## STATISTICAL TABLES

Section A-Labor Force, Employment, and Unemployment - Household data

A- 1: Employment status of the noninstitutional population 14 years and over, 1929 to date ..... 23
A- 2: Employment status of the noninstitutional population 14 years and over, by sex, 1940, 1944, and 1947 to date ..... 24
A- 3: Employment status of the noninstitutional population 14 years and over, by sex and color ..... 25
A- 4: Full- and part-time status of the civilian labor force, by age and sex ..... 25
A- 5: Unemployed persons, by age and sex ..... 26
A- 6: Unemployed persons, by industry of last job ..... 26
A- 7: Unemployed persons, by occupation of last job ..... 27
A- 8: Unemployed persons, by marital status and household relationship ..... 27
A- 9: Employment status of persons 16-21 years of age in the noninstitutional population, by color ..... 27
A-10: Unemployed persons, by duration of unemployment ..... 28
A-11: Long-term unemployed by industry and occupation of last job ..... 28
A-12: Long-term unemployed, by sex, age, color, and marital status ..... 29
A-13: Unemployed persons looking for full- or part-time work, by age and sex ..... 29
A-14: Total labor force, by age and sex ..... 30
A-15: Employed persons, by age and sex ..... 30
A-16: Employed persons, by class of worker and occupation ..... 30
A-17: Employed persons, by hours worked
31
31
A-18: Employed persons, by full- or part-time status ..... 31
A-19: Employed persons with a job, but not at work, by reason not working and pay status ..... 31 ..... 32
A-20: Employment status of the noninstitutional population, by age and sex
A-20: Employment status of the noninstitutional population, by age and sex
A-2l: Nonagricultural wage and salary workers, by full- or part-time status, hours of work, and industry ..... 32
A-22: Persons at work in nonfarm occupations by full- or part-time status, hours of work, and occupation ..... 33
A-23: Occupation group of employed persons, by sex and color ..... 33.
A-24: Persons at work in nonagricultural industries; by full-time and part-time status, hours of work, and selected characteristics ..... 34
A-25: Persons at work, by hours of work, and class of worker ..... 34
34
A-26: Summary employment and unemployment estimates, by age and sex, sea sonally adjusted ..... 35
A-27: Seasonally adjusted rates of unemployment ..... 35
A-28: Unemployed persons by duration of unemployment, seasonally adjusted ..... 35
A-29: Rates of unemployment by age and sex, seasonally adjusted ..... 36
A-30: Employed persons by age and sex, seasonally adjusted ..... 36

## CAUTION

Periodically, the Bureau adjusts the industry employment series to a recent benchmark to improve their accuracy. These adjustments may also affect the hours and earnings series because employment levels are used as weighte. All industry statistics shown in this report are adjusted to a March 1965 benchmark. Data from April 1965 forward are subject to revision at the time of the next benchmark adjustment. The user is referred to the technical note in the back of this volume for further details regarding the benchmark adjustments as well as other aspects of the program.

Beginning with September 1966 and subsequent issues of Employment and Earnings and Monthly

Report on the Labor Force, data in tables $B-1$ through $\mathrm{B}-6, \mathrm{C}-1$ through $\mathrm{C}-8$ and $\mathrm{D}-1$ through D-4 are based on March 1965 benchmarks. Therefore issues prior to September 1966 cannot be used in conjunction with national industry data now shown in sections $B, C$, and $D$. Comparable data for priorperiods are published in Employment and Earnings Statistics for the United States, $1909-66_{2}$ BLS Bulletin 1312-4.

When industry data are again adjusted to new benchmarks, another edition of Employment and Earnings Statistics for the United States will be issued containing the revised data extending from April 1965 forward to a current date, as well as the prior historical statistics.

[^0]
# The Employment Situation In 1966 

## By Paul M．Ryscavage＊

The Nation＇s unemployment rate fell from 4.6 percent in 1965 to 3.9 percent in 1966－－the first year it had been below 4.0 percent since the Korean war．${ }^{1}$ Although the annual decrease in the rate of unemployment was approximately the same as in 1964 and 1965，the month－to－month changes during 1966 indicated that the decline in the unemployment rate has leveled off．The demand for labor remained strong throughout the year，but the month－to－month gains in nonfarm employment during the latter half of the year were smaller than the gains in the first half．

Other significant developments in the employment situation were：
1．Total employment rose by 1.9 million。 Employment growth was larger than the expansion in the labor force and unemployment was reduced by 480,000 ．The drop in unemployment was about the same as that from 1964 to 1965 ．

2．Manufacturing employment continued its upward advance in the first half of 1966 and thereafter slowed to a more moderate pace。 Manufacturing employment averaged 19 million－－up a million from 1965 and the largest annual gain in 15 years．

3．After reaching record postwar levels of 41.5 hours（seasonally adjusted）in the early part of the year，the average weekly hours of factory production workers leveled off and edged slightly downward to 41．0．Nevertheless，factory hours in 1966 averaged 41．4－－the highest level since World War II．Average weekly and hourly earnings rose to new highs．

4．Another substantial reduction was made in long－term unemployment in 1966， and the employment gain for teenagers was the largest on record．Although the jobless rate for Negroes continued to decline in 1966，the improvement was not as strong as that recorded by whites．

5．The tightness in the job market，evident in early 1966，eased slightly in mid－year，but shortages continued to exist in some occupations，industries，and areas throughout the year．

Although 1966 was the sixth consecutive year of economic expansion，it is obvious that it differed in important respects from the previous 5 years．The 1961－65 period had witnessed a smooth acceleration in aggregate demand and total output，but in 1966 national production reached near－capacity levels as demand continued to rise under the growing influence of military expenditures and high levels of business investment in plant and equipment．Inflationary pressures，evident in late 1965，materialized more fully by the opening months of 1966．For the first time in the course of the expansion，demand exceeded final output．By mid－year the situation had eased and growth in real gross national product fell to an annual average rate of 3 percent， compared to rates of 6 and 7 percent at the end of 1965 and in early 1966.

[^1]For the year as a whole, many of the major employment and unemployment indicators were at their most favorable levels in 13 years, although their rates of improvement in 1966 had slowed significantly.

## Employment Growth

Employment totaled 74. 1 million in 1966, up 1.9 million from 1965. The gain matched that of a year earlier and was 300,000 greater than the increase of 2 years ago. Teenagers accounted for two-fifths of the total gain in 1966, while adult females accounted for 45 percent. Adult males accounted for only one out of every eight new workers in 1966; their gain (250,000) was one-half as large as in 1965.

The comparatively small employment gain among adult male workers reflects the sustained high level of economic activity that the Nation has experienced since early 1961 and the consequent diminishing number of unemployed workers in this agesex group. By the first quarter of 1966, their jobless rate (seasonally adjusted) was down to 2.6 percent, and only 1.2 million were unemployed. Throughout the remainder of the year, the rate and level of unemployment for these workers remained virtually unchanged. Other evidence of near full employment was manifested in several of the key unemployment measures for this age-sex group:

1. The jobless rate for married men averaged 1.9 percent in 1966--the lowest since this series began in 1955 .
2. Only $l_{\text {。 }} 1$ million adult males in 1966 were jobless and looking for work, compared to nearly twice that number in 1963.
3. Twenty-five percent had been looking for work for more than 14 weeks. This compared to 31 percent in 1965.
4. Only half a million had been previously employed in a white-collar or skilled occupation in 1966, compared to 750,000 in 1963.
5. The number on economic part time (due to slack work, inability to find full-time work, etc.) in 1966 totaled 850,000 , compared to 1.2 million in 1963.

The available supply of labor in this critical age-sex group was drawn thin even in early 1966; this fact prompted employers to hire more women and teenagers. Adult female employment rose by 900,000 in 1966 , to 23.5 million. The expansion was greater than that of a year earlier. Teenage employment recorded its largest annual gain on record, rising by 750,000 to 6.9 million. In 1965 , teenage employment rose by 550,000 and, over the $1963-64$ period, by 250,000 .

Full-Time and Part-Time Workers. Of the total employment gain in 1966, approximately 75 percent was among workers on full-time work schedules. Although this proportion, as well as the absolute change, was smaller than that of a year earlier ( 95 percent), the proportion finding full-time jobs in 1966 continued to be above the trend of the late $1950^{\prime} \mathrm{s}$ and early $1960^{\prime} \mathrm{s}$.

Full-time and Part-time Employment Gains, 1963 to 1966
(In thousands)

|  | 1965-66 | 1964-65 | 1963-64 |
| :---: | :---: | :---: | :---: |
| Total increase | 1,886 | 1,822 | 1,548 |
| Full time | 1,452 | 1,727 | 1,311 |
| Part time (economic reasons).... | -257 | -246 | -165 |
| Part time (noneconomic reasons). | 594 | 311 | 409 |

The slowdown in full－time employment growth was more likely the result of the tight labor supply condition for adult males than of a decline in the demand for full－time workers．

The age－sex composition of the full－time employment expansion has undergone a marked change in the last 3 years．Adult males accounted for one－half of the increase in 1964，but in 1966 they contributed only one－sixth to the total．Teenagers， on the other hand，made up only a negligible amount of the gain 2 years ago，compared to roughly 32 percent this year．These developments reflect the changing nature of the labor supply over the last 2 years－－both the shortage of adult men available for work and the changing composition of the teenage labor force，a much higher pro－ portion of whom were 18－19 year－olds in 1966．

Although the intensity of business activity in the past 2 years has continued to reduce the number of unemployed men seeking full－time jobs（ 1.6 million in 1964 to 1.0 million in 1966）and adult women looking for full－time work（ 1 million to 750,000 ）， the number of teenagers looking for full－time jobs has remained unchanged．Employ－ ment gains for teenagers in the full－time labor force have only matched their burgeoning labor force increases of the past 2 years．

Another manifestation of the strong demand for full－time labor was the 250,000 reduction in the number of nonfarm workers on part time for economic reasons（such as slack work or inability to find a full－time job）．This decline was similar to that of a year ago。

Unlike the full－time labor force，the part－time labor force has had only small reductions in its rate of unemployment over the past 3 years．Employment gains have been sufficient to absorb the large number of part－time workers entering the labor force but not to reduce the number seeking part－time work at any one time．In 1966， over half a million part－time workers found employment，but this gain was matched by the rise in the part－time labor force。

A primary reason for the unyielding level of unemployment among part－time workers during the present expansion has been the large influx of teenage jobseekers． However，between 1965 and 1966，adult females have also entered the part－time labor force in greater numbers．These two groups of workers make up over 80 percent of all part－time jobseekers．

The availability of part－time jobs is much more critical for teenagers than for adult women．For every adult woman seeking a part－time job，there are four looking for full－time jobs．For every teenager seeking a part－time job，there are only about two looking for full－time jobs．Economic growth in the recent past has only created sufficient part－time jobs for teenagers to match their labor force increase；it is evident that to lower the rate of unemployment among teenage part－time jobseekers an even greater number of part－time jobs must be created．

Improvements in Unemployment
During 1964 and 1965，there was a continuous decline in the monthly unemploy－ ment rate；however，during 1966 the month－to－month unemployment rate（seasonally adjusted）fluctuated between 3.7 and 4.0 percent and ended the year at almost the same rate as it had started（ 4.0 percent in January 1966 and 3.8 percent in December 1966）．Nonetheless，the average level of unemployment in 1966 was 3.0 million，down 480,000 from the year before and at the lowest annual level since 1957 。

As the rate of unemployment fell below the 4 percent mark in 1966，the jobless rates for many groups of workers dropped to their most favorable levels in years． Rates below 3 percent were recorded for men aged 25 to 64 years and for women 45 years old and over．The rate for married men inched below the 2 percent level，and
the rate for all household heads averaged 2.2 percent. Jobless rates below 3 percent were registered also for workers in highly demanded occupations and industries (white-collar and skilled blue-collar occupations and in the metal-producing and -using industries of manufacturing)。

Further evidence of over-all improvement in the unemployment picture is available from special surveys of why jobseekers look for work. In 1966, it was found that an increasing proportion of those looking for work were doing so either for the first time or after a period of nonparticipation. In June 1964, 37 percent of the unemployed were looking for work because they had lost a job, but in June 1966 only 24 percent were job losers. Although June is the peak month for labor force entry, it was clear that over this period a substantial portion of the total unemployment decline took place among job losers.

Reasons for Looking for Work, June 1964 and 1966 (In thousands)

## Industrial Developments

Strong job gains occurred in the manufacturing sector of the economy in 1966. ${ }^{2}$ The gain of 1 million employees was the largest annual increase in 15 years and followed a 750, 000 increase in 1965. Despite tightness in the labor supply and the lowest jobless rate in the industry since 1953, manufacturers were able to boost total employment to 19.0 million.

The early months of 1966 tested the ability of manufacturers to meet increased product demand in the face of a tight labor market. The jobless rate had fallen to a very low level, and the supply of semiskilled workers had diminished. However, through a combination of increased overtime and stepped-up recruitment activities, manufacturers were able to meet production schedules.

Altogether, 15 of the 21 manufacturing industries registered greater job pickups than in 1965. As in 1965, most of the employment growth was concentrated in the durable-goods industries (nearly 80 percent)。 Metal-working and metal-using industries expanded by 650,000 , led by the electrical equipment industry $(225,000)$. The job increase in the electrical equipment industry was double that of a year earlier, reflecting the effect of greater defense needs. The employment gain in the transportation equipment industry $(170,000)$ was about 40,000 larger than that of a year ago. Unlike 1965 when the automobile industry accounted for most of the gain, employment

[^2]in the aircraft industry provided the major part of the increase in $1966(125,000)$. The increase in aircraft employment was the largest since the Korean conflict, and the industry's average workweek was at its highest level since that time ( 43.4 hours)。 The number of jobs in the machinery industry increased by 150,000 . The nondurablegoods sector increase was led by the paper, printing, chemicals, and rubber industries-each increasing by 30,000 or more.

The number of factory production workers advanced by 800,000 in 1966 to 14.2 million. This represented the largest number of factory workers employed since World War II, surpassing the cyclical highs of the 1956-57 and the Korean war periods. The rise in the number of factory workers since 1961 has provided the stimulus for a resurgence in blue-collar employment, especially semiskilled employment. Evidence of the strength and duration of the current boom is the fact that production worker employment in 11 of the 21 manufacturing industries surpassed levels of employment in other periods of peak cyclical activity occurring since World War II.

Over the postwar period, the proportion of nonproduction workers to total manufacturing employment had been steadily increasing until the present expansion. The nonproduction worker ratio leveled off at 26.0 percent in 1961-1964 and in the past 2 years dipped to 25.6 percent. In only one previous cyclical upturn since World War II, has this proportion declined (1958 to 1959).

The jobless rate in manufacturing fell even further in 1966 to 3.2 percent and reached its lowest point since 1953. Unlike 1965, when the rate displayed a marked decline in the latter half of the year, the manufacturing unemployment rate held steady throughout 1966.

Employment in contract construction totaled 3.3 million, up 100,000 over the year. The gain was close to that of the $1964-65$ period, although there was a distinct slowdown in the last half of the year as a result of the slump in residential construction. This slowdown was also reflected in the industry's rate of unemployment (seasonally adjusted) which averaged 9.0 percent in the fourth quarter compared to 7.5 percent in early 1966 .

The service-producing industries--transportation and public utilities, trade, government, services, and finance--provided more employment opportunities to the work force than ever before. Together they accounted for approximately l. 9 million new jobs, with each industry experiencing a larger gain than in the previous year.

Government employment shot up by three-quarters of a million, the largest increase of the post-World War II era. The gain was the result of increases of about 600,000 in State and local government jobs and 200,000 in Federal government employment.

The employment gain in trade $(525,000)$ was also the largest in nearly two decades; retail trade accounted for three-fourths of the total increase, although employment in retail trade in the latter half of the year grew at a slower rate than earlier in 1966. Job increases in the miscellaneous service industries totaled half a million-roughly 100,000 more than in the 1964 to 1965 period.

For the third straight year, employment in transportation and public utilities registered a healthy expansion ( 100,000 ) . Employment in this industry was approximately 100,000 short of the past cyclical highs of 1951-53 and 1956-57. Employment in mining held steady at 630,000 in 1966 , as it has since 1963 . The vitality of the current expansion has at least temporarily halted the long-run secular decline. Employment in agriculture recorded its largest drop since 1958 (380, 000). Although the long-run trend has been downward, it appeared that the rate of decline accelerated in 1966.

Hours and Earnings．The factory production worker＇s average workweek length－ ened again in 1966。 Hours increased by 0.2 hour over the year to an average of 41.4 hours，the highest level since World War II．The increase was accompanied by a further rise in average overtime hours－－from 3.6 to 3.9 hours．

Average weekly hours in late 1965 began to climb at an accelerated rate as manufacturing activity intensified．By February 1966，the workweek had risen to 41． 5 hours（seasonally adjusted），and until late spring held steady at this level；it was obvious that employers were meeting expanded production schedules by increasing overtime and by hiring additional workers．Both average overtime hours and the new hire rate were at their highest 1966 levels during this period．An early model change－ over in the auto industry in mid－summer reduced the length of the average workweek． Since that time hours have not returned to the levels of early 1966.

The hourly earnings of factory workers averaged \＄2．71 in 1966，up 10 cents from the 1965 average．The increase，amounting to 3.8 percent，was the largest annual gain since 1962．Nearly all of the increase was attributable to higher wage rates，but greater amounts of overtime at premium pay and the strong job gains in high wage industries had some effect on the average。

Gross average weekly earnings increased by $\$ 4.66$ in 1966，reaching a record level of \＄112．19．The rise（4．3 percent）was about the same as that of a year ago．Most of the advance（ 90 percent）was attributable to increased hourly earnings． Take－home pay（gross weekly earnings less Federal income and social security taxes） for workers with three dependents increased by $\$ 2.55$ to $\$ 99$ 。33．The increase was about half the size of the increase in each of the 2 prior years．The smaller gain was the result of the rise in social security taxes in January of 1966．If taxes had not been increased，the rise would have amounted to about $\$ 4.00$ 。 As a result of the more rapid increase in consumer prices，real take－home pay at $\$ 87.75$ was virtually un－ changed from a year ago．The average factory worker with three dependents worked more hours，earned more per hour，but received the same＂real＂take－home pay as in 1965 。

Average weekly earnings in the nonmanufacturing industries increased substan－ tially．The gains in mining（ 5.2 percent）and contract construction（ 5.2 percent） were the largest of the present expansion；the increases in the finance industries （ 4.0 percent）and trade（ 3.3 percent）were only slightly larger than the gains in 1965 。 Advances in weekly earnings in motor freight transportation，communications，and utilities were somewhat smaller than those of a year ago．

## Occupational Employment Gains

In response to the sustained high level of economic activity in 1966，employment gains continued among professional，clerical，skilled，semiskilled，and miscellaneous service workers．

Blue－collar employment growth in 1966 was slightly less than in 1965，although the advance $(700,000)$ was still the second largest of the current expansion．Employ－ ment among both skilled craftsmen and semiskilled operatives were at all－time highs as they topped the gains of a year earlier；however，the employment of unskilled blue－ collar laborers declined by 180,000 ．Much of this contrast was probably the result of a considerable movement of unskilled workers into jobs requiring higher skills which were in abundance throughout the course of the year and of the slowdown in the construction industry．

Employment among semiskilled blue－collar workers rose by nearly 500，000 in 1966．The operative growth since 1963 has been stimulated by the accelerated pro－ duction activity in the durable－goods sector of the economy．Between 1963 and 1964， this sector of the economy accounted for 40 percent of the employment gain in this
occupation group; a year later it accounted for 70 percent of the growth. Between 1965 and 1966 roughly 80 percent of the total increase occurred in hard-goods manufacturing.

The demand for skilled craftsmen remained high in 1966, as their employment rose by 375,000 . The scarcity of skilled craftsmen in 1966 was evident in their unemployment rate which dipped below 3.0 percent for the first time since 1953 and averaged 2.8 percent. Employment for these workers was concentrated in manufacturing and the construction industry.

White-collar employment growth in 1966 surpassed that of a year earlier, increasing by 1.2 million. Most of the increase was concentrated in the professional and clerical occupations. The demand for such workers has remained high throughout the post-World War II period. The increases in both professional ( 450,000 ) and clerical employment ( 700,000 ) were the largest of the present expansion, and for clerical workers the largest in two decades. Clerical jobs have been a main source of employment opportunities for teenagers in recent years. In 1966 approximately 2 out of every 5 new clerical jobs were obtained by teenagers.

Employment in the sales occupations was virtually unchanged in 1966, compared to a substantial advance in 1965. Employment among managers, officials, and proprietors was also unchanged from a year ago.

Service workers contributed 325,000 to the rise in total employment in 1966; this increase was attributable entirely to the gain among miscellaneous service workers (excluding private household workers). Miscellaneous service employment, which had recorded an average annual gain of 150,000 between 1947 and 1961 , increased, on the average, by 225,000 during the present expansion. Private household employment increased annually by an average of 40,000 between 1947 and 1961 but has shown no growth since then. It is quite likely that the increased demand for service workers and the availability of higher paying jobs have inhibited private household employment growth.

## Labor Surplus Problems

Negro Workers. ${ }^{3}$ The unemployment rate for nonwhite workers averaged 7. 5 percent in 1966 , down 0.8 percentage point from 1965. Despite this, there was a slight slowdown in the rate of improvement in the unemployment situation for Negroes relative to whites. Between 1963 and 1965 , 25 percent of the total decline in unemployment was among Negroes, but in 1966 this proportion declined to 11 percent. Furthermore, the jobless rate for Negroes, which had declined steadily between 1963 and early 1966, edged upward toward mid-year and failed to return to the 7.1 percent rate (seasonally adjusted) established in the first quarter. This development was particularly disappointing since the rate for white workers held steady throughout the year at around 3. 4 percent.

One of the most disturbing areas of Negro unemployment has been among teenagers. Despite concerted efforts to combat this problem, Negro boys and girls continued to experience shockingly high rates of unemployment in 1966 (21. 2 percent for boys and 31.1 percent for girls). Although there has been some improvement for white teenagers recently, Negro teenagers have not kept pace. In 1963, the jobless rate for Negro boys was 1.8 times as large as that for white boys compared to 2.1 in 1966; for Negro girls the differential has moved from 2. 4:1 to 2. 8:1 over the same period. Since Negro teenagers will account for a larger proportion of the teenage

[^3]population in years to come, this problem will probably become more serious.

## Table 1. Labor Force Status of Nonwhites and Whites, 1963 to 1966 (In thousands)

Teenagers. Teenagers entered the labor force in unprecedented numbers in $1966(750,000)$. All of these workers were able to find employment due to the high level of economic activity and the concerted efforts on the part of governments, private industry, and community organizations. In this respect the teenage job situation in 1966 closely resembled that of 1965.

Teenage unemployment has been one of the most troublesome manpower problems of the $1960^{\prime} s$. Between 1963 and 1966, teenage joblessness has held steady at 1.0 million and as a result has steadily made up a larger proportion of total unemployment. At the same time, more than 1.5 million teenagers entered the labor force--more than were added over the entire 10 -year period from 1953 to 1963. The generation of enough jobs for this large increase in the teenage labor force, preventing their jobless level from rising further, has been one of the major achievements of the current expansion. Nevertheless, their rate of unemployment in 1966, at 12.0 percent, was slightly more than 3 times larger than the total rate. Furthermore, since 1963 this relationship has tended to edge upward (from 2.7:1 in 1963 to $3.1: 1$ in 1966).

Over the past 3 years, an increasing proportion of teenagers have found fulltime jobs. In 1964, nearly all of the increase in teenage employment occurred among part-time workers; in 1966, 54 percent of the gain was among full-time workers. Two factors account for this development: 1) the abundance of full-time employment opportunities in a rapidly expanding economy; and 2) a large increase in the number of teenagers aged 18 to 19 years who were entering the labor force in quest of their first full-time jobs.

Long-Term Unemployment. The average number of workers unemployed for 15 weeks or longer was further reduced in 1966 as the economy's sustained growth continued to reach the hard-core unemployed. The reduction in long-term unemployment ( 225,000 ) was equivalent to that of 1965 and cut the total to nearly half a million-0.7 percent of the civilian labor force. In the current upswing, total unemployment has declined by roughly 1.8 million, and long-term unemployment accounted for 55 percent of this drop. Compared to previous cyclical upturns, this represents a vast improvement and can be attributed only to the strength and duration of the present expansion.

Reductions in long-term joblessness were evident in nearly all nonagricultural industries and all nonfarm occupation groups. Particularly sharp reductions were noted in industries and occupations of high labor demind, such as manufacturing and
among skilled and semiskilled workers．At the same time，the number of new labor force entrants experiencing long－term joblessness fell substantially in 1966。 Long－ term unemployment among persons with no previous work experience declined from 17 percent of their unemployment in 1965 to 13 percent in 1966．Among Negroes the reductions in extended joblessness matched those of a year earlier．The ability of the economy to reduce extended joblessness among experienced workers，as well as among labor force entrants，reflects the pervasiveness of the labor demand situation in 1966。

For the second year in a row，over one－half of the unemployed had been looking for work for less than 5 weeks．In 1966，approximately 55 percent of the total unemployed had been jobless less than 5 weeks and this was the highest proportion since 1953．Such a development is typical during periods of high economic activity when job changing becomes more prevalent．At the same time，the addition to the labor force of teenagers and married women has added to the number of short－term jobseekers．Undoubtedly，were it not for the abundance of employment opportunities in recent years，the proportion of such jobseekers experiencing extended joblessness would be substantially higher．

## Labor Force Participation by Age，Sex，and Color

Participation rates for men in the central age groups（ 25 to 54 years）have remained above 95 percent since the end of World War II．In 1966，the rate of labor force participation for adult men was virtually unchanged．The recent decline in the rate for men aged 55 to 64 years was nearly halted in 1956 at 84.6 percent；however， the long－run downtrend in the participation rate for older men（ 65 years and over） continued in 1966，as their rate moved down to 27.0 percent．

Participation rates of women aged 25 to 54 years continued to more up in 1966. Of particular interest was the acceleration in the worker rate for women aged 25 to $34--a n$ age group in which labor force activity is often restricted due to the presence of small children in the family．Throughout the $1950^{\prime} \mathrm{s}$ and early part of this decade， their work rate had been stable in the narrow range of 34 to 36 percent．By 1966， however，their rate had risen to nearly 40 percent．

Between 1956 and 1963，the participation rate for teenage males declined from 51． 4 percent to 43.5 percent．However，since 1963 ，older teenagers（ 18 to 19 years old）have become a larger proportion of the teenage labor force relative to younger teenagers（ 14 to 17 years old）。 Older teenagers usually have higher participation rates，and as a result the teenage male participation rate has edged upward and in 1966 was 45.7 percent．（About 70 percent of all males 18 to 19 years of age partici－ pate in the labor force compared to rates of 47 percent for 16 to 17 year－olds and 22 percent for those 14 to 15．）The labor force participation rate for teenage girls in 1966 was 32 percent－－ 4 percentage points greater than in 1964．The increase in the number of 18 and 19 year－old girls accounted for the recent increase in the rate for teenage girls．

For 20 to 24 year－old males，the participation rate has gradually edged down－ ward since the mid－1950＇s．The primary reason for this development has been later labor force entry resulting from lengthening school attendance．＇This group＇s work rate was unchanged in 1966 ，however，$a \pm 83.0$ percent as the expansion of the Armed Forces halted any further decline．Their employment showed little change in 19.56 compared to an average annual gain of 200,000 between 1901 and 1965 ，but unemployment declined by its largest amount（ 100,000 ）since the current expansion got underway． Furthermore，a slightly smaller proportion of the total number in this age group were in school in 1966 compared to 1965 （ 9.2 percent vs． 9.7 percent）．Most of the recent increase in the Armed Forces occurred among young men，and it was evident that activity patterns of many men with unfulfilled military obligations were altered in 1966 as military manpower needs increased．

Historically, the proportion of nonwhite adult men in the labor force has been slightly lower than that of white men, while for nonwhite women, worker rates have been higher than for white women. In 1966, there was no significant narrowing in these gaps.

Table 2. Civilian Labor Force Participation Rates, $1 /$ by Color, Sex, and Age, 1956, 1961, and 1966

| Age-sex | White |  |  | Nonwhite |  |  |

| 55-64 years. | 41.1 | 37.2 | 34.0 | 49.1 | 45.2 | 44.5 |
| 65 years and over | 9.4 | 10.5 | 10.6 | 13.0 | 13.1 | 14.5 |

1/ Percent of civilian noninstitutional population in the civilian labor force.

Participation rates among Negro adult men aged 25 to 54 years failed to show any significant increases in 1966. ${ }^{4}$ Negro men aged 45 to 54 years in fact showed further withdrawal; their rate fell from 92.0 percent in 1965 to 90.7 percent in 1966. For whites of the same age group there was !ittle change in the worker rate。 While participation in the labor force for white teenage boys increased, the rate for Negro boys was unchanged.

Adult Negro women recorded a modest increase in their participation rates in 1966 as did white adult women. Participation for Negro women 25 to 34 years has increased rapidly in the $1960^{\prime} \mathrm{s}$, in contrast to developments in the $1950^{\prime} \mathrm{s}$. Negro teenage girls increased their work rate to nearly 25 percent; white teenage girls also experienced an increase.

## Labor Shortages

Labor shortages in 1966 continued to attract the attention of government and business officials alike. After reaching its most critical point in the early months of 1966, the tight manpower situation eased somewhat, due to the more moderate growth of the economy since spring. This easing undoubtedly provided employers time to redesign jobs, making them more compatible with the declining skill level of the available labor supply. In the fourth quarter of 1966 , however, shortages continued to be evident in some occupations, industries, and areas.

[^4]In the fourth quarter, approximately the same number of workers were unemployed as in the early part of the year ( 2.9 million, seasonally adjusted) . Furthermore, the composition of total unemployment had changed very little. There were approximately the same number of unemployed skilled, semiskilled, and unskilled blue-collar workers ( 1.0 million) ; only 100,000 fewer adult males looking for work; and approximately the same number of experienced wage and salary jobseekers. Thus, the labor supply-demand relationship was not substantially different between the first and fourth quarters.

Table 3. Selected Measures of Unemployment in Periods of Tight Labor Supply, 1966 and 1952

| Unemployment | 1966 |  | 1966 | 1952 |
| :---: | :---: | :---: | :---: | :---: |

| Total................................... . | 3.8 | 3.8 | 3.9 | 3.1 |
| Experienced wage and salary workers... | 3.5 | 3.4 | 3.5 | 2.9 |
| Men, 20 years and over................. | 2.4 | 2.6 | 2.5 | 2.4 |
| Blue-collar workers..................... | 4.2 | 4.1 | 4.2 | 3.6 |
| Craftsmen. . . . . . . . . . . . . . . . . . . . . . . . | 2.8 | 3.0 | 2.8 | 2.4 |
| Operatives............................. | 4.2 | 4.2 | 4.3 | 3.9 |
| Nonfarm laborers....................... | 7.6 | 6.7 | 7.3 | 5.7 |

During the Korean conflict tightness in the labor supply was also evident. A comparison of the present situation with that during the Korean conflict places the present developments in perspective. Some of the most significant comparisons appear below:

1) In $1966,3.0$ million people were unemployed, compared to 1.9 million in 1952. Adult males, however, made up over one-half of the total in 1952, compared to 38 percent in 1966 .
2) The jobless rate for skilled blue-collar workers, at 2.8 percent in 1966, was nearly one-half of a percentage point higher than in 1952, and the rates for other blue-collar workers were also above those of 14 years earlier.
3) The workweek of factory production workers in 1966 averaged 41.4 hours, 0.7 hour more than in 1952. Employers relied much more heavily on increased hours in 1966 than in 1952 for meeting production demands.
4) There was no civilian labor force growth during the Korean war period, compared to an annual average gain of 1.3 million in the 1963 to 1966 period.
5) The number of unemployed experienced wage and salary workers totaled l. 5 million in 1952 , compared to 2.3 million in 1966.

It was apparent in 1966 that the Nation's labor force was not so fully employed as it was in 1952 and that the potential for further employment growth was far greater,

It is likely that the labor shortage situation in 1967 will be no more acute than in 1966. Indications of weakness in some segments of the economy have increased in the closing months of 1966. Spending for plants and equipment will probably increase at a slower rate in 1967. At the beginning of 1967, considerably more uncertainties exist concerning the future course of the boom than in late 1965.

## UNEMPLOYMENT RATES BY COLOR <br> 1954 to date

Table A-1: Employment status of the noninstitutional population 14 years and over, 1929 to date

Data for 1947.56 adjusted to reflect changes in the definition of employment and unemployment adopted in January 1957. Two groups averaging about onequarter million workers which were formerly classified as employed (with a job but not at work)-those on termporary layoff and those waiting to start new wage and salary jobs within 30 days-were assigned to different classifications, mostly to the unemployed. Data by sex, shown in table A-2, were adjusted for the years 1948 - 56 .
${ }^{2}$ Not available.
${ }^{3}$ Beginping 1953, labor force and employment figures ate not strictly comparable with previous years as a result of the introduction of material from the 1950 Census into the escimating procedure. Population levela were raised by about 600,000 ; labor force, total employment, and agricultural employment by about 350,000 , primarily affecting the figures for total and males. Other categories were relatively unaffected.
bata include Alaska and Hawaii beginning 1960 and are therefore not strictly comparable with previous years. This inclusion has resulted in an increase of about half a million in the noninstritutional population 14 years of age and over, and about 300,000 in the labor force, four-fifths of this in nonagricultural employment. The levels of other Labor force categories were not appreciably changed.
${ }^{5}$ Figures for periods prior to April 1962 are dot strictly comparable with current data because of the incroduction of 1960 Census data into the estimation procedure. The change primarily affected the labor force and employment totals, which were reduced hy about 200,000 . The unemployment totals were virtually uncbanged.

NOTE: Data for 1929-39 based an mources other thap direct eaumetation.

IFor mining and manufacturing, data refer to production and related workers; for contract construction, to construction workers; and for all other industries,
to nonsupervisory workers.
2Beginning January 1965 , data relate to railroads with operating revenues of $\$ 5,000,000$ or more.
3Dara for nonsupervisory vorkers exclude messengers.
${ }^{4}$ Data for nonoffice salesmen excluded from nonsupervisory count for all series in this division.
${ }^{5}$ Prepared by the U.S. Civil Service Commission. Data relate to civilian employment only and exclude Central Intelligence mad National Security Agencies.

- Not available.

NOTE: Dasa for the 2 most recent months are preliminary.

Table B-4: Indexes of employment on nonagricultural payrolls, by industry division, 1919 to date, monthly data seasonally adjusted 1957-59=100

Dana for the 2 most recent monchs and 1966 anmal averaged are prelimimary.

Table B-5: Employees on nonagricultural payrolls by industry, seasonally adiusted

${ }_{2}$ Combined with service.
2 Series revised to 1966 benchmark; not strictly comparable with previously published data.
3 Combined with construction.
${ }^{4}$ Federal employment in Maryland and Virginia sectors of the Washington Metropolitan Statistical Area
is included in data for the District of Columbia.
5 Not available.
6 Initial inclusion in this publication (see area definition on opposite page.)
7 Series revised to 1965 benchmark; not strictly comparable with previousiy published data.
${ }^{a}$ Combined with manufacturing.
9 Area Included in New York-Northeastern New Jersey Standard Consolldated Area.
${ }^{10}$ Subarea of Rochester Standard Metropolitan Statistical Area.
11 Subarea of New York Standard Metropolitan Statistical Area.
12 Total includes data for industry divisions not shown separately. NOTE: Data for the current month are preliminary.

${ }^{1}$ For mining and manufacturing, data refer to production and related workers; for contract construction, to construction workers; and for all other industries, to nonsupervisory workers.
${ }^{2}$ Beginning January 1965, data relare to railroads with operating revenues of $\$ 5,000,000$ or more. July 1966 data aret $\$ 134.21$, $\$ 3.09$, and 43.4. Data relate to employees in such occupations in the telephone industry as switchboard operators; service assistants; operating room instructors; and pay-station attendants. In 1965, such employees made up 33 percent of the total number of nonsupervisory employees in establishments reporting hours and earnings data.
${ }^{4}$ Data relate to employees in such occupations in the telephone industry as central office craftsmen; installation and exchange repair craftsmea; line, cable, and conduit craftsmen; and laborers. In 1965, such employees made up 33 percent of the total numher of nonsupervisory employees in establishments reportiog hours and earnings daca.
${ }^{5}$ Data relate to nonsupervisory employees except messengers
${ }^{6}$ Woney payments only; tips, not included.
${ }^{7}$ Data for nonoffice salesmen excluded from all series in this division.
${ }^{*}$ Not available.
NOTE: Data for the 2 most recent months are preliminary.

## ESTABLISHMENT DATA HOURS AND EARNINGS

Table C-3: Employment, hours, and indexes of earnings in the Executive Branch of the Federal Government (Employment in chousands-includes boch supervisory and nonsupervisory employees)

NOTE: Averages presented in his table have beea computed usiog data collected by the U.S. Civil Service Commission from all agencies of the executive branch of the Federal Government be data cover both salaried workers and bourly paid wage-board employees. Siace these averages relate to hours and earnings of all workers, borh supervisory and nonsupervisory, they are not the data cover both salaried workers and hourly paid wage-board employees. Siace these averages relate to hor

${ }^{1}$ Based on unrounded data; changes of less than 50 not shown.
${ }^{2}$ Include data under the program for Puerto Rico's sugarcane workers. Rates exclude the sugarcane workers as comparable covered employment data are not yet available.
*Excludes insured unemploypent under extended duration provisions of regular State laws.

Table E-2: Insured unemployment' in 150 major labor areas ${ }^{2}$

${ }^{1}$ Insured jobless under State, Pederal Employee, and Ex-Servicemen's unemployment insurance prograns.
${ }^{2}$ For full name of labor area, see Area Trends in Employment and Unemployment published by the Burean of Employment Security.
*Excludes insured umerployed under extended duration provisions of regular state laws.

# ANNUAI AVERAGE TABLES 

## CONTENTS

## LABOR FORCE, EMPLOYMENT, AND UNEMPLOYMENT

The annual series of Special Labor Force Reports presenting detailed monthly and annual average data on the labor force and employment status of the population is being discontinued due to the increased availability of manpower statistics in this and other publications. Tables which were previously published in this annual report and which do not appear elsewhere will be available upon request. The analytical report, "The Employment Situation in 1966," appears in this issue of Employment and Earnings and Monthly Report on the Labor Force.

1. Employment status of the noninstitutional population 14 years and over, by sex and color. ..... 94
2. Full- and part-time status of the civilian labor force, by age and sex ..... 94
3. Unemployed persons, by age and sex. ..... 95
4. Unemployed persons, by industry of last job ..... 95
5. Unemployed persons, by occupation of last job ..... 96
6. Unemployed persons, by marital status and household relationship ..... 96
7. Employment status of persons 16-2l years of age in the. noninstitutional population, by color ..... 96
8. Unemployed persons, by duration of unemployment ..... 97
9. Long-term unemployed by industry and occupation of last job ..... 97
10. Long-term unemployed, by sex, age, color, and marital status ..... 98
11. Unemployed persons looking for full- or part-time work, by age and sex. ..... 98
12. Total labor force, by age and sex ..... 99
13. Employed persons, by age and sex ..... 99
14. Employed persons, by class of worker and occupation ..... 99
15. Employed persons, by hours worked ..... 100
16. Employed persons, by full- or part-time status ..... 100
17. Employed persons with a job, but not at work, by reason not working and pay status ..... 100
18. Employment status of the noninstitutional population, by age and sex ..... 101
19. Nonagricultural wage and salary workers, by full- or part-time status, hours of work, and industry ..... 101
20. Persons at work in nonfarm occupations by full- or part-time status, hours of work, and occupation ..... 102
21. Occupation group of employed persons, by sex and color ..... 102
22. Persons at work in nonagricultural industries, by full-time and part-time status, hours of work, and selected characteristics ..... 103
23. Persons at work, by hours of work, and class of worker ..... 103
PAYROLL EMPLOYMENT, HOURS AND EARNINGS, BY INDUSTRY
24. Employees on nonagricultural payrolls, by industry ..... 104
25. Production workers on payrolls of selected industries ..... 105
26. Gross hours and earnings of production workers on payrolls of selected industries. ..... 105

For mining and manufacturing, data refer to production and related workers; for contract construction, to construction workers; and for all other industries, to nonsupervisory workers.
${ }^{2}$ Preliminary unweighted averages.
${ }^{3}$ Beginning 1964, data include eating and drinking places.

# QUARTERLY AVERAGE TABLES 

## 4th Quarter 1966

## CONTENTS

Page

- Employment status of the noninstitutional population 14 years and over, by sex and color. ..... 107

2. Full- and part-time status of the civilian labor force, by age and sex ..... 107
3. Unemployed persons, by age and sex ..... 108
4. Unemployed persons, by industry of last job ..... 108
5. Unemployed persons, by occupation of last job ..... 109
6. Unemployed persons, by marital status and household relationship ..... 109
7. Employment status of persons 16-21 years of age in the noninstitutional population, by color ..... 109
8. Unemployed persons, by duration of unemployment ..... 110
9. Long-term unemployed, by industry and occupation of last job ..... 110
10. Long-term unemployed, by sex, age, color, and marital status ..... 111
11. Unemployed persons looking for full- or part-time work, by age and sex ..... 111
12. Total labor force, by age and sex ..... 112
13. Employed persons, by age and sex. ..... 112
14. Employed persons, by class of worker and occupation ..... 112
15. Employed persons, by hours worked ..... 113
16. Employed persons, by full- or part-time status ..... 113
17. Employed persons with a job, but not at work, by reason not working and pay status ..... 113
18. Summary employment and unemployment estimates, by age and sex, seasonally adjusted ..... 114
19. Seasonally adjusted rates of unemployment ..... 114
20. Unemployed persons by duration of unemployment, seasonally adjusted ..... 114
21. Rates of unemployment by age and sex, seasonally adjusted ..... 115
22. Employed persons by age and sex, seasonally adjusted. ..... 115
23. Employment status by color, sex, and age, seasonally adjusted ..... 116
24. Total employment and unemployment rates, by occupation, seasonally adjusted ..... 116

Additional information concerning the preparation of the labor force, employment, hours and earnings, and labor turnover series--concepts and scope, survey methods, and limitations--is contained in technical notes for each of these series, available from the Bureau of Labor Statistics free of charge.

## INTRODUCTION

The statistics in this periodical are compiled from three major sources: (1) household interviews, (2) payroll reports from employers; and (3) administrative statistics of unemployment insurance systems.

Data based on household interviews are obtained from a sample survey of the population. The survey is conducted each month by the Bureau of the Census for the Bureau of Labor Statistics and provides comprehensive data on the labor force, the employed and the unemployed, including such characteristics as age, sex, color, marital status, occupations, hours of work, and duration of unemployment. The information is collected by trained interviewers from a sample of about 35,000 households, representing 357 areas in 701 counties and independent cities, with coverage in 50 States and the District of Columbia. The data collected are based on the activity or status reported for the calendar week including the 12th of the month.

Data based on establishment payroll records are compiled each month from mail questionnaires by the Bureau of Labor Statistics, in cooperation with State agencies. The payroll survey provides detailed industry information on nonagricultural wage and salary employment, average weekly hours, average hourly and weekly earnings, and labor turnover for the Nation, States, and metropolitan areas. The figures are based on payroll reports from a sample of establishments employing about 25 million nonfarm wage and salary workers. The data relate to all workers, full- or part-time, who received pay during the payroll period which includes the 12th of the month.

Data based on administrative records of unemployment insurance systems furnish a complete count of insured unemployment among the two-thirds of the Nation's labor force covered by unemployment insurance programs. Weekly reports, by State, are issued on the number of initial claims, the volume and rate of insured unemployment under State unemployment insurance programs, and the volume under programs of unemployment compensation for Federal employees, exservicemen, and for railroad workers. These statistics are published by the Bureau of Employment Security, U.S. Department of Labor in 'Unemployment Insurance Claims."

## Relation between the household and payroll series

The household and payroll data supplement one another, each providing significant types of information that the other cannot suitably supply. Population characteristics, for example, are readily obtained only from the household survey whereas detailed industrial classifications can be reliably derived only from establishment reports.

Data from these two sources differ from each other because of differences in definition and coverage, sources of information, methods of collection, and estimating procedures. Sampling variability and response errors are additional reasons for discrepancles. The major factors which have a differential effect on levels and trends of the two series are as follows:

## Employment

Coverage. The household survey definition of employment comprises wage and salary workers (including domestics and other private household workers), selfemployed persons, and unpaid workers who worked 15 hours or more during the survey week in family-operated enterprises. Employment in both farm and nonfarm industries is included. The payroll survey covers only wage and salary employees on the payrolls of nonfarm establishments.

Multiple jobholding. The household approach provides information on the work status of the population without duplication since each person is classified as employed, unemployed, or not in the labor force. Employed persons holding more than one job are counted only once, and are classified according to the job at which they worked the greatest number of hours during the survey week. In the figures based on establishment records, persons who worked in more than one establishment during the reporting period are counted each time their names appear on payrolls.

Unpaid absences from jobs. The household survey includes among the employed all persons who had jobs but were not at work during the survey week--that is, were not working or looking for work but had jobs from which they were temporarily absent because of illness, bad weather, vacation, labor-management dispute, or because they were taking time off for various other reasons, even if they were not paid by their employers
for the time off. In the figures based on payroll reports, persons on leave paid for by the company are included, but not those on leave without pay for the entire payroll period.

## Hours of Work

The household survey measures hours actually worked whereas the payroll survey measures hours paid for by employers. In the household survey data, all persons with a job but not at work are excluded from the hours distributions and the computations of average hours. In the payroll survey, employees on paid vacation, paid holiday, or paid sick leave are included and assigned the number of hours for which they were paid during the reporting period.

## Comparability of the household interview data with other series

Unemployment insurance data. The unemployed total from the household survey includes all persons who did not work at all during the survey week and were looking for work or were waiting to be called back to a job from which they had been laid off, regardless of whether or not they were eligible for unemployment insurance. Figures on unemployment insurance claims, prepared by the Bureau of Employment Security of the Department of Labor, exclude persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (agriculture, State and local government, domestic service, self-employed, unpaid family work, nonprofit organizations, and firms below a minimum size).

In addition, the qualifications for drawing unemployment compensation differ from the definition of unemployment used in the household survey. For example, persons with a job but not at work and persons working only a few hours during the week are sometimes eligible for unemployment compensation, but are classified as employed rather than unemployed in the household survey.

Agricultural employment estimates of the Department of Agriculture. The principal differences in coverage
are the inclusion of persons under 14 in the Statistical Research Service (SRS) series and the treatment of dual jobholders who are counted more than once if they worked on more than one farm during the reporting period. There are also wide differences in sampling techniques and collecting and estimating methods, which cannot be readily measured in terms of impact on differences in level and trend of the two series.

## Comparability of the payroll employment data with other series

Statistics on manufactures and business, Bureau of the Census. BLS establishment statistics on employment differ from employment counts derived by the Bureau of the Census from its censuses or annual sample surveys of manufacturing establishments and the censuses of business establishments. The major reasons for some noncomparability are different treatment of business units considered parts of an establishment, such as central administrative offices and auxiliary units, the industrial classification of establishments, and different reporting patterns by multiunit companies. There are also differences in the scope of the industries covered, e.g., the Census of Business excludes contract construction, professional services, public utilities, and financial establishments, whereas these are included in BLS statistics.

County Business Patterns. Data in County Business Patterns, published jointly by the U.S. Departments of Commerce and Health, Education, and Welfare, differ from BLS establishment statistics in the treatment of central administrative offices and auxiliary units. Differences may also arise because of industrial classification and reporting practices. In addition, CBP excludes interstate railroads and government, and coverage is incomplete for some of the nonprofit activities.

Employment covered by State unemployment insurance programs. Not all nonfarm wage and salary workers are covered by the unemployment insurance programs. All workers in certain activities, such as interstate railroads, are excluded. In addition, small firms in covered industries are also excluded in 32 States. In general, these are establishments with less than four employees.

## Labor Force Data

## COLLECTION AND COVERAGE

Statistics on the employment status of the population, the personal, occupational, and other economic characteristics of employed and unemployed persons, and related labor force data are compiled for the BLS by the Bureau of the Census in its Current Population Survey (CPS). A detailed description of this survey appears in "Concepts and Methods Used in Household Statistics on Employment and Unemployment from the

Current Population Survey', (BLS Report 279). This report is available from BLS on request.

These monthly surveys of the population are conducted with a scientifically selected sample designed to represent the civilian noninstitutional population 14 years and over. Respondents are interviewed to obtain information about the employment status of each member of the household 14 years of age and over. The inquiry relates to activity or status during the calendar week,

Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted in the following week.

Inmates of institutions and persons under 14 years of age are not covered in the regular monthly enumerations and are excluded from the population and labor force statistics shown in this report, Data on members of the Armed Forces; who are included as part of the categories "total noninstitutional population" and "total labor force," are obtained from the Department of Defense.

Each month, 35,000 occupied units are designated for interview. About l,500 of these households are visited but interviews are not obtained because the occupants are not found at home after repeated calls or are unavailable for other reasons. This represents a noninterview rate for the survey of about 4 percent. In addition to the 35,000 occupied units there are 5,000 sample units in an average month which are visited but found to be vacant or otherwise not to be enumerated. Part of the sample is changed each month. The rotation plan provides for three-fourths of the sample to be common from one month to the next, and one-half to be common with the same month a year ago.

## CONCEPTS

Employed persons comprise (a) all those who during the survey week did any work at all as paid employees, in their own business profession, or on farm, or who worked 15 hours or more as unpaid workers in an enterprise operated by a member of the family, and (b) all those who were not working or looking for work but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, labormanagement dispute, or personal reasons, whether or not they were paid by their employers for the time off.

Each employed person is counted only once. Those who held more than one job are counted in the job at which they worked the greatest number of hours during the survey week.

Included in the total are employed citizens of foreign countries, temporarily in the United States, who are not living on the premises of an Embassy.

Excluded àre persons whose only activity consisted of work around the house (such as own home housework, and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations.

Unemployed persons comprise all persons who did not work at all during the survey week and were looking for work, regardless of whether or not they were eligible for unemployment insurance. Also included as unemployed are those who did not work at all and (a) were waiting to be called back to a job from which they had been laid off; or (b) were waiting to report to a new wage or salary job within 30 days (and were not in school
during the survey week); or (c) would have been looking for work except that they were temporarily ill or believed no work was available in their line of work or in the community.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work or would have been looking for work except for temporary illness, or belief that no work was available in their line of work or in the community. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of seeking work. Average duration is an arithmetic mean computed from a distribution by single weeks of unemployment.

The civilian labor force comprises the total of all civilians classified as employed or unemployed in accordance with the criteria described above. The "total labor force" also includes members of the Armed Forces stationed either in the United States or abroad.

The unemployment rate represents the number unemployed as a percent of the civilian labor force. This measure can also be computed for groups within the labor force classified by sex, age, marital status, color, etc.

Not in labor force includes all civilians 14 years and over who are not classified as employed or unemployed. These persons are further classified as "engaged in own home housework," "in school," "unable to work" because of long-term physical or mentalillness, and "other." The "other" group includes for the most part retired persons, those reported as too old to work, the voluntarily idle, and seasonal workers for whom the survey week fell in an "off" season and who were not reported as unemployed. Persons doing only incidental unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation, industry, and class of worker for the employed apply to the job held in the survey week, Persons with two or more jobs are classified in the job at which they worked the greatest number of hours during the survey week. The unemployed are classified according to their latest full-time civilian job lasting 2 weeks or more. The occupation and industry groups used in data derived from the CPS household interviews are defined as in the 1960 Census of Population. Information on the detailed categories included in these groups is available upon request.

The class-of-worker breakdown specifies "wage and salary workers," subdivided into private and government workers, "self-employed workers," and "unpaid family workers." Wage and salary workers receive wages, salary, commission, tips, or pay in kind from a private employer or from a governmental unit. Self-employed persons are those who work for profit or fees in their
own business, profession, or trade, or operate a farm. Unpaid family workers are persons working without pay for 15 hours a week or more on a farm or in a business operated by a member of the household to whom they are related by blood or marriage.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, a person who normally works 40 hours a week but who was off on the Veterans Day holiday would be reported as working 32 hours even though he was paid for the holiday.

For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the week. However, all the hours are credited to the major job.

Persons who worked 35 hours or more in the survey week are designated as working "full time"; persons who worked between 1 and 34 hours are designated as working "part time." Part-time workers are classified by their usual status at their present job (either full time or part time) and by their reason for working part time during the survey week (economic or other reasons). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. "Other reasons" include: Labor dispute, bad weather, own illness, vacation, demands of home housework, school, no desire for full-time work and full-time worker only during peak season. Persons on full-time schedules include, in addition to those working 35 hours or more, those who worked from 1-34 hours for noneconomic reasons but usually work full time.

Full- and part-time labor force. The full-time labor force consists of persons working on full-time schedules, persons involuntarily working part time (because fulltime work is not available) and unemployed persons seeking full-time jobs. The part-time labor force consists of persons working part time voluntarily and unemployed persons seeking part-time work. Persons with a job but not at work during the survey week are distributed proportionately between the full-time and voluntary parttime employment categories.

Labor force time lost is a measure of man-hours lost to the economy through unemployment and involuntary part-time employment and is expressed as a percent of potentially available man-hours. It is computed by assuming: (1) that unemployed persons looking for full-time work lost an average of 37.5 hours, (2) that those looking for parttime work lost the average number of hours actually worked by voluntary part-time workers during the survey week, and (3) that persons on part time for economic reasons lost the difference between 37.5 hours and the actual number of hours they worked.

## ESTIMATING METHODS

Under the estimation methods used in the CPS, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. There are no subsequent adjustments to independent benchmark data on labor force, employment, or unemployment. Therefore, revisions of the historical data are not an inherent feature of this statistical program.

1. Noninterview adjustment. The weights for all interviewed households are adjusted to the extent needed to account for occupied sample households for which no information was obtained because of absence, impassable roads, refusals, or unavailability for other reasons. This adjustment is made separately by groups of sample areas and, within these, for six groups--color (white and nonwhite) within the three residence categories (urban, rural nonfarm, and rural farm). The proportion of sample households not interviewed varies from 4 to 6 percent depending on weather, vacations, etc.
2. Ratio estimates. The distribution of the population selected for the sample may differ somewhat, by chance, from that of the Nation as a whole, in such characteristics as age, color, sex, and residence. Since these population characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio estimates as follows:
a. First-stage ratio estimate. This is the procedure in which the sample proportions are weighted by the known 1960 Census data on the color-residence distribution of the population. This step takes into account the differences existing at the time of the 1960 Census between the color-residence distribution for the Nation and for the sample areas.
b. Second-stage ratio estimate. In this step, the sample proportions are weighted by independent current estimates of the population by age, sex, and color. These estimates are prepared by carrying forward the most recent census data (1960) to take account of sub. sequent aging of the population, mortality, and migration between the United States and other countries.
3. Composite estimate procedure. In deriving statistics for a given month, a composite estimating procedure is used which takes account of net changes from the previous month for continuing parts of the sample (75 percent) as well as the sample results for the current month. This procedure reduces the sampling variability especially of month-to-month changes but also of the levels for most items.

## Reliability of the Estimates

Since the estimates are based on a sample, they may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures.

The standard error is a measure of sampling variability, that is, the variations that might occur by chance because only a sample of the population is surveyed. The chances are about 2 out of 3 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 19 out of 20 that the difference would be less than twice the standard error.

Table A shows the average standard error for the major employment status categories, by sex, computed from data for past months. Estimates of change derived from the survey are also subject to sampling variability. The standard error of change for consecutive months is also shown in table A. The standard errors of level shown in table A are acceptable approximations of the standard errors of year to year change.

| Employment status and sex | Average standard error of-- |  |
| :---: | :---: | :---: |
|  | Monthly level | Month-to-month change (consecutive months only) |
| BOTH SEXES |  |  |
| Labor force and total employment. | 250 | 180 |
| Agriculture. . . . . . . . . . . | 200 | 120 |
| Nonagricultural employment | 300 | 180 |
| Unemployment. . . . . . . . . | 100 | 100 |
| MALE |  |  |
| Labor force and total employment. | 120 | 90 |
| Agriculture. . . . . . . . . . . | 180 | 90 |
| Nonagricultural employment | 200 | 120 |
| Unemployment. . . . . . . . . | 75 | 90 |
| FEMALE |  |  |
| Labor force and total employment. | 180 | 150 |
| Agriculture. | 75 | 55 |
| Nonagricultural employment | 180 | 120 |
| Unemployment. . . . . . . . . | 65 | 65 |

The figures presented in table $B$ are to be used for other characteristics and are approximations of the standard errors of all such characteristics. They should be interpreted as providing an indication of the order of magnitude of the standard errors rather than as the precise standard error for any specific item.

The standard error of the change in an item from one month to the next month is more closely related to the standard error of the monthly level for that item than to the size of the specific month-to-month change itself. Thus, in order to use the approximations to the standard errors of month-to-month changes as presented in table C, it is first necessary to obtain the standard error of the monthly level of the item in table B, and then find the standard error of the month-to-month change in table $C$ corresponding to this standard error of level. It should be noted that table $C$ applies to estimates of change between 2 consecutive months. For changes between the current month and the same month last year, the standard errors of level shown in table $B$ are acceptable approximations.

Table B. Standasd error of level of monthly estimates
(In thousands)

| Size of estimate | Both sexes |  | Male |  | Female |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total or white | Nonwhite | Total or white | Nonwhite | Total or white | Nonwhite |
| 10 | 5 | 5 | 7 | 5 | 5 | 5 |
| 50 | 11 | 10 | 14 | 10 | 10 | 10 |
| 100 | 15 | 14 | 20 | 14 | 14 | 14 |
| 250 | 24 | 21 | 31 | 21 | 22 | 21 |
| 500 | 34 | 30 | 43 | 30 | 31 | 30 |
| 1,000 | 48 | 40 | 60 | 40 | 45 | 40 |
| 2,500. | 75 | 50 | 90 | 50 | 70 | 50 |
| 5,000 | 100 | 50 | 110 | . | 100 | . . |
| 10,000 | 140 | ... | 140 | . | 130 | . . |
| 20,000 | 180 | ... | 150 | . | 170 | . . . |
| 30,000 | 210 | ... | $\cdots$ | ... | . $\cdot$ | - . ${ }^{\text {a }}$ |
| 40,000 | 220 | . | -•• | . $\cdot$ | . . | $\cdots$ |

Illustration: Assume that the tables showed the total number of persons working a specific number of hours as $15,000,000$, an increase of 500,000 over the previous month. Linear interpolation in the first column of table B shows that the standard error of $15,000,000$ is about 160,000 . Consequently, the chances are about 68 out of 100 that the sample estimate differs by less than 160,000 from the figure which would have been obtained from a complete count of the number of persons working the given number of hours. Using the 160,000 as the standard
error of the monthly level in table C, it may be seen that the standard error of the 500,000 increase is about 135,000.

Table C. Standard error of estimates of month-to-month change
(In thousands)

| Standard error of monthly level | Standard error of month-to-month change |  |
| :---: | :---: | :---: |
|  | Estimates relating to agricultural employment | All estimates except those relating to agricultural employment |
| 10. | 14 | 12 |
| 25. | 35 | 26 |
| 50. | 70 | 48 |
| 100 | 100 | 90 |
| 150 | 110 | 130 |
| 200 | 250 | 160 |
| 250 | ... | 190 |
| 300 | -• | 220 |

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and
the size of the total upon which the percentage is based. Where the numerator is a subclass of the denominator, estimated percentages are relatively more rellable than the corresponding absolute estimates of the numerator of the percentage, particularly if the percentage is large ( 50 percent or greater). Table D shows the standard errors for percentages derived from the survey. Linear interpolation may be used for percentages and base figures not shown in table D .

Table D. Standard error of percentage

| Base of percentages (thousands) | Estimated percentage |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Establishment Data

## COLLECTION

Payroll reports provide current information on wage and salary employment, hours, earnings, and labor turnover in nonfarm establishments, by industry and geographic location.

## Federal-State Cooperation

Under cooperative arrangements with State agencies, the respondent fills out only one employment or labor turnover schedule, which is then used for national, State, and area estimates. This eliminates duplicate reporting on the part of respondents and, together with the use of identical techniques at the national and State levels, insures maximum comparability of estimates.

State agencies mall the forms to the establishments and examine the returns for consistency, accuracy, and completeness. The States use the information to prepare State and area series and then send the data to the BLS for use in preparing the national series.

## Shuttle Schedules

Two types of data collection schedules are used: Form BLS 790--Monthly Report on Employment, Payroll, and Hours; and Form DL 1219--Monthly Report
on Labor Turnover. These schedules are of the "shuttle" type, with space for each month of the calendar year. The schedule is returned to the respondent each month by the collecting agency so that the next month's data can be entered. This procedure assures maximum comparability and accuracy of reporting, since the respondent can see the figures he has reported for previous months.

The BLS 790 provides for entry of data on the number of full- and part-time workers on the payrolls of nonagricultural establishments and, for most industries, payroll and man-hours of production and related workers or nonsupervisory workers for the pay period which includes the 12th of the month. The labor turnover schedule provides for the collection of information on the total number of accessions and separations, by type, during the calendar month.

## CONCEPTS

## Industrial Classification

Establishments are classified into industries on the basis of their principal product or activity determined from information on annual sales volume. This information is collected each year on a supplement to the
monthly 790 or 1219 report. For an establishment making more than one product or engaging in more than one activity, the entire employment of the establishment is included under the industry indicated by the most important product or activity.

All national, State, and area employment, hours, earnings, and labor turnover serles are classifled in accordance with the Standard Industrial Classification Manual, Bureau of the Budget, 1957, as amended by the 1963 Supplement.

## Industry Employment

Employment data except that for the Federal Government refer to persons on establishment payrolls who received pay for any part of the pay period which includes the 12th of the month. For Federal Government establishments, employment tigures represent the number of persons who occupled positions on the last day of the calendar month. Intermittent workers are counted if they performed any service during the month.

The data exclude proprietors, the self-employed, unpaid family workers, farm workers, and domestic workers in households. Salaried officers of corporations are included, Government employment covers only civilian employees; Federal military personnel are excluded from total nonagricultural employment.

Persons on an establishment payroll who are on pald sick leave (when pay is received directly from the firm), on pald holiday or pald vacation, or who work during a part of the pay period and are unemployed or on strike during the rest of the pertod, are counted as employed. Not counted as employed are persons who are lald off, on leave without pay, or on strike for the entire period, or who are hired but do not report to work during the period.
Industry Hours and Earnings
Hours and earnings data are derived from reports of payrolls and man-hours for production and related workers in manufacturing and mining, construction workers in contract construction, and nonsupervisory employees in the remaining nonfarm components. For Federal Government, hours and earnings relate to all employees who worked or recelved pay during the pay period which includes the 12th of the month. Terms are defined below. When the pay period reported is longer than 1 week, figures are reduced to a weekly basis.

Production and related workers include working foremen and all nonsupervisory workers (including leadmen and trainees) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping, maintenance, repair, janitorial and watchman services, product development, auxiliary production for plant's own use (e.g., power plant), and recordkeeping and other services closely associated with the above production operations.

Construction woorkers include the following employees in the contract construction division: Working foremen, journeymen, mechanics, apprentices, laborers, etc.,
whether working at the site of construction or in shops or yards, at jobs (such as precutting and preassembling) ordinarily performed by members of the construction trades.

Nonsupervisory employees include employees (not above the working supervisory level) such as office and clerical workers, repairmen, salespersons, operators, drivers, attendants, service employees, linemen, laborers, janitors, watchmen, and similar occupational levels, and other employees whose services are closely assoclated with those of the employees listed.

Payroll covers the payroll for full- and part-time production, construction, or nonsupervisory workers who received pay for any part of the pay period which includes the 12 th of the month. The payroll is reported before deductions of any kind, e.g., for old-age and unemployment insurance, group insurance, withholding tax, bonds, or union dues; also included is pay for overtime, holidays, vacations, and sick leave paid directly by the firm. Bonuses (unless earned and paid regularly each pay period), other pay not earned in pay period reported (e.g., retroactive pay), and the value of free rent, fuel, meals, or other payment in kind are excluded.

Man-hours cover man-hours worked or paid for, during the pay period which includes the 12 th of the month, for production, construction, or nonsupervisory workers. The man-hours include hours pald for holidays and vacations, and for sick leave when pay is received directly from the flrm.

Overtime hours cover premium overtime hours of production and related workers during the pay period which includes the 12th of the month. Overtime hours are those for which premiums were pald because the hours were in excess of the number of hours of elther the stralght-time workday or workweek. Weekend and holiday hours are included only if premium wage rates were pald. Hours for which only shift differentiai, hazard, incentive, or other similar types of premiums were paid are excluded.

## Gross Average Hourly and Weekly Eamings

Average hourly earnings are on a "gross" basis, reflecting not only changes in basic hourly and incentive wage rates, but also such variable factors as premium pay for overtime and late-shift work, and changes in output of workers patd on an Incentive plan. Shifts in the volume of employment between relatively high-paid and low-paid work and changes in workers' earnings in individual establishments also affect the general earnings averages. Averages for groups and divisions further reflect changes in average hourly earninge for individual industries.

Averages of hourly earninge differ from wage rates, Earnings are the actual return to the worker for a stated period of time, while rates are the amounts stipulated for a given unit of work or time. The earnings sertes, however, does not measure the level of total labor costs on
the part of the employer since the following are excluded: Irregular bonuses, retroactive items, payments of various welfare benefits, payroll taxes paid by employers, and earnings for those employees not covered under the pro-duction-worker, construction worker, or nonsupervisoryemployee definitions.

Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings. Therefore, weekly earnings are affected not only by changes in gross average hourly earnings, but also by changes in the length of the workweek, part-time work, stoppages for varying causes, labor turnover, and absenteeism.

## Average Weekly Hours

The workweek information relates to the average hours for which pay was received, and is different from standard or scheduled hours. Such factors as absenteeism, labor turnover, part-time work, and stoppages cause average weekly hours to be lower than scheduled hours of work for an establishment. Group averages further reflect changes in the workweek of component industries.

## Average Overtime Hours

The overtime hours represent that portion of the gross average weekly hours which were in excess of regular hours and for which premium payments were made. If an employee worked on a paid holiday at regular rates, receiving as total compensation his holiday pay plus straight-time pay for hours worked that day, no overtime hours would be reported.

Since overtime hours are premium hours by definition, gross weekly hours and overtime hours do not necessarily move in the same direction, from month-tomonth; for example, premiums may be paid for hours in excess of the straight-time workday although less than a full week is worked. Diverse trends at the industrygroup level may also be caused by a marked change in gross hours for a component industry where little or no overtime was worked in both the previous and current months. In addition, such factors as stoppages, absenteeism, and labor turnover may not have the same influence on overtime hours as on gross hours.

## Railroad Hours and Eamings

The figures for class I railroads (excluding switching and terminal companies) are based on monthly data summarized in the M-300 report of the Interstate Commerce Commission and relate to all employees who received pay during the month, except executives, officials, and staff assistants (ICC group I). Gross average hourly earnings are computed by dividing total compensation by total hours paid for. Average weekly hours are obtained by dividing the total number of hours paid for reduced to a weekly basis, by the number of employees, as defined above. Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings.

## Spendable Average Weekly Earnings

Spendable average weekly earnings in current dollars are obtained by deducting estimated Federal social security and income taxes from gross weekly earnings. The amount of income tax liability depends on the number of dependents supported by the worker and his marital status, as well as on the level of his gross income. To reflect these variables, spendable earnings are computed for a worker with no dependents, and a married worker with three dependents. The computations are based on the gross average weekly earnings for all production or nonsupervisory workers in the industry division without regard to total family income.
"Real" earnings are computed by dividing the current Consumer Price Index into the earnings averages for the current month. The level of earnings is thus adjusted for changes in purchasing power since the base period (1957-59).

## Average Hourly Earmings Excluding Overtime

Average hourly earnings excluding premium overtime pay are computed by dividing the total productionworker payroll for the industry group by the sum of total production-worker man-hours and one-half of total overtime man-hours. Prior to January 1956, these data were based on the application of adjustment factors to gross average hourly earnings (as described in the Monthly Labor Review, May 1950, pp. 537-540). Both methods eliminate only the earnings due to overtime paid for at $1 \frac{1}{2}$ times the straight-time rates. No adjustment is made for other premium payment provisions, such as holiday work, late-shift work, and overtime rates other than time and one-half.

## Indexes of Aggregate Weekly Payrolls and Man-Hours

The indexes of aggregate weekly payrolls and manhours are prepared by dividing the current month's aggregate by the monthly average for the 1957-59 period. The man-hour aggregates are the product of average weekly hours and production-worker employment, and the payroll aggregates are the product of gross average weekly earnings and production-worker employment.

## Labor Turnover

Labor turnover is the gross movement of wage and salary workers into and out of employed status with respect to individual establishments. This movement, which relates to a calendar month, is divided into two broad types: Accessions (new hires and rehires) and separations (terminations of employment initiated by either employer or employee). Each type of action is cumulated for a calendar month and expressed as a rate per 100 employees. The data relate to all employees, whether full- or part-time, permanent or temporary, including executive, office, sales, other salaried personnel, and production workers. Transfers to another establishment of the company are included, beginning with January 1959.

Accessions are the total number of permanent and temporary additions to the employment roll, including both new and rehired employees.

New hires are temporary or permanent additions to the employment roll of persons who have never before been employed in the establishment (except employees transferring from another establishment of the same company) or of former employees not recalled by the employer.

Other accessions, which are not published separately but are included in total accessions, are all additions to the employment roll which are not classified as new hires, including transfers from another establishment of the company.

Separations are terminations of employment during the calendar month and are classified according to cause: Quits, layoffs, and other separations, are defined as follows:

Quits are terminations of employment initiated by employees, failure to report after being hired, and unauthorized absences, if on the last day of the month the person has been absent more than 7 consecutive calendar days.

Layoffs are suspensions without pay lasting or expected to last more than 7 consecutive calendar days, initiated by the employer without prejudice to the worker.

Other separations, which are not published separately but are included in total separations, are terminations of employment because of discharge, permanent disability, death, retirement, transfers to another estabishment of the company, and entrance into the Armed Forces for a period expected to last more than 30 consecutive calendar days.

## Comparability With Employment Series

Month-to-month changes in total employment in manufacturing industries reflected by labor turnover rates are not comparable with the changes shown in the Bureau's employment series for the following reasons: (1) Accessions and separations are computed for the entire calendar month; the employment reports refer to the pay period which includes the 12th of the month; and (2) employees on strike are not counted as turnover actions although such employees are excluded from the employment estimates if the work stoppage extends through the report period.

## ESTIMATING METHODS

The principal features of the procedure used to estimate employment for the industry statistics are (1) the use of the "link relative" technique, which is a form of
ratio estimation, and (2) periodic adjustment of employment levels to new benchmarks, and (3) the use of size and regional stratification.

## The "Link Relative" Technique

From a sample composed of establishments reporting for both the previous and current months, the ratio of current month employment to that of the previous month is computed. This is called a link relative. The estimates of employment (all employees, including production and nonproduction workers together) for the current month are obtained by multiplying the estimates for the previous month by these "link relatives." Other features of the general procedures are described later in the table, Summary of Methods for Computing Industry Statistics on Employment, Hours, Earnings, and Labor Turnover. Further details are given in the technical notes on Measurement of Employment, Hours, and Eamings in Nonagricultural Industries and on Measuremnt of Labor Tumover, which are available upon request.

## Size and Regional Stratification

A number of industries are stratified by size of establishment and/or by region, and the stratified produc-tion- or nonsupervisory-worker data are used to weight the hours and earnings into broader industry groupings. Accordingly, the basic estimating cell for an employment, hours, or earnings series, as the term is used in the summary of computational methods may be a whole industry or a size stratum, a region stratum, or a size stratum of a region within an industry.

## Benchmark Adiustments

Employment estimates are periodically compared with comprehensive counts of employment which provide "benchmarks" for the various nonagricultural industries, and appropriate adjustments are made as indicated. The industry estimates are currently projected from March 1965 levels. Normally, benchmark adjustments are made annually.

The primary source of benchmark information is the employment data, by industry, compiled quarterly by State agencies from reports of establishments covered under State unemployment insurance laws. These tabulations, covering three-fourths of the total nonfarm employment in the United States, are prepared under the direction of the Bureau of Employment Security. Benchmark data for the residual are obtained from the records of the Social Security Administration, the Interstate Commerce Commission, and a number of other agencies in private industry or government.

The estimates relating to the benchmark month are compared with new benchmark levels, industry by industry. If revisions are necessary, the monthly series of estimates are adjusted between the new benchmark and the preceding one, and the new benchmark for each industry is then carried forward progressively to the current month by use of the sample trends. Thus, under
this procedure, the benchmark is used to establish the level of employment, while the sample is used to measure the month-to-month changes in the level.

Data for all months since the last benchmark to which the series has been adjusted are therefore subject to revision. To provide users of the data with a convenient reference source for the revised data, the BLS publishes as soon as possible after each benchmark revision a summary volume of employment, hours, earnings, and labor turnover statistics.

## THE SAMPLE

## Design

The sampling plan used in the current employment statistics program is an optimum allocation design known as "sampling proportionate to average size of establishment." The universe of establishments is stratified first by industry and then within each industry by size of establishment in terms of employment. For each industry the toral size of sample is distributed among the size class cells on the basis of average employment per establishment in each cell. In practice, this is equivalent to distributing the predetermined total number of establishments required in the sample among the ceils on the basis of the ratio of employment in each cell to total employment in the industry. Within each stratum the sample members are selected at random.

Under this type of design, large establishments fall into the sample with certainty. The size of the samples for the various industries is determined empirically on the basis of experience and of cost considerations, In a manufacturing industry in which a high proportion of total employment is concentrated in a relatively few establishments, a large percentage of total employment is included in the sample. Consequently, the sample design for such industries provides for a complete census of the larger establishments with only a few chosen from among the smaller establishments or none at all if the concentration of employment is great enough. On the other hand, in an industry in which a large proportion of total employment is in small establishments, the sample design calls for inclusion of all large establishments, and also for a substantial number of the smaller ones. Many industries in the trade and service divisions fall into this category. In order to keep the sample to a size which can be handled by available resources, it is necessary to accept samples in these divisions with a smaller proportion of universe employment than is the case for most manufacturing industries. Since individual establishments in these nonmanufacturing divisions generally show less fluctuation from regular cyclical or seasonal patterns than establishments in manufacturing industries, these smaller samples (in terms of employment) generally produce reliable estimates.

In the context of the BLS employment and labor turnover statistics programs, with their emphasis on pro-
ducing timely data at minimum cost, a sample must be obtained which will provide coverage of a sufficiently large segment of the universe to provide reasonably reliable estimates that can be published promptly and regularly. The present sample meets these specifications for most industries. With its use, the BLS is able to produce preliminary estimates each month for many industries and for many geographic levels within a few weeks after reports are mailed by respondents, and at a somewhat later date, statistics in considerably greater industrial detail. The tendency of such a sample to produce biased estimates of the level of earnings for certain industries is counteracted by the stratified estimating procedure described under "Estimating Methods."

## Coverage

The BLS sample of establishment employment and payrolls is the largest monthly sampling operation in the field of social statistics. The table that follows shows the approximate proportion of total employment in each industry division covered by the group of establishments furnishing monthly employment data. The coverage for individual industries within the division may vary from the proportions shown.

Approximate size and coverage of BLS employment and payrolls sample, March $1965^{1}$

| Industry division | Employees |  |
| :---: | :---: | :---: |
|  | Number reported | Percent of total |
| Mining | 287,000 | 46 |
| Contract construction | 620,000 | 22 |
| Manufacturing | 11,338,000 | 64 |
| Transportation and public utilities: |  |  |
| Railroad transportation (ICC) | 697,000 | 96 |
| Other transportation and public utilities. . . . . . . | 1,740,000 | 54 |
| Wholesale and retail trade. | 2,403,000 | 20 |
| Finance, insurance and real estate. | 1,030,100 | 35 |
| Service and miscellaneous | 1,682,000 | 19 |
| Government: |  |  |
| Federal (Civil Service |  |  |
| Commission) ${ }^{2} . . .$. | 2,326,000 | 100 |
| State and local | 3,980,000 | 52 |

${ }^{1}$ Since a few establishments do not report payroll and man-hour information, hours and earnings estimates may be based on a slightly smaller sample than employment estimates.

2 State and area estimates of Federal employment are based on reports from a sample of Federal establishments, collected through the BLS-State cooperative program.

The table below shows the approximate coverage, in terms of employment, of the labor turnover sample.

| Approximate size and coverage of BLS labor turnover <br> sample, March $\mathbf{1 9 6 5}$ |  |  |
| :--- | :---: | :---: |
| Industry | Employees |  |
|  | Number <br> reported | Percent <br> of total |
|  | $10,809,200$ | 61 |
| Metal mining. . . . . . | 65,800 | 80 |
| Coal mining. . . . . . | 61,600 | 43 |
| Communication: |  |  |
| Telephone . . . . . . | 579,200 | 80 |
| Telegraph . . . . . . | 21,600 | 68 |

## Reliobility of the Employment Estimates

The estimates derived from the establishment survey may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures. The relatively large size of the BLS establishment sample assures a very high degree of accuracy. Therefore, sampling variability as expressed in standard errors of the estimate is of little consequence, particularly with respect to month-to-month changes. However, since the use of the link relative technique requires the use of the previous month's estimate as the base in computing the current month's estimate, small sampling and response errors may cumulate over several months. To remove this accumulated error, the estimates are adjusted to new benchmarks annually. In addition to the sampling and response errors, the benchmark revision adjusts the estimates for changes in the industrial classification of individual establishments (resulting from changes in their product which are not reflected in the levels of estimates until the data are adjusted to new benchmarks.) In fact, at the more detailed industry levels, particularly within manufacturing, changes in classification are the major cause of benchmark adjustments. Another cause of differences, generally minor, arises from improvements in the quality of the benchmark data. (A detailed description of the March 1965 benchmark is available from the Bureau upon request.)

The entire difference between the estimate and benchmarks is assumed to have accumulated at a regular rate. Accordingly, the all employee series, for months between the current and the last preceding benchmark, are adjusted by tapering out the difference back from the current benchmark to the last previous benchmark. The series for months subsequent to the benchmark month are revised by projecting the level of the new benchmark by the trend of the unadjusted series.

For the most recent months, national, State, and area estimates are preliminary and are so footnoted in the tables. These figures are based on less than the total sample and are revised when all the reports in the sample design have been received.

An approximation of the standard deviations (based on the experience of the last several years) of revisions between (1) final estimates and benchmarks, and (2) preliminary and final estimates, are presented in the following table. The chances are about 2 out of 3 that the revisions will be less than the amount indicated for each size of estimate. The chances are about 19 out of 20 that the revisions will be less than twice the amount indicated.

Average standard deviation of revisions between final estimates and benchmarks and between preliminary and final estimates

| Size of empl. estimate | Standard deviations of revisions |  |
| :---: | :---: | :---: |
|  | Final ${ }^{1}$ | Preliminary |
| 50,000. | 2,000 | 600 |
| 100,000. | 2,500 | 900 |
| 200,000. | 4,000 | 1,300 |
| 500,000. | 7,500 | 2,400 |
| 1,000,000. | 12,000 | 4,100 |

${ }^{1}$ Assuming 12 -month intervals between benchmark revisions.

A comparison of the actual amounts of revisions made in the last 3 benchmark years follows:

Nonagricultural payroll employment estimates, by industry division, as a percentage of the benchmark for 1963-65

| Industry division | 1963 | 1964 | 1965 |
| :---: | ---: | ---: | ---: |
| Total . . . . . . . . . . . . . . . . . | 101.0 | 100.0 | 99.5 |
| Mining . . . . . . . . . . . . . . . | 100.3 | 100.0 | 99.5 |
| Contract construction . . . . . . | 101.5 | 101.5 | 100.9 |
| Manufacturing . . . . . . . . . . . | 100.1 | 100.2 | 99.8 |
| Transportation and public |  |  |  |
| utilities . . . . . . . . . . . . | 100.0 | 100.4 | 100.1 |
| Wholesale and retail trade . . . . | 100.6 | 100.4 | 99.4 |
| Finance, insurance, and |  |  |  |
| real estate . . . . . . . . . . . . | 99.8 | 99.4 | 100.7 |
| Service and miscellaneous . . . | 100.8 | 99.7 | 97.9 |
| Government. . . . . . . . . . . . . . | 103.8 | 99.0 | 99.8 |

## STATISTICS FOR STATES AND AREAS

State and area employment, hours; earnings, and labor turnover data are collected and prepared by State agencies in cooperation with BLS. The area statistics relate to metropolitan areas. Definitions for all areas are published each year in the issue of Employment and Earnings and Monthly Report on the Labor Force that contains State and area annual averages. Changes in definitions are noted as they occur. Additional industry detail may be obtained from the State agencies listed on the inside back cover of each issue. These statistics are based on the same establishment reports used by

BLS for preparing national estimates. For employment, the sum of the State figures may differ slightly from the equivalent official U.S. totals on a national basis, because some States have more recent benchmarks than others and because of the effects of differing industrial and geographic stratification.

For the States and the areas shown in the B and C sections of this periodical, all the annual average data for the detailed industry statistics currently published by each cooperating State agency are presented (from the earliest data of availability of each series) in a summary volume published annually by the Bureau of Labor Statistics.

## UNEMPLOYMENT INSURANCE DATA

Insured unemployment represents the number of persons reporting a week of unemployment under an unemployment insurance program. It includes some persons who are working part time who would be counted as employed in the payroll and household surveys. Excluded are persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (agriculture, State and local government, domestic service, self-employment, unpaid family work, nonprofit organizations, and firms below a minimum size). The rate of insured unemployment is the number of insured unemployed expressed as a percent of average covered employment in a 12 -month period ending 6 to 8 months prior to the week of reference. Initial
claims are notices filed by those losing jobs covered by an unemployment insurance program that they are starting a period of unemployment. A claimant who continues to be unemployed a full week is then counted in the insured, unemployment figure.

Because of differences in State laws and procedures under which unemployment insurance programs are operated, Staie unemployment rates generally indicate, but do not precisely measure, differences among the individual States. Persons wishing to receive a detailed description of the nature, sources, inclusions and exclusions, and limitations of unemployment insurance data should address their inquiries to Bureau of Employment Security, Washington, D.C.

## SEASONAL ADJUSTMENT

Many economic statistics reflect a regularly recurring seasonal movement which can be estinated on the basis of past experience. By eliminating that part of the change which can be ascribed to usual seasonal variation, it is possible to observe the cyclical and other nonseasonal movements in the series. However, in evaluating deviations from the seasonal pattern-that is, changes in a seasonally adjusted series--it is important to note that seasonal adjustment is merely an approximation based on past experience. Seasonally adjusted estimates have a broader margin of possible error than the original data on which they are based, since they are subject not only to sampling and other errors but, in addition, are affected by the uncertainties of the seasonal adjustment process itself. Seasonally adjusted series for selected labor force and establishment data are published regularly in Employment and Earnings and Monthly Report on the Labor Force.

The seasonal adjustment method used for these series is an adaptation of the standard ratio-to-moving average method, with a provision for "moving" adjustment factors to take account of changing seasonal patterns. A detailed description of the method is given in the booklet, The BLS Seasonal Factor Method (1966), which may be obtained from the Bureau on request. An earlier version of the method is described in Appendix G of the 1962 Report of the President's Committee to Appraise Employment and Unemployment Statistics, Measuring Employment and Unemployment.

For establishment data, the seasonally adjusted series on weekly nours and labor turnover rates for industry groupings are computed by applying factors
directly to the corresponding unadjusted series, but seasonally adjusted employment totals for all employees and production workers by industry divisions are obtained by summing the seasonally adjusted data which are published for component industries. Indexes of aggregate weekly man-hours seasonally adjusted, for mining, contract construction, and the major industries in manufacturing are obtained by multiplying average weekly hours, seasonally adjusted, by production workers, seasonally adjusted and dividing by the 1957-59 base. For total, manufacturing, and durable and nondurable goods, the indexes of aggregate weekly man-hours, seasonally adjusted, are obtained by summing the aggregate weekly man-hours, seasonally adjusted, for the appropriate component industries and dividing by the 1957-59 base.

The seasonally adjusted establishment data for Federal Government are based on a series which excludes the Christmas temporary help employed by the Post Office Department in December. The employment of these workers constitutes the only significant seasonal change in Federal Government employment during the winter months. Furthermore, the volume of such employment may change substantially from year to year because of administrative decisions by the Post Office Department. Hence, it was considered desirable to exclude this group from the data upon which the seasonally adjusted series is based. Factors currently in use for the establishment data are shown in the September 1966 Employment and Earnings and Monthly Report on the Labor Force, and revisions will be made coincidental with the adjustment of series to new benchmark levels.

For each of the three major labor force components-agricultural and nonagricultural employment, and unem-ployment--data for four age-sex groups (male and female workers under age 20 , and age 20 and over) are separately adjusted for seasonal variation and are then added to give seasonally adjusted total figures. In order to produce seasonally adjusted total employment and civilian labor force data, the appropriate series are aggregated. The seasonally adjusted rate of unemployment is derived by dividing the seasonally adjusted figure for total unemployment (the sum of four seasonally adjusted age-sex components) by the figure for the
seasonally adjusted civilian labor force (the sum of twelve seasonally adjusted age-sex components).

The seasonal adjustment factors applying to current data are based on a pattern shown by past experience. These factors are revised in the light of the pattern revealed by subsequent data. Revised seasonally adjusted series for major components of the labor force based on data through December 1965 are published in the February 1966 Employment and Earnings and Monthly Report on the LaborForce. Revisions will be made annually as each additional year's data become available.
on Emplayment, Hours, Earnings, and Labar Turnaver

| Item | Basic estimating cells (industry, region, size, or region/size cell) | Aggrégate industry levels (divisions, groups and, where stratified, individual cells) |
| :---: | :---: | :---: |
|  | Manthly Data |  |
| All employees | All-employee estimate for preyious month multiplied by ratio of all employees in current month to all employees in previous month, for sample establishments which reported for both months. | Sum of all-employee estimates for component cells. |
| Production or nonsupervisory workers; women employees. | All-employee estimate for curtent month multiplied by (1) ratio of production or nonsupervisory workers to all employees in sample establishments for current monch, (2) ratio of women to all employees. | Sum of production- or nonsupervisory-worker estimates, or estimates of women employees, for component cells. |
| Gross average weekly hours | Pruduction- or nonsupervisory-worker man-hours divided by number of production or nonsupervisory workers. | Average, weighted ty production- or nonsuper-visory-worker employment, of the average weekly hours for component cells. |
| Average weekly overtime hours. | Production-worker overtime man-hours divided by number of production workers. | Average, weighted by production-worker employment, of the average weekly overtime hours for component cells. |
| Gross a verage hourly earnings | Total production- or nonsupervisory-worker payroll divided by total production- or nonsuper-visory-worker man-hours. | Average, weighted by aggregate man-hours, of the average hourly earnings for component cells. |
| Gross average weekly eamings. . | Product of gross average weekly hours and average hourly earaings. | Product of gross average weekly hours and average hourly earnings. |
| Labor turnover rates (total, men, and women). | The number of particular actions (e.g., quits) in reporting firms divided by total employment in those firms. The result is multiplied by 100. For men (or women), the number of men (women) who quit is divided by the total number of men (women) employed. | Average, weighted by employment, of the rates for component cells. |
|  | Annual Average Dato |  |
| All employees and production or nonsupervisory workers. | Sum of monthly estimates divided by 12. | Sum of monthly estimates divided by 12. |
| Gross average weekly hours | Annual total of aggregate man-hours (productionor nonsupervisory-worker employment multiplied by average weekly hours) divided by annual sum of employment. | Annual total of aggregate man-hours for production or nonsupervisory workers divided by annual sum of employment for these workers. |
| Average weekly overime hours | Annual total of aggregate overtime man-hours (production-worker employment multiplied by average weekly overtime hours) divided by annual sum of employment. | Ansual total of aggregate overtime man-hours for production workers divided by annual sum of employment for these workers. |
| Gross average hourly earnings | Annual total of aggregate payrolls (productionor nonsupervisory-worker employment multiplied by weekly earnings) divided by annual aggregate man-hours. | Annual total of aggregate payrolls divided by anoual aggregate man-hours. |
| Grosa average weekly eamings | Product of gross average weekly hours and average hourly earnings. | Product of gross average weekly hours and average hourly earaings. |
| Labor turnover rates . . | Sum of moathly rates divided by 12. | Sum of monthly rates divided by 12 . |

[^0]:    ${ }^{1}$ Quarterly data included in February, May, August, and November issues.

[^1]:    ＊Of the Division of Employment and Unemployment Analysis，Bureau of Labor Statistics。
    ${ }^{1}$ Levels and year－to－year changes cited in this article are annual averages unless otherwise specified．

[^2]:    ${ }^{2}$ The nonfarm industry employment figures are based on establishment reports of the number of employees on payrolls.

[^3]:    ${ }^{3}$ The data for nonwhite workers can be used to represent the situation for Negroes since they comprise 92 percent of all nonwhite workers.

[^4]:    ${ }^{4}$ Labor force participation rates for white and nonwhite workers are based on the civilian noninstitutional population, excluding the Armed Forces.

[^5]:    ${ }^{1}$ Employed persons with a job but not at work are distributed proportionately among the full-and part-time employed categories.

[^6]:    See footnotes at end of table. NOTE: Data for the $\mathbf{2}$ most recent months are preliminary.

[^7]:    See footnotes at end of cable. NOTE: Data for the $\mathbf{2}$ most recent months are preliminary.

[^8]:    See footnotes at end of table. NOTE: Data for the 2 most recent months are preliminary.

[^9]:    See footnotes at end of table. NOTE: Data for the 2 most recent months are preliminary.

[^10]:    See foomotes at end of cable. NOTE: Data for the 2 most fecent months are preliminary

[^11]:    See footnotes at end of table. NOTE: Data for the current month are prellminary.

[^12]:    See footnotes at end of table. NOTE: Data for the current month are prellminary.

[^13]:    See foomotes at end of table. NOTE: Data for the $\mathbf{2}$ most recent months are preliminary.

[^14]:    See footnotes at end of table. NOTE: Data for the 2 most recent months are preliminary.

[^15]:    See foomotes at end of table. NOTE: Data for the 2 most recent mondhs are preliminary.

[^16]:    See foomotes at end of table. NOTE: Date for the $\mathbf{2}$ most recent montha are prelininary.

[^17]:    See footnotes at end of table. NOTE: Data for the 2 most recent months are preliminary.

[^18]:    See foomotes at end of cable. NOTE: Dats for the $\mathbf{2}$ most receat months are preliminary.

[^19]:    See footnotes at end of table. NOTE: Data for the 2 most recent months are preliminary.

[^20]:    ${ }^{\prime}$ For mining and menufncturing, date refer to production and relered workers; for coatract construction, to construction workers; and for wholesale and rewil trade, to nonsupervisory workers.

[^21]:    TFor mining and manufacturing, data refer to production and related workers; for codtract construction, date relaxe co conatruction vorkers.

[^22]:    See footnotes at end of table. NOTE: Data for the current month are preliminary.

[^23]:    See foomotes at end of table. NOTE: Data for the current month are preliminary

[^24]:    $\mathbf{1}_{\text {Beginning with }}$ January 1959, transfers berween establishments of the same firm are included in total accessions and total separations, therefore zates for these items are not strictly comparable with prior data. Transfers comprise part of other accessions and other separations, the cates for which are not shown separately.

    NOTE: Data include Alaska and Hawaii beginning 1959. This inclusion has not significantly affected the labor turnover series.
    Data for the cursent ronth are preliminary.

[^25]:    ${ }^{1}$ Includes forestry and fisheries, mining and public administration, not shown separately.
