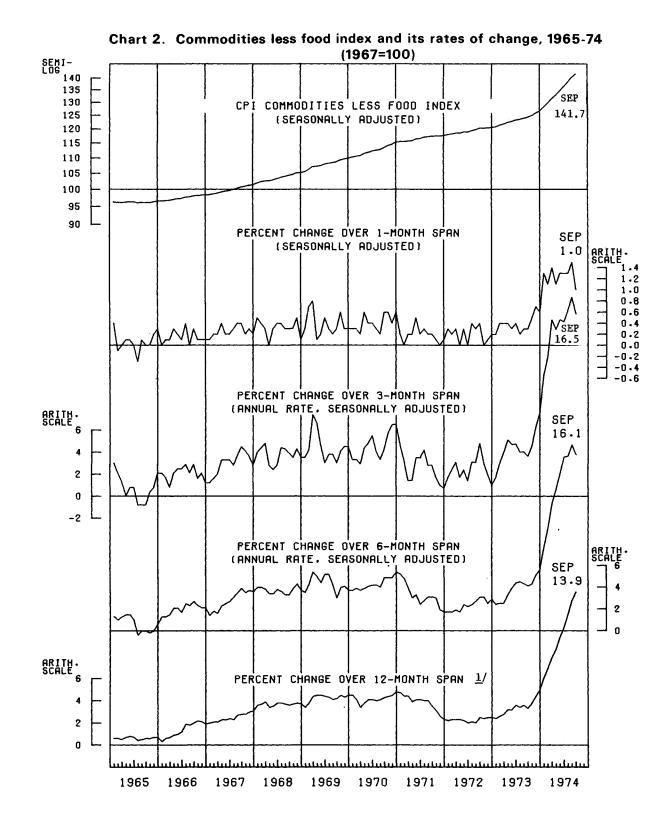

The rise in mortgage interest rates accelerated as a result of continued heavy demand for money, tight money supplies, and outflow of lendable funds from savings institutions. Higher charges for gas and electricity reflected rising fuel costs which utility companies were allowed to pass on to consumers. In addition, many utility companies sought rate increases which would allow them a return adequate for raising money to finance new facilities.

The index for medical care services continued to increase at a rapid rate in the third quarter. In response to increased wages and other operating costs, hospital service charges moved up sharply. Significant increases were also noted for physicians' and dentists' fees and for other professional services such as routine laboratory tests.

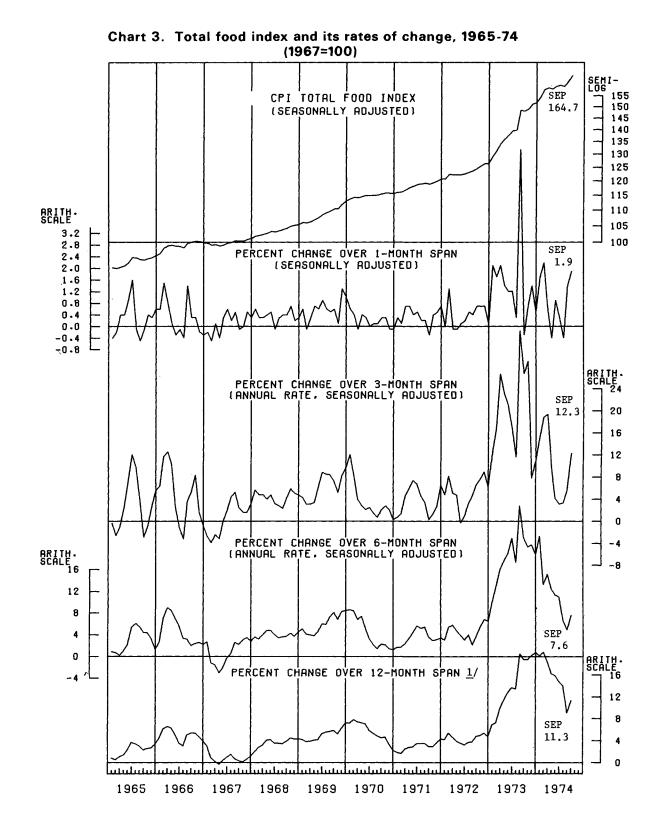

Although charges for other services such as housekeeping and home repair services, barber and beauty shop services, and drycleaning rose at a slower pace in the third quarter, increases remained substantial due to higher prices for materials, and rises in labor and other operating costs.

¹ Area coverage includes the urban portion of the corresponding Standard Metropolitan Statistical Area (SMSA) except for New York and Chicago where the more extensive Standard Consolidated Areas are used. Area definitions are those established for the 1960 Census and do not include revisions made since 1960.
 ² Foods, fuels, and several other items priced every month in all cities; most other goods and services priced as indicated:

 A reary, April, July, and October.
 2 February, May, August, and November.
 3 November 1963=100.
 ⁴ February 1965=100.

NOTE: The Consumer Price Index cannot be used for measuring differences in living costs among areas; it indicates price change within areas. Estimates of differences in living costs among areas are found in the family budgets.

¹ Regional index and relative importance data exclude Anchorage, Alaska and Honolulu, Hawaii which are included in the U.S. level data. Consequently, regional relative importances will not add to U.S. totals.

Brief Explanation of the CPI

The Consumer Price Index (CPI) measures average changes in prices of goods and services usually bought by urban wage earners and clerical workers. It is based on prices of about 400 items which were selected to represent the movement of prices of all goods and services purchased by wage earners and clerical workers. Prices for these items are obtained in urban portions of 39 major statistical areas and 17 smaller cities, which were chosen to represent all urban places in the United States. They are collected from about 18,000 establishments grocery and department stores, hospitals, filling stations, and other types of stores and service establishments.

Prices of foods, fuels, and a few other items are obtained every month in all 56 locations. Prices of most other commodities and services are collected every month in the five largest areas and every 3 months in other areas. Prices of most goods and services are obtained by personal visits of the Bureau's trained representatives. Mail questionnaires are used to obtain local transit fares, public utility rates, newspaper prices, fuel prices, and certain other items.

In calculating the index, price changes for the various items in each location are averaged together with weights which represent their importance in the spending of all wage earners and clerical workers. Local data are then combined to obtain a U.S. city average. Separate indexes are also published for 23 areas.

The index measures price changes from a designated reference date—1967—which equals 100.0. An increase of 22 percent, for example, is shown as 122.0. This change can also be expressed in dollars as follows: The price of a base period "market basket" of goods and services bought by urban wage earners and clerical workers has risen from \$10 in 1967 to \$12.20.

A Note About Calculating Index Changes

Movements of the indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period while percent changes are not. The example in the accompanying box illustrates the computation of index point and percent changes.

Seasonally adjusted percent changes in the U.S. All Items Index are based on seasonal adjustment factors and seasonally adjusted indexes carried to two decimal places. This procedure helps to eliminate rounding error in the percent changes.

Percent changes for 3-month and 6-month periods are expressed as annual rates and are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period. BLS does not publish annual rates based on data for 1 month.

| Index Point Change | |
|-----------------------------------|---------------|
| CPI | 123.8 |
| Less previous index | 1 <u>23.2</u> |
| Equals index point change: | 0.6 |
| Percent Change | |
| Index point difference, | <u>0.6</u> |
| Divided by the previous index, | 123.2 |
| Equals, | 0.005 |
| Results multiplied by one hundred | 0.005×100 |
| Equals percent change: | 0.5 |

A Note on Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted changes are usually preferred, since they eliminate the effect of changes that normally occur at the same time and in about the same magnitude every year—such as price movements resulting from changing climatic conditions, production cycles, model changeovers, holidays, and sales.

The unadjusted data are of primary interest to consumers concerned about the prices they actually pay. Unadjusted data are also used extensively for escalation purposes. Many collective bargaining contract agreements and pension plans, for example, tie compensation changes to the Consumer Price Index unadjusted for seasonal variation. A system of "replicated" samples introduced into the index structure in the 1964 revision permits an estimate of sampling error for the CP1.¹ The table below shows standard errors for monthly, quarterly, and annual *percent changes* in the CPI for all items and for nine commodity groupings based on 1973 averages.

Average standard errors of percent changes in the CPI based on 1973 data

| Component | Standard error | | |
|---------------------|----------------|-----------|--------|
| | Monthly | Quarterly | Annual |
| | change | change | change |
| | | | |
| All items | .04 | .06 | .08 |
| Food at home | .10 | .15 | .17 |
| Food away from | | | |
| home | .14 | .26 | .29 |
| Housing | .06 | .10 | .17 |
| Apparel and upkeep. | .19 | .26 | .29 |
| Transportation | .06 | .10 | .17 |
| Medical care | .08 | .14 | .18 |
| Personal care | .14 | .20 | .39 |
| Reading and | | | |
| recreation | .09 | .14 | .17 |
| Other goods and | | | |
| services | .09 | .11 | .27 |

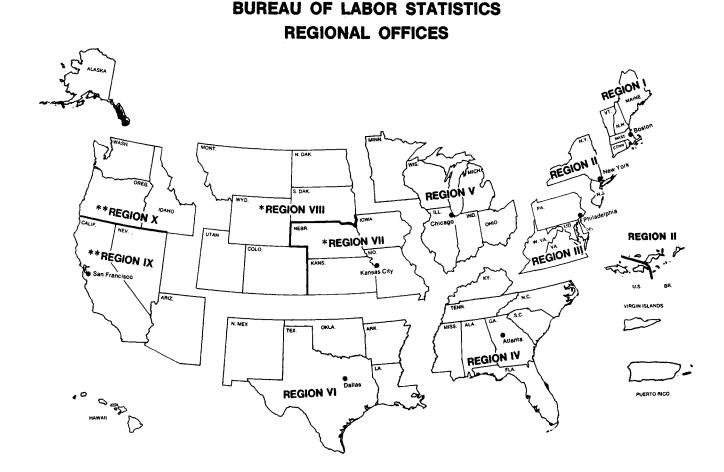

The figures may be interpreted as follows: The chances are about 95 out of 100 that the percent change in the CPI as computed differs from the corresponding "complete coverage" change by less than twice the standard error.

Because the CPI is rounded to one decimal place, some ambiguity may arise in interpreting small index changes. As the table indicates, for example, a monthto-month change of 0.1 percent in the all-items CPI is significant. Because of rounding, however, a change of this size in the published index might result from a much smaller change in the unrounded value. Hence, any particular change of 0.1 percent may or may not be significant. On the other hand, a published change of 0.2 percent is almost always significant, regardless of the time period to which it relates.

This replaces the table of average errors based on 1971 data which was included in the CPI report through January 1974.

¹ The method of deriving these estimates is described in a paper by Marvin Wilkerson, "Measurement of Sampling Error in the Consumer Price Index," Journal of the American Statistical Association, September 1967.
