U.S. DEPARTMENT OF LABOR
Elizabeth Dole, *Secretary*

BUREAU OF LABOR STATISTICS
Janet L. Norwood, *Commissioner*

OFFICE OF PRICES AND LIVING CONDITIONS
Kenneth V. Dalton, *Associate Commissioner*

The *CPI Detailed Report* is a monthly report on consumer price movements, including statistical tables and technical notes. The report covers two indexes, the Consumer Price Index for All Urban Consumers (CPI-U) and the Consumer Price Index for Wage Earners and Clerical Workers (CPI-W). The indexes reflect data for the U.S. city average and selected areas.

A subscription may be ordered for 1 or 2 years from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Subscription price per year $21 domestic, and $26.25 foreign. Single copy domestic, $7; foreign, $8.75. Send correspondence on subscription matters, including address changes and missing issues, to the Superintendent of Documents: telephone (202) 275-3054.

CPI MAILGRAM provides selected U.S. City Average data for CPI-U and CPI-W within 24 hours of release. Order from: National Technical Information Service, 5285 Port Royal Road, Springfield, Virginia 22161. Subscription rates: $145 in contiguous U.S. and Hawaii; $160 in Alaska and Canada.

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission. Second-class postage paid at Washington, DC, and at additional mailing offices.

Price Movements
April 1990

The Consumer Price Index for All Urban Consumers (CPI-U) rose 0.2 percent before seasonal adjustment in April to a level of 128.9 (1982-84=100). For the 12-month period ended in April, the CPI-U increased 4.7 percent.

The Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W) increased 0.2 percent in April prior to seasonal adjustment. The April 1990 CPI-W level of 127.3 was 4.5 percent higher than the index in April 1989.

CPI for All Urban Consumers (CPI-U)

On a seasonally adjusted basis, the CPI-U rose 0.2 percent in April. This rise follows increases of 1.1 percent in January and 0.5 percent in both February and March. While the moderation in April was broad-based, the slowdown was most evident in those components largely responsible for the first quarter rise—food, energy, and apparel. Food prices declined 0.2 percent in April, primarily as a result of a sharp drop in fresh vegetable prices. Energy prices, which increased sharply in January, declined in April for the third consecutive month, as a decrease in the index for household fuels more than offset a small increase in prices for motor fuels. The index for apparel and upkeep rose slightly in April, after advancing sharply in both February and March.

For the first 4 months of 1990, the CPI-U advanced at a 6.8-percent seasonally adjusted annual rate.

The food and beverages index registered its first decrease since July 1987, declining 0.2 percent in April. Grocery store food prices fell 0.7 percent, reflecting declines in the indexes for fruits and vegetables and dairy products. Fresh vegetable prices declined 15.5 percent in April and have dropped 19.8 percent in the past 2 months, partially offsetting the 29.2-percent rise in the first 2 months of the year. In April, prices for fresh fruits rose 0.4 percent and those for processed fruits and vegetables increased 0.8 percent. The index for dairy products—down 1.3 percent in April—declined for the second consecutive month after advancing 10.8 percent in the preceding 6-month period. Partially offsetting the above mentioned declines were increases of 0.9 and 0.8 percent, respectively, in the indexes for cereal and bakery products and meats, poultry, fish, and eggs. In the latter group, beef and pork prices rose 1.1 and 1.5 percent, respectively, while poultry prices declined 2.0 percent. The other two components of the food and beverage index—restaurant meals and alcoholic beverages—increased 0.5 and 0.3 percent, respectively.

The housing index increased 0.1 percent in April, following a 0.5-percent rise in March. Shelter costs, which rose 0.7 percent in March, increased 0.2 percent in April. Within shelter, renters' and homeowners' costs rose 0.1 and 0.3 percent, respectively, while maintenance and repair costs were unchanged. The index for fuel and other utilities declined 0.5 percent as a decrease in fuel prices more than offset a small increase in the index for other utilities and public services. Fuel oil prices—down 0.6 percent in April—have now declined for 3 consecutive months and are at virtually the same level as last December. In April, charges for electricity rose 0.2 percent, while those for natural gas dropped 3.0 percent, their largest decline in nearly 3 years. Among other utilities and public services, the index for garbage and trash

Other goods and services	.6	.3	.9	.7	.7	.6	.5	7.2	7.8

collection recorded its fifth consecutive large increase. On the other hand, charges for cable television, which had risen 6.1 percent in the preceding 4 months, declined 0.2 percent in April. The other major housing group—household furnishings and operations—was unchanged in April for the second month in a row.

Transportation costs rose 0.1 percent in April, following a decrease of the same magnitude in March. A turnaround in gasoline prices—up 0.3 percent in April after declining 1.4 percent in March—was principally responsible for the upturn. Unlike fuel oil prices, gasoline prices have not fallen back to their pre-January level. Following a 7.7-percent advance in January, gasoline prices have declined 0.3 percent in the 3 months ended in April. Automobile purchase costs declined for the third consecutive month. The index for new vehicles declined 0.2 percent, and automobile finance charges dropped 0.7 percent. Used car prices declined for the fifth consecutive month—down 0.6 percent in April. The index for public transportation—up 0.9 percent in April—has advanced 6.5 percent in the first 4 months of 1990, principally due to the increases in airline fares.

The index for apparel and upkeep rose 0.1 percent in April, following sharp increases in the preceding 2 months. Clothing prices were unchanged in April as a decline in prices for women's wear offset price increases for other apparel commodities. The index for apparel services advanced 0.8 percent.

The medical care component rose 0.8 percent in April to a level of 8.9 percent above a year ago. The indexes for medical care commodities—prescription drugs, nonprescription drugs, and medical supplies—and medical care services also increased 0.8 percent. Within medical care services, charges for professional medical services and hospital and related services each advanced 0.7 percent.

Entertainment costs rose 0.4 percent in April, the same as in each of the preceding 2 months. Increases in the indexes for admissions (to movies, theaters, concerts, operas, other musical events, and sporting events) and fees for participant sports—up 1.3 and 1.1 percent, respectively—accounted for over 70 percent of the April entertainment advance.

The 0.4-percent rise in the April index for other goods and services was the smallest monthly increase since November. Almost 40 percent of this increase was accounted for by a 1.0-percent advance in the index for personal care.

CPI for Urban Wage Earners and Clerical Workers (CPI-W)

On a seasonally adjusted basis, the CPI for Urban Wage Earners and Clerical Workers rose 0.1 percent in April.

Improvements in CPI Procedures

The Bureau of Labor Statistics continuously evaluates the Consumer Price Index (CPI) program to identify needed improvements. In the past, however, most improvements in procedures were introduced only at the time of a major revision of the CPI, which occurred about every 10 years when the market basket of goods and services priced was updated.

BLS now is introducing small, though potentially significant improvements as their benefits are demonstrated. This article describes three recent changes in CPI procedures—a change in the imputation (estimating) procedure for some new model year cars and trucks, an improvement in the method used to calculate lodging while out of town, and sample augmentation.

Imputation procedures for new cars and trucks

Effective with the calculation of the CPI for October 1989, BLS improved the methodology used to impute (estimate) price change for some new model year cars and trucks.

The CPI measures the average change in prices paid by consumers for a fixed market basket of goods and services. Because of this, conceptual problems exist in the construction of indexes where varieties of goods and services change or are replaced over time by new varieties. When a new model year car or truck replaces the previous model year in the CPI, the new model is usually of *comparable* quality to the old one, or the quality differences between the two can be identified and factored out. In either case, only the pure, or constant-quality, price change associated with the model year changeover is used in index calculations. However, if the new model is significantly different in quality from the old one and the quality differences cannot be factored out (in this case the two varieties are considered to be *noncomparable),* it is not possible to isolate the pure price change between the two model years. Instead, an estimate of constant-quality price change is made by imputation.

For most goods and services, the price change between the old item and the noncomparable new item is estimated or imputed from the average price change of all similar items used in CPI calculations that month for the same geographic area. For example, before October 1989, the price change for noncomparable model year car changeovers was imputed from the average price change reported for all other cars that month in the same geographic area. However, BLS research established that this imputation method creates a potential bias for new cars and trucks because the average price change for *all* new cars and trucks in a month is not the best approximation of the price change for noncomparable model year changeovers. Rather, our research indicated that the average price change for all comparable model year changeovers was a much better approximation. Therefore, since October 1989, price changes for noncomparable new models have been imputed using only the constant-quality price changes of comparable model changeovers. Price changes for cars and trucks *within* the same model year are no longer used to impute price changes that occur *between* model years.

Prior to implementation, BLS analyzed the effect that this change in index calculation procedures had on index levels. As expected, the value of the new vehicle index under the proposed methodology was slightly higher than that for the published new vehicle index. This occurred because the monthly average price change for comparable model year changeovers was usually higher than the monthly average price change for all automobiles.

For additional information on this change, write to the Bureau of Labor Statistics, Division of Consumer Prices and Price Indexes, Room 3216 BC, Washington, DC 20212, or call Kenneth J. Stewart at (202) 272-5080.

Lodging while out of town

Effective with the calculation of indexes for January 1990, an improvement was made to the methodology used to calculate the index for Lodging While Out of Town. The Lodging While Out of Town Index is published at the U.S. level only and is one component of the Other Renters' Costs Index. The Other Renters' Costs Index is an aggregate index that is published for all market baskets (basic area level) on a monthly basis. It includes the three indexes shown below (with their U.S. relative importance values):

Index	*Relative importance*
Lodging While Out of Town	1.675
Lodging While at School	.206
Tenants' Insurance	.035

At the U.S. level, the index for Lodging While Out of Town makes up approximately 87 percent of the weight of

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

the Other Renters' Cost Index, so it effectively moves this index. Unfortunately, the sample size for Lodging While Out of Town is relatively small.[1] The data used in the sample tend to be for vacation locations that have markedly different in-season and out-of-season prices. The combination of these factors means that at the market basket level, the published index for Other Renters' Costs can be extremely volatile.

Beginning in January 1990, the indexes for Lodging While Out of Town at the market basket level have been calculated by a regional relative/composite estimation process. Relatives of price change are calculated for each of the four CPI regions—Northeast, North Central, South, and West. Then each regional relative is fed back into the index calculation process and used to move the index for Lodging While Out of Town in all the market baskets in a specific region.

The effect of this change is to maximize the representation of the geographic areas in which expenditures for lodging while out of town are made by using each quote in all areas of the region. This method increases the number of quotes used to calculate each market basket index without adding to the considerable expense of collecting data in areas where no other CPI data are collected. It also has the effect of smoothing the Other Renters' Costs Index in each area. It does not, however, change the price movement reflected in the regional indexes or in the U.S. level indexes for Lodging While Out of Town.

For additional information on this change, write to the Bureau of Labor Statistics, Division of Consumer Prices and Price Indexes, Rm 3216, BC, Washington, DC 20212, or call Dan Ginsburg at (202) 272-5177.

[1] In addition, the data in the sample tend to be widely dispersed geographically. The locations are not limited to the 85 CPI pricing areas, but are found throughout the United States. Consequently, the cost of collecting data for the Lodging While Out of Town Index outside standard pricing areas is very high.

Sample augmentation

Effective with the calculation of the Consumer Price Index for May 1990, BLS has implemented a process to increase the number of outlets in which prices are collected. The augmentation of the outlet sample will be done in addition to the regular updating of samples. It will be carried out in some geographic areas and for categories of items which have experienced an unusual rate of attrition. Currently, item and outlet samples are updated each year in one-fifth of the geographic areas. This outlet sample augmentation will be done in the four-fifths of the areas not scheduled for that regular updating in 1990. An analysis of the results of the 1990 augmentation will determine whether this procedure will be used in the future.

The increase in the number of price quotes collected will represent less than 5 percent of the total number of price quotes available for use in the CPI. The additional price quotes are intended to replace those lost over time through attrition. Attrition takes place when outlets go out of business or stop selling the categories of items that are priced for the CPI. When this occurs, a smaller sample of price quotes is left to measure the monthly price change.

The point-of-purchase survey is the source of information on outlets for commodities and services for the CPI. The statistical sampling techniques used to select outlets for the augmentation are identical to those used for the regular outlet sample updating. These procedures are described in *BLS Handbook of Methods,* chapter 19.

While users of the index will not see a change in the index as a result of the outlet sample augmentation, overall index accuracy will be increased due to the larger sample of prices.

For additional information on this procedure write to the Bureau of Labor Statistics, Division of Consumer Prices and Price Indexes, Room 3216 BC, Washington, DC 20212, or call Charles Mason at (202) 272-2604.

Pittsburgh-Beaver Valley, PA	2	-	123.4	-	124.9	4.8	1.2	-	-	-	-

[1] Foods, fuels, and several other items priced every month in all areas; most other goods and services priced as indicated:
M - Every month.
1 - January, March, May, July, September, and November.
2 - February, April, June, August, October, and December.

[2] Regions are defined as the four Census regions.

[3] Indexes on a December 1986=100 base.

- Data not available.

NOTE: Local area CPI indexes are byproducts of the national CPI program. Each local index has a smaller sample size than the national index and is, therefore, subject to substantially more sampling and other measurement error. As a result, local area indexes show greater volatility than the national index, although their long-term trends are similar. Therefore, the Bureau of Labor Statistics strongly urges users to consider adopting the national average CPI for use in their escalator clauses.

[1] Foods, fuels, and several other items priced every month in all areas; most other goods and services priced as indicated:
M - Every month.
1 - January, March, May, July, September, and November.
2 - February, April, June, August, October, and December.

[2] Regions are defined as the four Census regions.

[3] Indexes on a December 1986=100 base.

- Data not available.

NOTE: Local area CPI indexes are byproducts of the national CPI program. Each local index has a smaller sample size than the national index and is, therefore, subject to substantially more sampling and other measurement error. As a result, local area indexes show greater volatility than the national index, although their long-term trends are similar. Therefore, the Bureau of Labor Statistics strongly urges users to consider adopting the national average CPI for use in their escalator clauses.

Technical Notes

Brief Explanation of the CPI

The Consumer Price Index (CPI) is a measure of the average change in prices over time in a fixed market basket of goods and services. The Bureau of Labor Statistics publishes CPI's for two population groups: (1) a CPI for All Urban Consumers (CPI-U) which covers approximately 80 percent of the total population and (2), a CPI for Urban Wage Earners and Clerical Workers (CPI-W) which covers 32 percent of the total population. The CPI-U includes, in addition to wage earners and clerical workers, groups such as professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, and retirees and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, and fuels, transportation fares, charges for doctors' and dentists' services, drugs, and the other goods that people buy for day-to-day living. Prices are collected in 85 urban areas across the country from about 57,000 housing units and approximately 19,000 retail establishments—department stores, supermarkets, hospitals, filling stations, and other types of stores and services establishments. All taxes directly associated with the purchase and use of items are included in the index. Prices of food, fuel, and a few other items are obtained every month in all 85 locations. Prices of most other commodities and services are collected every month in the five largest geographic areas and every other month in other areas. Prices of most goods and services are obtained by personal visits of the Bureau's trained representatives. Some data, such as used car prices, are obtained from secondary sources.

In calculating the index, price changes for the various items in each location are averaged together with weights which represent their importance in the spending of the appropriate population group. Local data are then combined to obtain a U.S. city average. Seperate indexes are also published by size of city, by region of country, for cross-classifications of regions and population-size classes, and for 29 local areas. Area indexes do not measure differences in the level of prices among cities, they only measure the average change in prices for each area since the base period.

The indexes measure price change from a designated reference date, 1982-84, which equals 100.0. An increase of 7 percent, for example, is shown as 107.0. This change can also be expressed in dollars as follows: The price of a base period "market basket" of goods and services in the CPI has risen from $100 in 1982-84 to $107.

For further details, see *BLS Handbook of Methods*, BLS Bulletin 2285, April 1988, and *The Consumer Price Index: 1987 Revision*, BLS Report 736, January 1987.

Calculating Index Changes

Movements of the indexes from one month to another are usually expressed as percent changes rather than changes in index points, because index point changes are effected by the level of the index in relation to its base period while percent changes are not. The example in the accompanying box illustrates the computation of index point and percent changes.

Percent changes for 3-month and 6-month periods are expressed as annual rates and are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Index Point Change	
CPI	112.5
Less previous index	108.5
Equals index point change	4.0
Percent Change	
Index point difference	4.0
Divided by the previous index	108.5
Equals	0.037
Results multiplied by one hundred	0.037 × 100
Equals percent change	3.7

Energy Prices

Price are usually available for the U.S. city average, 28 large urban areas, and 16 areas reflecting the four Census regions cross-classified by four population sizes. However, not all energy commodities and services are used in every area of the country. Fuel oil, for example, is not a common heating fuel in some urban areas, particularly in the South and West. Where no average prices are available, the designation NA will also appear if the data sufficiency criteria have not been met in any given month. For example, if there are fewer than five usable fuel oil prices for a published city or region size class, no fuel oil prices for the area wiil be published.

All prices are collected monthly by BLS representatives in the urban areas priced for the CPI. Prices for natural gas and electricity include fuel and purchased gas adjustments and all applicable taxes. Fuel oil and gasoline prices include applicable Federal, State, and local taxes.

Natural gas and electricity. Natural gas prices are reported in therms, which are a measure of heating value. Electricity prices are given in kilowatt hours (kwh). For both utility services, the consumption ranges specified in table P2 are the upper and lower limits of the bill sizes priced for the Consumer Price Index. The average prices per therm and per kilowatt hour are calculated from bills priced within these ranges. It should be noted that bills priced for the CPI are not only for different consumption amounts, but may also be calculated from different types of residential rate schedules. *The average prices per therm and per kilowatt hour are not, therefore, generally suitable for use in place-to-place price comparisons.*

The average prices for 40 and 100 therms of natural gas for 500 kilowatt hours of electricity (table P1) are calculated from a special price collection program. They are not used in the calculation of the CPI. Since heating and air-conditioning requirements vary by geographic location, climate, and weather conditions, it cannot be inferred that these consumption amounts represent those used by a typical residential consumer. These bills are used merely to track price changes over time for constant amounts of consumption, and to provide continuity with prices of natural gas and electricity formerly published in conjunction with the unrevised Consumer Price Index.

Fuel oil. Only *#2* fuel oil (home heating oil) is priced. Prices are collected, in most cases, for quantities greater than one gallon. These prices are converted to a gallon price for this program. Fuel oil prices reflect discounts for quantity and/or quick payment.

Gasoline. Gasoline prices are collected at the pump from a sample of full service, mini-service, and self-serve gas stations.

Approximate British Thermal Unit (BTU) values for some energy items are as follows, according to the source indicated:

1 therm = 100,000 BTU'S (U.S. Department of Energy).
1 kwh = 3,412 BTU'S (Edison Electric Institute)
1 gallon *#2* fuel oil = 140,000 BTU'S (U.S. Department of Energy).

Food Prices

In the revised CPI, actual weighted average prices are calculated each month at the national level and for the four Census geographic regions. As a result of changes in price collection methodology and sample sizes, average prices for individual cities cannot in general be produced. It is hoped, however, that regional average prices will help satisfy the need for local area data. It should be noted that the average food prices in this report reflect variations in brand, quality, and size among geographic areas. Users of average food prices should be aware that these differences exist.

Because a number of food commoditites are not available in all areas on a year-round basis, prices will not appear in some months for some regions or for the U.S. city average. In other instances, sufficient prices may not be available due to temporary disruptions in supplies. Where no average prices are available, the designation NA will appear. When a price is not available from an individual store in any month, an estimated price will be calculated for the missing item and used in computing the average price. In cases where the proportion of estimated prices used to calculate the average is considered too high, the average price will not be published and NA will appear for that item in the table.

Because of space limitations in the table, the description for each item is abbreviated. More detailed specifications are available from the BLS regional offices or from the Washington office upon request.

Reference Base Change

Beginning with the release of data for January 1988 in February 1988, most Consumer Price Indexes have shifted to a new reference base year. All indexes previously expressed on a base of 1967=100, or any other base through December 1981, have been rebased to 1982-84=100. Only indexes with a base later than December 1981 have maintained their bases. This base change was reviewed by the Office of Federal Statistical Policy and Standards, Office of Management and Budget, and is in keeping with the Government's longstanding policy to update index bases periodically. Selection of the 1982-84 period was made to coincide with the updated expenditure weights, which are based upon data tabulated from the Consumer Expenditure Surveys for 1982, 1983, and 1984. The last rebasing of CPI data occurred in

Digitized for FRASER

Federal Reserve Bank of St. Louis

February 1971, when the 1967 base was substituted for the former 1957-59 base.

Historical data for each CPI series on the new base are available from the Bureau of Labor Statistics. For the convenience of users, the BLS will continue to publish all-items indexes for the U.S. city average, and for the individual local areas for which CPI's are published, on their former official reference base (1967=100 in most cases).

Conversion factors and an accompanying fact sheet on rebasing are available from BLS. Dividing by one of these factors will rebase the related index series from its current 1982-84 base to its previous reference base. *(Users should note:* Because of rounding effects, there may be occasional minor differences between the final rebased index and the result obtained using the conversion factor.)

Adjustment of Shelter Indexes for Aging Effects

Beginning with the January 1988 CPI, the Bureau of Labor Statistics adjusted the monthly CPI shelter indexes for the change in quality resulting from the effect of aging on rental housing. In January 1987, the Bureau announced its intention to begin making such adjustments, assuming that further research substantiated the need to do so. The decision to implement the adjustment was based on extensive BLS research, in which alternative adjustment methods were explored and tested. Evaluation of the research indicates that an aging effect exists, and that the chosen method is operationally feasible.[1] The adjustment affects CPI shelter indexes, which would have been raised by 0.2 percent for the year 1987 had an aging adjustment been applied.

The quality of a housing unit decreases as the unit ages. Existing BLS methods are used to correct for relatively easily measured quality changes such as the addition of an extra bedroom, but such methods are inadequate to correct for deterioration in the condition of housing units.[2] The aging adjustment method was specificially designed to correct for quality changes associated with this deterioration. The BLS used hedonic regression methods to estimate the aging effect. The estimates were then used to correct the CPI rent and rental equivalence indexes. Hedonic regressions are statistical functions that relate the price of a good to its attributes or characteristics. For example, a hedonic regression relates a housing unit's rent to its size, age, location, etc. By using BLS housing survey data from 1987 and Census data from 1980, hedonic regression methods provided estimates of the relationship between a housing unit's rent and age while other housing unit characteristics were held constant. The estimated relationship was then used to construct the aging adjustment. Estimates will be recomputed annually by using the previous year's BLS housing survey data and the most recently available Census data.

[1] A complete technical presentation of BLS research on this subject is available in William C. Randolph, "Housing Depreciation and Aging Bias in the Consumer Price Index," BLS Working Paper No. 166, April 1987, and *Journal of Buisness and Economic Statistics*, Vol. 6, No. 3, July 1988, pp. 359-71 and in William C. Randolph, "Estimation of Housing Depreciation: Short Term Quality Change and Long Term Vintage Effects," BLS Working Paper No. 160, April 1986, and *Journal of Urban Economics*, Vol. 23, March 1988, pp. 162-78. These papers are available from the BLS on request.

[2] For details on existing quality adjustment methods, see, *BLS Handbook of Methods*, chapter 19 (BLS Bulletin 2285).

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted changes are usually preferred since they eliminate the effect of changes that normally occur at the same time and in about the same magnitude every year—such as price movements resulting from changing climatic conditions, production cycles, model changeovers, holidays, and sales.

The unadjusted data are of primary interest to consumers concerned about the prices they actually pay. Unadjusted data are also used extensively for escalation purposes. Many collective bargaining contract agreements and pension plans, for example, tie compensation changes to the Consumer Price Index unadjusted for seasonal variation.

Seasonal factors used in computing the seasonally adjusted indexes are derived by the X-11-ARIMA Seasonal Adjustment Method. The updated seasonal data at the end of 1977 replaced data from 1967 through 1977. Subsequent annual updates have replaced 5 years of seasonal data, e.g., data from 1985 through 1989 were replaced at the end of 1989. The seasonal movement of all items and 45 other aggregations is derived by combining the seasonal movement of 55 selected components. Each year the seasonal status of every series is reevaluated based upon certain statistical criteria. If any of the 55 components change their seasonal adjustment status from seasonally adjusted to not seasonally adjusted, not seasonally adjusted data will be used for the last 5 years,

http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

but the seasonally adjusted indexes will be used before that period.

Effective with the calculation of the seasonal factors for 1990, the Bureau of Labor Statistics has used an enhanced seasonal adjustment procedure called intervention analysis for some CPI series. Intervention analysis allows for better estimates of seasonally adjusted data. Extreme values and/or sharp movements which might distort the seasonal pattern are removed from the data prior to calculation of seasonal factors. For the fuel oil and the motor fuels indexes, this procedure was used to offset the effects that extreme price volatility would otherwise have had on the estimates of seasonally adjusted data for those series. For some women's apparel indexes and the girls'apparel index, the procedure was used to offset the effects of changes in pricing methodology; and for new cars and for new vehicles, this procedure was used to offset the effects of changes in marketing strategies and the introduction of new models. A description of intervention analysis, as well as a list of events treated as interventions and seasonal factors for these items may be obtained by writing the Bureau of Labor Statistics, Division of Consumer Prices and Price Indexes, Washington, DC 20212 or by calling Claire McAnaw on (202)504-2051.
