## Highlights

For a review of labor force, employment, and unemployment developments during 1968, see article beginning on page 12.

The latest developments on the employment situation of persons living in urban poverty neighborhoods are discussed on pages 6-11.

SECTION D-LABOR TURNOVER - ESTABLISHMENT DATA

110 E-1: Insured unemployment under State programs
111 E-2: Insured unemployment in 150 major labor areas
${ }^{1}$ Quarterly data included in February, May, August, and November issues.

Employment continued to rise substantially in December while unemployment remained at post-Korean lows.

Unemployment rates declined slightly for adult men, married men, Negroes, and full-time workers, although the overall unemployment rate, at 3.3 percent, was unchanged over the month at the 15 -year low reached in November. The jobless rate for workers covered under State unemployment insurance programs moved down to 2.0 percent, setting a post-World War II record low. For 1968 as a whole, the unemployment rate for all workers averaged 3.6 percent, the lowest annual rate since the Korean war period.

## Industry Employment

Nonfarm payroll employment rose 460,000 in December to a record 70.0 million. The December increase was 265,000 more than seasonally expected and represented the third consecutive month of substantial gains. In the last 3 months, nonfarm payroll employment has risen 800,000 (seasonally adjusted). About 30,000 of the December increase was due to the net return of workers who were off payrolls in November because of strikes.

Nearly all major industry divisions shared in the employment advance in December. Contract construction and State and local government had seasonally adjusted employment gains of 80,000 each, while manufacturing and services each increased 60,000 . The job gains in manufacturing were fairly widespread and were led by increases in transportation equipment, fabricated metals, apparel, primary metals, and rubber. More than half of the 80,000 increase in State and local government was due to the return to payrolls of teachers in New York City who had been on strike.

Employment in transportation and public utilities and trade declined over the month on a seasonally adjusted basis. The 25,000 drop in transportation and public utilities was due mainly
to increased strike activity. The decline in trade resulted from a less-than-usual Christmas employment pickup, as retail sales were affected by the flu.

## Hours and Earnings

Average weekly hours for rank and file workers on private payrolls edged up 0.1 hour in December to 37.6 hours (seasonally adjusted). The increase resulted primarily from a sharp rise in the workweek in contract construction, which reflected both increased building activity and a pickup from the large drop in November when the weather was unusually bad.

In manufacturing, the workweek in December was down one-tenth of an hour to 40.7 hours (seasonally adjusted). December was the third consecutive month in which the factory workweek had declined. Over the year, however, there has been no change in average weekly hours in manufacturing.

Average hourly earnings rose 1 cent in December to $\$ 2.93$ for rank and file workers. Average weekly earnings advanced $\$ 1.25$ over the month to $\$ 110.75$, with the largest gain-$\$ 10-$-occurring in construction.

## Unemployment

The number of unemployed persons was 2.4 million in December, a decrease of 150,000 over the month. Unemployment among adult men declined on a seasonally adjusted basis in December; their unemployment rate edged down 0.2 percentage point to 1.8 percent--the lowest rate since the series began in 1948.

Reflecting the strong job market situation for adult men, jobless rates for both married men and full-time workers also declined in December to 1.4 and 2.7 percent, respectively. Unemployment rates for adult women ( 3.5 percent) and teenagers ( 12.6 percent) were not significantly changed over the month.

The jobless rate for nonwhite workers showed some improvement in December. At 6.0 percent, the rate was down from 6.5 percent in November and was the lowest rate since 1953. At 2.9 percent, the white rate also reached a new postKorean low.

## Total Employment and Labor Force

Total employment, at 76.7 million in December, was 100,000 more than in November. After seasonal adjustement, the employment gain amounted to 475,000 , dominated by an increase of 400,000 for adult men. Teenage employment remained virtually unchanged in December.

For the second month in succession, employment in agriculture declined much less than
seasonally expected. Seasonally adjusted agricultural employment rose by 200,000 in both November and December, after declining steadily since February. Good weather throughout most of the Nation during the survey week and a late harvest of citrus fruit and nut crops were probably responsible for the less-than-usual employment drops.

The December rise in nonagricultural employment ( 300,000 seasonally adjusted) was the fourth straight monthly advance. The increase occurred entirely among adult men.

At 79.1 million in December, the civilian labor force declined 425,000 less than seasonally expected. Adult men accounted for the bulk of the increase on a seasonally adjusted basis.

The Employment Situation in Urban Poverty<br>Neighborhoods, Fourth Quarter 1968

Unemployment rates in poverty neighborhoods of the Nation's 100 largest metropolitan areas declined sharply between the fourth quarters of 1967 and 1968. The unemployment rate fell from 6.9 percent in the fourth quarter of 1967 to 5.2 percent in the fourth quarter of 1968. The improvement in these poverty neighborhoods occurred at a faster rate than in the other neighborhoods of the 100 areas or in the Nation as a whole.

Unemployment rates for adult men, adult women, and teenagers from urban poverty neighborhoods were all lower in the fourth quarter of 1968 than a year earlier. The declines in the jobless rates for adult men ( 4.9 to 3.7 percent), and for teenagers ( 24.3 to 19.2 percent) were relatively greater than for their counterparts in the remaining neighborhoods of the 100 largest metropolitan areas. The drop in the rate for adult women ( 5.9 to 4.7 percent) from poverty neighborhoods was only slightly greater than that for adult women in other urban neighborhoods. Unemployment rates for these groups, however, remained higher in poverty neighborhoods.

The decline in joblessness occurred for both white and Negro workers. The unemployment rate for Negroes was reduced from 9.0 percent to 6.4 percent, while the white rate fell from 5.4 to 4.4 percent. Lower jobless rates were reported for both white and Negro adult men in the fourth quarter of 1968. Among adult women, however, all of the improvement was among Negroes, as their rate fell from 7.2 to 4.9 percent. For both white and Negro teenagers from poverty neighborhoods, jobless rates were considerably improved over the year. In the other urban neighborhoods, the teenage rates were little changed.

The decline in the jobless level for urban poverty residents was accompanied by a decline in the population, labor force, and employment in these areas. A relatively faster reduction in unemployment, however, was responsible for the drop in the jobless rate.

## 1968 In Review $1 /$

The employment situation for workers in these urban poverty neighborhoods improved in 1968. At 6.0 percent, the unemployment rate in poverty

1/ This discussion is based on 12-month averages of labor forces estimates for 1967 and 1968. Annual averages for 1967 may not be exactly comparable with those for 1968 because first quarter 1967 levels and rates of unemployment maỳ have been overstated. The Current Population Survey requires several months of continuous data before the necessary statistical techniques exert their fulleffect, and the first quarter of 1967 was the first period for which data were available. However, comparisons of the data for the 2 years do provide a general indication of changes in the employment situation in these urban poverty neighborhoods. A more comprehensive analysis of 1968 developments in urban poverty neighborhoods is expected to appear in the February 1969 issue of Employment and Earnings and Monthly Report on the Labor Force.

NOTE: The poverty neighborhood classification used in this report was developed by the Bureau of the Census and is based on a ranking of census tracts according to 1960 data on income, education, skills, housing, and proportion of broken families. The poorest one-fifth of these tracts in the Nation's 100 largest metropolitan areas are considered poverty neighborhoods. The poverty neighborhood statistics probably include some middle- and upper-income families and also exclude some poor families who live in other urban neighborhoods. In 1967, for example, only about one-third of the nonwhite families living in poverty neighborhoods had incomes below the poverty level as defined by the Social Security Administration. These data, therefore, do not represent the exact dimensions of the employment problems of all poor people but are instead minimal estimates of the adverse conditions of residents in these specific poverty neighborhoods.
neighborhoods was down from 6.8 percent a year earlier but was substantially higher than the $\mathrm{Na}-$ tion's rate of 3.6 percent. Unemployment rates for men, women, and teenagers were all significantly lower than in 1967. Negro workers accounted for nearly all of the reduction in unemployment in these poverty neighborhoods.

The pace of improvement in the poverty neighborhoods in 1968 was only somewhat faster than that occurring in other urban neighborhoods and the total United States. Continued economic growth and the many programs aimed at the disadvantaged have assisted in reducing joblessness in poverty neighborhoods, but the unemployment gap between the fortunate and less fortunate was still clearly evident in 1968.

Unemployment. Unemployment in these poverty neighborhoods of the Nation's 100 largest cities averaged 375,000 in 1968 compared to 450,000 in 1967. The unemployment level represented 13.7 percent of all unemoloyment in the Nation; in 1967 , it accounted for 15.2 percent of the total unemployed.

Rates of unemployment for adult men, adult women, and teenagers all improved over the year, as the poverty neighborhood rate dropped from 6.8 to 6.0 percent. The jobless rate for adult men, at 4.2 percent in 1968 , was down by 0.5 percentage point from 1967. Despite this improvement, the jobless rate for adult men in poverty neighborhoods in 1968 continued to be 2.3 times as large as the rate for men from other urban neighborhoods. This was the largest differential among all the major age-sex groups.

The rate for adult women in poverty neighborhoods improved about as much as the rate for their counterparts in other unban neighborhoods. Their rate averaged 5.5 percent, down from 6.1
percent a year earlier but still about 1.7 times as high as the rate for women from other urban neighborhoods.

While the unemployment rate for teenagers from other urban neighborhoods was unchanged over the year, the rate for teenagers from these poverty neighborhoods declined from 23.5 to 20.0 percent. Although their rate continues to be high, the gap between the rates for teenagers from the poverty neighborhoods and other urban neighborhoods has narrowed.

Negroes and Whites. Negro workers accounted for most of the 70,000 decline in unemployment in these urban poverty neighborhoods. Their jobless rate dropped from 8.9 to 7.3 percent, narrowing the gap between their rate and the rate for white workers, which was little changed. Unemployment rates for Negro men, women, and teenagers were all significantly lower in 1968 than in 1967. The jobless rates for Negroes in these poverty neighborhoods showed greater improvement than for their counterparts in other urban neighborhoods.

Employment and labor force. Employment in the poverty neighborhoods averaged 6.1 million in 1968, down approximately 125,000 from 1967. Combined with a drop in unemployment of 70,000 , there were nearly 200,000 fewer workers in poverty neighborhoods than in 1967.

The decrease in the labor force was accompanied by a decline of a similar magnitude in the population of these poverty neighborhoods; as a result, the labor force participation rates for these workers were not substantially changed over the year. Whether the employment status of those leaving these neighborhoods has improved is dificult to determine, however.

by Kathryn D. Hoyle and Paul M. Schwab*

The employment situation improved in 1968, following a period of economic adjustment in 1967. Total employment increased to 75.9 million, a gain of 1.5 million persons from 1967. The 1968 unemployment rate, at 3.6 percent, was the lowest since 1953.

A heavy demand for final goods accounted for an accelerated first quarter of economic activity in 1968. An especially heavy demand for consumer goods contributed to a gain in real output (gross national product), which was the largest in 2 years, and the 450,000 first quarter increase in employment was the most substantial of the year. The unemployment rate dropped to 3.6 percent, from an average of 3.9 percent during the second half of 1967.

Economic activity slowed generally in the second quarter of 1968 as the fast growth rate realized during the early part of the year could no longer be sustained. Largely as a result of civil disorders and of general uncertainty within the business community about government tax policy, final sales, both at the consumer level and for business fixed investment, increased less rapidly. As a result, in the second quarter employment recorded a rise of only 275,000 , and unemployment was unchanged. Much of the uncertainty was clarified, however, in June when the 10 percent surcharge on individual and business income taxes was signed into law.

During the second half of 1968 , economic indicators were mixed but, on balance, presented a picture of continued strength. Employment growth was small in the third quarter, and the unemployment rate remained unchanged at 3.6 percent. By the end of the year, signs of an increased firmness in employment, production, and investment began to appear. In the fourth quarter, employment picked up sharply (by 425,000 ), and the unemployment rate averaged 3.4 percent.

## Employment

Total employment reached 75.9 million in 1968, an increase of 1.5 million from 1967. This year-to-year gain was slightly better than in the previous year but was a quarter of a million less than the 1965 and 1966 increases. The civilian labor force rose by 1.4 million in 1968, as growth slackened somewhat from the record gains of the previous year.

Employment in the nonagricultural sector of the economy accounted for all of the growth from 1967 to 1968 , rising to 72.1 million. This increase reflected a growth rate of 2.2 percent, about the same as in 1967 but down sharply from the 3.0 and 3.3 percent gains registered during 1965 and 1966.

Employment in agriculture was virtually unchanged in 1968 at 3.8 million. 1968 was the first year since 1959 that agricultural employment had not declined by at least 100,000 workers. Increased mechanization of farming operations will undoubtedly result in further employment declines in the agricultural sector, but these may continue to be smaller than those of past years.

[^1]Full- and part-time employment. The 1968 increase in full-time employment was accompanied by a sharp drop in the number of persons on part time for economic reasons. In 1968, the number of workers on full-time schedules increased by 1.2 million to 64.2 million, while the number of persons who wanted to work full time but could only find part-time work fell by 200,000 to 2.0 million. In addition, 1968 saw the creation of 525,000 part-time jobs for those persons who did not want or need full-time work. Most of the 9.7 million voluntary part-time jobs were filled by youths still in school and by adult women.

Persons who want full-time work but are forced to work part time for economic reasons represent a loss to the economy and are a major source of underutilization of human resources. The number of persons on economic part time declined 9 percent in 1968, as the number of adult men dropped sharply.

The number of persons working less than 35 hours by choice rose from 9.2 million in 1967 to 9.7 million in 1968. This was a 5.7 percent rise which was 3 times the growth rate in fulltime employment. This rapid increase, in part, reflected the scarce supply of full-time workers during the past several years. In addition, it reflects the shift in work schedules for clerical and sales personnel to better handle peak workloads; such work schedules often make use of the large supply of experienced women workers available in urban and suburban areas. Most of the persons who voluntarily work part time are women and teenagers.

Industry Developments
Nonfarm payroll employment increased 2.1 million in 1968 to a record 68.1 million. Although the increase exceeded slightly that of 1967, it still was well below the substantial gains posted during the rapid growth periods of 1965 and 1966.

Service industries continued to show large gains in 1968. However, most service industries experienced smaller year-to-year increases in 1968 than in 1967; only trade and finance showed larger employment gains. This slowdown within
the service industries occurred particularly during the second and third quarters.

Also, a highlight of the year was an acceleration in manufacturing job growth and renewed strength in contract construction employment. Employment in goods-producing industries rose much more rapidly than in 1967 and showed an increase for the year more than double the 1967 increase. Employment in these industries-manufacturing, construction, and mining--rose 360,000 , compared with a 140,000 increase in 1967. Nevertheless, the 1968 rise was only threetenths of the exceptional increase of 1966.

Service industries. Within the serviceproducing industries, the government sector registered the largest growth, rising by 580,000 to 12.2 million. Although substantial, this was the smallest annual gain since 1965 and was 160,000 less than the 1967 increase. The pickup was accounted for almost entirely by State and local government employment. Federal employment remained relatively unchanged in 1968 at 2.7 million, as employment cutbacks were initiated in the latter part of the year in connection with the passage of the income tax surcharge.

Trade employment had a 500,000 job pickup in 1968 , substantially above the 370,000 increase in the preceding year. Three-fourths of this rise was in retail trade, which posted its largest gains in the first and third quarters of the year.

Employment in services rose by 440,000 in 1968, the smallest annual increase since 1965. Almost half of the 1968 increase occurred in private medical and other health services.

Finance, insurance, and real estate showed a job gain exceeding 1967's as employment rose by 140,000 . The 75,000 employment rise in transportation and public utilities was the smallest gain since 1964.

Manufacturing. Employment in manufacturing rose 300,000 in 1968 to a record 19.7 million. The increase exceeded the 1967 job gain by 80,000 but was also well below the employment gains in 1965 and 1966. The increase brought
the jobless rate for manufacturing workers down from 3.7 percent in 1967 to 3.3 percent in 1968, near the post-Korean war low reached in 1966.

Factory employment was relatively unchanged during the first quarter of 1968 but expanded substantially in the spring. Following another lull in employment during the late summer, a resurgence in production brought about increased employment during the fourth quarter of the year.

Seventeen of the 21 manufacturing industries registered job gains in 1968, compared with only 12 in the preceding year, and the increases were equally distributed between durable and nondurable goods industries. This was in contrast to most recent years, when durable goods employment gains constituted a larger share of the total employment increase.

Employment advances in durable goods were concentrated in a few industries in 1968; more than half of the total gain was accounted for by an 80,000 employment rise in transportation equipment. The bulk of the remaining increases were in the ordnance, furniture, and fabricated metals industries. Primary metals and machinery were the only durable goods industries to show employment declines.

In nondurable goods, the textiles, chemicals, and rubber industries showed the largest increases during the year; together they accounted for two-thirds of the job gain. Smaller employment pickups were reported in the apparel, paper, and printing industries. Food and tobacco employment posted slight declines for the year.

At 14.5 million in 1968, the number of factory production workers was up 180,000 from the previous year. The 1968 level represented the largest number of factory production workers employed since World War II and thus surpassed the post-World War II highs of 1966 and 1967. Between 1961 and 1966, a continued rise in the number of production workers led to a resurgence in the employment of all blue-collar workers, particularly semiskilled operatives. The more moderate increases in manufacturing employment in 1967 and 1968, however, have resulted in much smaller gains in total bluecollar employment during the past 2 years.

Construction and mining. Employment in contract construction rebounded strongly in 1968 after a decline in 1967. At nearly 3.3 million in 1968, contract construction employment rose 50,000 over the year. It reached a peak early in the year and then slackened off during the next few months. In the second half of 1968 , however, employment rose fairly steadily, and the 1968 annual average equaled the previous high registered in 1966.

After a decade of continuous declines, mining employment edged up to 625,000 in 1968. Largely responsible for this was the settlement of the 9 month copper work stoppage; workers began returning to payrolls in March 1968.

Hours and earnings. Average weekly hours for all rank and file employees on private nonagricultural payrolls declined by 0.2 hour to 37.8 hours in 1968. Except for manufacturing, all major industry sectors had shorter or unchanged workweeks; trade recorded the largest decline. Since 1960, the average workweek in trade has decreased without interruption, a trend primarily reflecting a shift to increased part-time employment in the industry.

The factory production worker's average workweek edged up 0.1 hour in 1968 to 40.7 hours. In 1967, the manufacturing workweek had declined for the first time in 7 years as a result of the economic readjustment that followed the marked economic expansion in 1965-66. The 1967 average workweek continued virutally unchanged through the first 8 months of 1968 . However, a strengthening in manufacturing activity during the last 4 months raised the average for the year one-tenth of an hour. Average overtime hours in manufacturing increased slightly in 1968; generally higher monthly levels were recorded during the second half. For the year, average overtime hours edged up 0.2 hour to 3.6 hours.

Hourly earnings of the Nation's nonsupervisory workers averaged $\$ 2.85$ in 1968 , up 17 cents from the 1967 average. The 6.3 percent increase was the largest annual gain since 1951. As a result, gross average weekly earnings rose $\$ 5.89$ to $\$ 107.73$, an increase of 5.8 percent.

Because of increases in the price level, however, average weekly earnings for all rank and file workers increased only about 1.5 percent in terms of constant 1957-59 dollars.

Workers in nonmanufacturing industries generally posted higher percentage gains in hourly earnings than factory workers, but reduced or stable workweeks resulted in smaller increases in average weekly earnings. Employees in the finance sector had the largest increase in average weekly earnings ( 6.6 percent), followed by contract construction ( 5.4 percent), trade ( 5.2 percent), and mining ( 4.7 percent). For factory workers, average weekly earnings increased by 6.6 percent (to $\$ 122.51$ ), the largest annual gain since 1959.

Take-home pay (gross weekly earnings less Federal income and social security taxes) for all private nonagricultural workers having three dependents increased 4.9 percent in 1968; it rose by $\$ 4.42$ to $\$ 95.28$. This advance was limited because of the increase in social security withholding taxes effective at the beginning of the year and the 10 percent surtax also effective during most of 1968. Due to a continued rise in the consumer price index, real take-home pay remained relatively unchanged in 1968.

## Unemployment

The employment expansion from 1967 to 1968 not only provided 1.4 million new workers with jobs but also removed 150,000 workers from the ranks of the unemployed. Unemployment dropped from an average of $2,975,000$ persons in 1967 to $2,825,000$ in 1968--the lowest level in over a decade. As a result, the Nation's unemployment rate declined from 3.8 percent in both 1966 and 1967 to 3.6 percent in 1968, the lowest percentage since 1953 and the Korean war period.

The unemployment rate was relatively stable during the course of the year. After averaging 3.9 percent in the last quarter of 1967 , the rate fell to 3.6 percent in the first quarter of 1968 and remained at that point in the second and third quarters. However, in the fourth quarter of 1968, the rate dropped to 3.4 percent.

Almost all (nearly 85 percent) of the decline in unemployment during 1968 took place among persons who had lost their jobs. The numbers unemployed because of quitting a job or entering the labor force were virtually unchanged. As a result, the unemployment rate for joblosers fell from 1.6 percent in 1967 to 1.3 percent in 1968. For nonwhite workers, however, about 60 percent of the improvement in unemployment occurred among job leavers and labor force entrants, rather than among job losers.

The number of persons unemployed for 15 weeks or longer was reduced to 400,000 in 1968 , a decline of 35,000 from 1967. This drop occurred despite the drastic reductions in longterm unemployment that had already occur red in the past several years. At the beginning of the current expansion (in 1961), 1.5 million persons, or nearly one-third of the unemployed, had been without work for 15 weeks or longer. The level has thus declined by 1.1 million to only 15 percent of the total in 1968. This was a reduction of nearly 75 percent, a rate of decrease much more rapid than for total unemployment. In addition, very long-term unemployment of 27 weeks or longer also edged down further in 1968 to 150,000 .

Long-term unemployment rates (the number of persons out of work 15 weeks or longer as a proportion of the civilian labor force) also give evidence of the decrease inextended joblessness. In 1968, 0.5 percent of the civilian labor force had been unemployed for 15 weeks or longer. The 0.5 percent figure was down from the 1967 annual average of 0.7 percent and was the lowest since 1953.

Continuing reductions in long-term unemployment are particularly significant because the effects of long-term unemployment are felt throughout the economy, not only in terms of unrealized output and consumption but also in terms of the problems of individual workers caught in this situation. Unemployment of long duration tends to result in loss of self-esteem and self-confidence, as well as in loss of income and the depletion of savings. Problems in finding another job become more difficult as time passes--particularly if one is Negro, unskilled, or over 45 years of age.

Although the numbers of older workers, Negroes, and unskilled workers who are unemployed for 15 weeks or longer have declineddue to the insistent pressures of continued economic expansion, the over-representation of these workers among the long-term unemployed has improved little, if at all. In 1968, Negro workers accounted for only 11 percent of the civilian labor force but constituted over 20 percent of the long-term unemployed; unskilled nonfarm laborers were 5 percent of the labor force and 9 percent of the long-term unemployed. Men age 45 years and over accounted for less than 15 percent of the unemployed but were one-fourth of long-term unemployment.

Short-term unemployment (less than 5 weeks), at 1.6 million in 1968, has not declined since 1966 when, for the first time, over half of the unemployed had been seeking work for less than 5 weeks. A large and growing proportion of the unemployed are youngsters looking for part-time work or their first full-time jobs, women reentering the labor force in search of work, or persons who have quit one job to look for another--all of which makes this kind of "frictional" unemployment very difficult to reduce.

## Occupational Developments

The largest number of new job opportunities in 1968 occurred in white-collar occupations as growth in these jobs accounted for over fourfifths of the total employment increase. Whitecollar employment rose by 1.3 million in 1968 to a total of 35.6 million, with the most rapid growth occurring in the professional and technical fields and in clerical jobs. Professional and technical employment rose by 450,000 and clerical by 475,000 .

The other two segments of white-collar employment showed renewed strength in 1968. The employment of managers, officials, and proprietors rose by 275,000 , its largest rise since 1962. Sales worker employment increased by 125,000 after showing virtually no change in both 1966 and 1967.

The unemployment rate for white-collar workers edged down from 2.2 percent in 1967 to 2.0 percent in 1968. This returned the rate to its 1966 position, which was the lowest since 1959.

Growth in blue-collar occupations was much slower in 1968 than that in white-collar jobs. Blue-collar employment rose by about 275,000 to 27.5 million, with nearly two-thirds of the gain in craftsmen jobs. The number of employed craftsmen rose by only 175,000 in 1968 , after average yearly increases of over 275,000 for the past 3 years. Operative employment increased by 75,000 , about the same as in 1967 but well below the substantial rises of 1963-66 when yearly gains averaged 450,000 . The employment of laborers was virtually unchanged in both 1967 and 1968, following a large decline in 1966.

The unemployment rate for blue-collar workers declined from 4.4 percent in 1967 to 4.1 percent in 1968. The greatest improvement occurred among operatives whose rate fell 0.5 percentage point to 4.5 percent, nearly returning this rate to its 1966 point. The unemployment rate for craftsmen edged down to 2.4 percent, and the rate for nonfarm laborers fell from.7.6 to 7.2 percent; both of these rates were the lowest since the Korean war.

Among service workers, private household workers continued their steady decline of the last 3 years, falling by nearly 50,000 in 1968 . The employment of other service workers rose by 100,000 to 7.7 million; this was the smallest gain of the decade for this category. The unemployment rate for other service workers was unchanged from 1967 at 4.6 percent.

Developments Among the Major Age-Sex Groups
Adult men. The employment gains in 1968 were highlighted by improvements in the employment picture for adult men. In 1967, 44.3 million men 20 years of age and over were employed; in 1968, the total was 44.9 million, an increase of 575,000 . Since labor force growth for adult men was also quite large $(500,000)$, unemployment was reduced by only 75,000 , to slightly below 1.0 million.

After averaging 2.3 percent in 1967, the unemployment rate for adult men edged down to 2.2 percent in 1968, the lowest rate recorded since records began in the late 1940's. The unusually low unemployment rate for this group of workers is particularly significant because they are frequently the only or primary wage earners for their families.

Within the adult male group, the employment of men 20-24 years of age was unchanged from 1967. Growth among this group had been strong in 1963-65 before large increases in the Armed Forces began to cut into their civilian labor force increase. The unemployment of these younger males was up slightly in 1968, and their unemployment rate rose from 4.7 to 5.1 percent. The heavy overall demand for labor did not reduce the numbers of unemployed 20-24 year-old males in the last 2 years. Nevertheless, their unemployment rates since 1966 have been the lowest for any period since the Korean war.

The employment of men age 25-64 years rose from 37.4 million in 1967 to 38.0 million in 1968 , and unemployment fell by 100,000 to 675,000 . The unemployment rate for this group dropped from 2.0 percent in 1967 to 1.7 percent in 1968, the lowest rate since records began in the late 1940's. The unemployment rate for married men was also at a record low--1.6 percent in 1968, down from 1.8 percent in 1967.

Adult women. The number of women in the labor force rose significantly from 1967 to 1968 , and the proportion of all adult women working or looking for work continued to increase. In 1968, an additional 800,000 women age 20 years and over were added to the labor force. Employment reached 25.3 million, a gain of 875,000 . The increased availability of adult women as a source of labor and the equally growing demand for their services have been two of the most important developments of recent years.

Unemployment among adult women fell significantly in 1968--by $100,000-$-to less than 1.0 million. As a result, their unemployment rate dropped from 4.2 to 3.8 percent (the same as in 1966). The 3.8 percent rate was the lowest for adult women since 1953.

The number of employed young adult women (age $20-24$ years) rose from 3.7 million in 1967 to nearly 4.0 million in 1968 . The gain was large enough to absorb their labor force growth but left the number unemployed virtually unchanged at 275,000 . The unemployment rate for young adult women moved downward from 1961 to 1966 but has displayed no consistent trend since then. Their jobless rate was 6.7 percent in 1968.

Teenagers. Providing jobs for teenagers remained as one of the most troublesome problems on the manpower scene in 1968. The number of employed teenagers rose from 5.7 million in 1967 to 5.8 million in 1968, an increase which equaled their labor force gain. Teenage unemployment remained at 850,000 and their jobless rate--at 12.7 percent--was essentially the same as in both 1966 and 1967.

Once a teenager has a job, however, he is not much more likely than an adult to lose it; the total job-loser rate in 1968 was 1.3 percent while the teenage job-loser rate was 1.9 percent. The major differences between the teenage and total unemployment rates occurred because of the greater propensity of teenagers to leave jobs or to enter the labor force and the difficulties that workers in these categories faced. The jobleaver and reentrant rates for teenagers were 3 to $3-1 / 2$ times the rates for all workers, and their new entrant rate, which was the largest single component of teenage unemployment, was 10 times the overall rate for workers with no previous experience.

## Negro Workers $1 /$

The Negro employment situation in 1968 continued its record of moderate employment gains posted since the 1963-66 period of rapid growth. Negro employment totaled 8.2 million for the year, an increase of 160,000 workers--exceeding slightly the gain recorded in 1967. Since 1963,

1/ Statistics for nonwhite workers are used to measure the employment of Negro workers, who comprise 92 percent of all nonwhites in the United States.
the employment of Negroes has risen by more than 1.0 million workers. Employment of Negro adult men, increasing by 50,000 in 1968, registered its smallest annual gain since 1961.

Unemployment among Negro workers improved in 1968 as 30 percent of the total decline in unemployment occurred among Negroes. The number of jobless Negroes totaled 600,000 , about 40,000 less than in 1967. Their unemployment rate was 6.7 percent, down significantly from 7.4 percent in 1967 and at a post-Korean war low. The jobless rate for Negro adult men ( 3.9 percent) reached a new low and that for women ( 6.3 percent) was the lowest since the Korean war
period. Despite the over-the-year improvement in the Negro unemployment situation, the Negro jobless rate still remained twice that of white workers.

Increased employment opportunities for Negro teenagers in 1958 did not succeed in significantly reducing their unemployment problem. Their jobless rate was 25.0 percent, down only slightly from the rate recorded in 1967. Given the relatively unchanged unemployment rate for white youths ( 11.0 percent), however, the gap between the two groups' unemployment rates edged down for the first time since 1964. In 1968, the rate for Negro 16-19 year-olds was 2.3 times as high as that for white teenagers.

${ }_{2}^{1}$ Combined with services.
${ }_{3}^{2}$ Series revised to 1968 benchmark; not strictly comparable with previously published data.
${ }^{3}$ combined with construction.
${ }^{4}$ Federal employment in Maryland and Virginia sectors of the Washington Standard Metropolitan Statistical Area
is included in data for the District of Columbia.
${ }_{6}$ Area included in Chicago-Northwestern Indiana Standard Consolidated Area.
${ }_{7}^{6}$ Area included in New York-Northeastern New Jersey Standard Consolidated Area.
${ }_{8}^{7}$ Subarea of Rochester Standard Metropolitan Statistical Area.
${ }^{8}$ Subarea of New York Standard Metropolitan Statistical Area.
${ }^{9}$ Total-includes data for industry divisions not shown separately. Services excludes agriculture, forestry, and fisheries.

* Not available.

NOTE: Data for the current month are preliminary.

$\mathbf{1}^{\text {Not available. }}$
NOTE: Averages presented in this table have been computed using data collected by the U.S. Civil Service Commission from all agencies of the executive branch of the Federal Govemment; the data cover both salaried workers and hourly paid wage-board employees. Since these averages relate to hours and earnings of all workers, both supervisory and nonsupervisory, they are not comparable to similar data presented in table $\mathrm{C}-2$ which relate only to production or nonsupervisory workers.

C-4: Average hourly earnings excluding overtime of production workers on manufacturing payrolls, by industry

${ }^{1}$ Derived by assuming that overtime hours are paid at the rate of time and one-half.
${ }^{2}$ Not availahle as average overtime rates are significantly above tíme and one-half. Inclusion of data for the group in the noodurable goods total has little effect.
ERRATUM: August 1968 value for manufacturing, $\$ 2.87$ instead of $\$ 2,86$.
NOTE: Data for the 2 most recent moaths are preliminary.
C.5: Gross and spendable average weekly earnings of production or nonsupervisory workers ${ }^{1}$ on private nonagricultural payrolls, in current and 1957-59 dollars

$\mathbf{1}_{\text {For coverage of series, see footnote } 1 \text {, table B-2. }}$
NOTE: Beginning April 1968, data reflect the income tax surcharge imposed by the Revenue and Expenditure Control Act of 1968. Data for the current month are preliminary.

C-6: Indexes of aggregate weekly man-hours and payralls in industrial and construction activities ${ }^{1}$

[^13]
## C-7: Average weekly hours of production or nonsupervisory workers ${ }^{\text {' }}$ on private nonagricultural payrolls, seasonally adjusted

#### Abstract

Additional information concerning the preparation of the labor force, employment, hours and earnings, and labor turnover series--concepts and scope, survey methods, and limitations--is contained in technical notes for each of these series, available from the Bureau of Labor Statistics free of charge.

## INTRODUCTION

The statistics in this periodical are compiled from three major sources: (1) household interviews, (2) payroll reports from employers, and (3) administrative statistics of unemployment insurance systems.

Data based on household intervievs are obtained from a sample survey of the population 16 years of age and over. The survey is conducted each month by the Bureau of the Census for the Bureau of Labor Statistics and provides comprehensive data on the labor force, the employed and the unemployed, including such characteristics as age, sex, color, marital status, occupations, hours of work, and duration of unemployment. The survey also provides data on the characteristics and past work experience of those not in the labor force. The information is collected by trained interviewers from a sample of about 50,000 households, representing 449 areas in 863 counties and independent cities, with coverage in 50 States and the District of Columbia. The data collected are based on the activity or status reported for the calendar week including the 12 th of the month.

Data basedon establishment payroll records are compiled each month from mail questionnaires by the Bureau of Labor Statistics, in cooperation with State agencies. The payroll survey provides detailed industry information on nonagricultural wage and salary employment, average weekly hours, average hourly and weekly earnings, and labor turnover for the Nation, States, and metropolitan areas. The figures are based on payroll reports from a sample of establishments employing about 25 million nonagriculture wage and salary workers. The data relate to all workers, full- or part-time, who received pay during the payroll period which includes the 12th of the month.

Data based on administrative records of unemployment insurance systems furnish a complete count of insured unemployment among the two-thirds of the Nation's labor force covered by unemployment insurance programs. Weekly reports, by State, are issued on the number of initial claims, the volume and rate of insured unemployment under State unemployment insurance programs, and the volume under programs of unemployment compensation for Federal employees, ex-servicemen, and railroad workers. These statistics are published by the Bureau of Employment Security, U.S. Department of Labor, in "Unemployment Insurance Claims."

## Relation between the household and payroll series

The household and payroll data supplement one another, each providing significant types of information that the other cannot suitably supply. Population characteristics, for example, are readily obtained only from the household survey whereas detailed industrial classifications can be reliably derived only from establishment reports.

Data from these two sources differ from each other because of differences in definition and coverage, sources of information, methods of collection, and estimating procedures. Sampling variability and response errors are additional reasons for discrepancies. The major factors which have a differential effect on levels and trends of the two series are as follows:

## Employment

Coverage. The household survey definition of employment comprises wage and salary workers (including domestics and other private household workers), selfemployed persons, and unpaid workers who worked 15 hours or more during the survey week in family-operated enterprises. Employment in both agricultural and nonagricultural industries is included. The payroll survey covers only wage and salary employees on the payrolls of nonagricultural establishments.

Multiple jobholding. The household approach prom vides information on the work status of the population without duplication since each person is classified as employed, unemployed, or not in the labor force. Employed persons holding more than one job are counted only once and are classified according to the jobat which they worked the greatest number of hours during the survey week. In the figures based on establishment records, persons who worked in more than one establishment during the reporting period are counted each time their names appear on payrolls.

Unpaid absences from jobs. The household survey includes among the employed all persons who had jobs but were not at work during the survey week--that is, were not working but had jobs from which they were temporarily absent because of illness, baḍ weather, vacation, labor-management dispute, or because they were taking time off for various other reasons, even if they were not paid by their employers for the time off. In
the figures based on payroll reports, persons on leave paid for by the company are included, but not those on leave without pay for the entire payroll period.

## Hours of Work

The household survey measures hours actually worked whereas the payroll survey measures hours paid for by employers. In the household survey data, all persons with a job but not at work are excluded from the hours distributions and the computations of average hours. In the payroll survey, employees on paid vacation, paid holiday, or paid sick leave are included and assigned the number of hours for which they were paid during the reporting period.

## Comparability of the household interview data with other series

Unemployment insurance data. The unemployed total from the household survey includes all persons who did not have a job at all during the survey week and were looking for work or were walting to be called back to a job from which they had been laid off, regardless of whether or not they were eligible for unemployment insurance. Figures on unemployment insurance claims, prepared by the Bureau of Employment Security of the Department of Labor, exclude persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (agriculture, State and local government, domestic service, self employment, unpaid family work, nonprofit organizations, and firms below a minimum size).

In addition, the qualifications for drawing unemployment compensation differ from the definition of unemployment used in the household survey. For example, persons with a job but not at work and persons working only a few hours during the week are sometimes eligible for unemployment compensation but are classified as employed rather than unemployed in the household survey.

Agricultural employment estimates of the Department of Agriculture. The principal differences in coverage
are me inclusion of persons under 16 in the Statistical Research Service (SRS) series and the treatment of dual jobholders who are counted more than once if they worked on more than one farm during the reporting period. There are also wide differences in sampling techniques and collecting and estimating methods, which cannot be readily measured in terms of impact on differences in level and trend of the two series.

## Comparability of the payroll employment data with other series

Statistics on manufactures and business, Bureau of the Census. BLS establishment statistics on employment differ from employment counts derived by the Bureau of the Census from its censuses or annual sample surveys of manufacturing establishments and the censuses of business establishments. The major reasons for some noncomparability are different treatment of business units considered parts of an establishment, such as central administrative offices and auxiliary units, the industrial classification of establishments, and different reporting patterns by multiunit companies. There are also differences in the scope of the industries covered, e.g., the Census of Business excludes contract construction, professional services, public utilities, and financial establishments, whereas these are included in BLS statistics.

County Business Patterns. Data in County Business Patterns, published jointly by the U.S. Departments of Commerce and Health, Education, and Welfare, differ from BLS establishment statistics in the treatment of central administrative offices and auxiliary units. Differences may also arise because of industrial classification and reporting practices. In addition, CBP excludes interstate railroads and government, and coverage is incomplete for some of the nonprofit activities.

Employment covered by State unemployment insurance programs. Not all nonagricultural wage and salary workers are covered by the unemployment insurance programs. All workers in certain activities, such as interstate railroads, are excluded. In addition, small firms in covered industries are also excluded in 31 States. In general, these are establishments with less than four employees.

## Labor Force Data

## COLLECTION AND COVERAGE

Statistics on the employment status of the population, the personal, occupational, and other characteristics of the employed, the unemployed, and persons not in the labor force, and related data are compiled for the BLS by the Bureau of the Census in its Current Population Survey (CPS). A detailed description of this survey appears in "Concepts and Methods Used in Manpower Statistics from the Current Popuiation Survey"' (BLS Re-
port. 313). This report is availablefrom BLS on request.

These monthly surveys of the population are conducted with a scientifically selected sample designed to represent the civilian noninstitutional population 16 years and over. Respondents are interviewed to obtain information about the employment status of each member of the household 16 years of age and over. The inquiry relates to activity or status during the calendar week,

Sunday through Saturday, which includes the 12 th of the month. This is known as the survey week. Actual field interviewing is conducted in the following week.

Inmates of institutions and persons under 16 years of age are not covered in the regular monthly enumerations and are excluded from the population and labor force statistics shown in this report. Data on members of the Armed Forces, who are included as part of the categories "total noninstitutional population" and "total labor force," are obtained from the Department of Defense.

Each month, 50,000 occupied units are designated for interview. About 2,250 of these households are visited but interviews are not obtained because the occupants are not found at home after repeated calls or are unavallable for other reasons. This represents a noninterview rate for the survey of about 4.5 percent. In addition to the 50,000 occupied units, there are 8,500 sample units in an average month which are visited but found to be vacant or otherwise not to be enumerated. Part of the sample is changed each month. The rotation plan provides for three-fourths of the sample to be common from one month to the next, and one-half to be common with the same month a year ago.

## CONCEPTS

Employed persons comprise (a) all those who during the survey week did any work at all as paid employees, in their own business, profession, or farm, or who worked 15 hours or more as unpaid workers in an enterprise operated by a member of the family, and (b) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, labor-management dispute, or personal reasons, whether or not they were paid by their employers for the time off, and whether or not they were seeking other jobs.

Each employed person is countedonly once. Those who held more than one job are counted in the job at which they worked the greatest number of hours during the survey week.

Included in the total are employed citizens of foreign countries, temporarily in the United States, who are not living on the premises of an Embassy.

Excluded are persons whose only activity consisted of work around the house (such as own home housework, and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations.

Unemployed persons comprise all persons who did not work during the survey week, who made specific efforts to find a job within the past 4 weeks, and who were available for work during the survey week (except for temporary illness). Also included as unemployed are those who did not work at all, were available for work, and (a) were waiting to be called back to a job from which they had been laid off; or (b) were waiting to report to a new wage or salary job within 30 days.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a personwas employed or ceased looking for work is considered to break the continuity of the present period of seeking work. Average duration is an arithmetic mean computed from a distribution by single weeks of unemployment.

Unemployed persons by reasons for unemployment are divided into four major groups. (1) Job losers are persons whose employment ended involuntarily who immediately began looking for work and persons on layoff. (2) Job leavers are persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work. (3) Reentrants are persons who previously worked at a full-time job lasting 2 weeks or longer but who were out of the labor force prior to beginning to look for work. (4) New entrants are persons who never worked at a full-time job lasting 2 weeks or longer.

The civilian labor force comprises the total of all civilians classified as employed or unemployed in accordance with the criteria described above. The "total labor force" also includes members of the Armed Forces stationed either in the United States or abroad.

The unemployment rate represents the number unemployed as a percent of the civilian labor force. This measure can also be computed for groups within the labor force classified by sex, age, marital status, color, etc. The job-loser, job-leaver, reentrant, and new entrant rates are each calculated as a percent of the civilian labor force; the sum of the rates for the four groups thus equals the total unemployment rate.

Not in labor force includes all civilians 16 years and over who are not classified as employed or unemployed. These persons are further classified as "engaged in own home housework," "in school," "unable to work" because of long-term physicalor mental illness, and "other." The "other" group includes for the most part retired persons, those reported as too old to work, the voluntarily idle, and seasonal workers for whom the surv"ey week fell in an "off" season and who were not reported as unemployed. Persons doing only incidental unpaid family work (less than 15 hours) are also classified as not in the labor force.

For persons not in the labor force, data on previous work experience, intentions to seek work again, desire for a job at the time of interview, and reasons for not looking for work are compiled on a quarterly basis. The detailed questions for persons not in the labor force are asked only in those households that are new entrants to the sample and in those that are reentering the sample after 8 months' absence.

Occupation, industry, and class of worker for the employed apply to the job held in the survey week. Per-
sons with two or more jobs are classified in the job at which they worked the greatest number of hours during the survey week. The unemployed are classified according to their latest full-time civilian job lasting 2 weeks or more. The occupation and industry groups used in data derived from the CPS household interviews are defined as in the 1960 Census of Population. Information on the detailed categories included in these groups is available upon request.

The class-of-worker breakdown specifies "wage and salary workers," subdivided into private and government workers, "self-employed workers," and "unpaid family workers." Wage and salary workers receive wages, salary, commission, tips, or pay in kind from a private employer or from a governmental unit. Self-employed persons are those who work for profit or fees in their own business, profession, or trade, or operate a farm. Unpaid family workers are persons working without pay for 15 hours a week or more on a farm or in a business operated by a member of the household to whom they are related by blood or marriage.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, a person who normally works 40 hours a week but who was off on the Veterans Day holiday would be reported as working 32 hours even though he was paid for the holiday.

For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the week. However, all the hours are credited to the major job.

Persons who worked 35 hours or more in the survey week are designated as working "full time"; persons who worked between 1 and 34 hours are designated as working "part time." Part-time workers are classified by their usual status at their present job (either full time or part time) and by their reason for working part time during the survey week (economic or other reasons). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. "Other reasons" include: Labor dispute, bad weather, own illness, vacation, demands of home housework, school, no desire for full-time work, and full-time worker only during peak season. Persons on full-time schedules include, in addition to those working 35 hours or more, those who worked from l-34 hours for noneconomic reasons but usually work full time.

Full-and part-time labor force. The full-time labor force consists of persons working on full-time schedules, persons involuntarily working part time (because fulltime work is not available), and unemployed persons seeking full-time jobs. The part-time labor force consists of persons working part time voluntarily and unemployed persons seeking part-time work. Persons with a job but not at work during the survey week are classified ac-
cording to whether they usually work full or part time.

Labor force time lost is a measure of man-hours lost to the economy through unemployment and involuntary part-time employment and is expressed as a percent of potentially available man-hours. lt is computed by assuming: (1) that unemployed persons looking for full-time work lost an average of 37.5 hours, (2) that those looking for parttime work lost the average number of hours actually worked by voluntary part-time workers during the survey week, and (3) that persons on part time for economic reasons lost the difference between 37.5 hours and the actual number of hours they worked.

## ESTIMATING METHODS

Under the estimation methods used in the CPS, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. There are no subsequent adjustments to independent benchmark data on labor force, employment, or unemployment. Therefore, revisions of the historical data are not an inherent feature of this statistical program.

1. Noninterview adjustment. The weights for all interviewed households are adjusted to the extent needed to account for occupied sample households for which no information was obtained because of absence, impassable roads, refusals, or unavailability for other reasons. This adjustment is made separately by groups of sample areas and, within these, for six groups--color (white and nonwhite) within the three residence categories (urban, rural nonfarm, and rural farm). The proportion of sample households not interviewed varies from 4 to 6 percent depending on weather, vacations, etc.
2. Ratio estimates. The distribution of the population selected for the sample may differ somewhat, by chance, from that of the Nation as a whole, in such characteristics as age, color, sex, and residence. Since these population characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio estimates as follows:
a. First-stage ratio estimate. This is a procedure in which the sample proportions are weighted by the known 1960 Census data on the color-residence distribution of the population. This step takes into account the differences existing at the time of the 1960 Census between the color-residence distribution for the Nation and for the sample areas.
b. Second-stage ratio estimate. In this step, the sample proportions are weighted by independent current estimates of the population by age, sex, and color. These estimates are prepared by carrying forward the most recent census data (1960) to take account of subsequent aging of the population, mortality, and migra-
tion between the United States and other countries.
3. Composite estimate procedure. In deriving statistics for a given month, a composite estimating procedure is used which takes account of net changes from the previous month for continuing parts of the sample (75 percent) as well as the sample results for the current month. This procedure reduces the sampling variability of month-to-month changes especially and of the levels for most items also.

## Rounding of Estimates

The sums of individual items may not always equal the totals shown in the same tables because of independent rounding of totals and components to the nearest thousand. Differences, however, are insignificant.

## Reliability of the Estimates

Since the estimates are based on a sample, they may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures.

The standard error is a measure of sampling variability, that is, the variations that might occur by chance because only a sample of the population is surveyed. The chances are about 2 out of 3 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 19 out of 20 that the difference would be less than twice the standard error.

Table A shows the average standard error for the major employment status categories, by sex, computed from data for past months. Estimates of change derived from the survey are also subject to sampling variability. The standard error of change for consecutive months is also shown in table A. The standard errors of level shown in table A are acceptable approximations of the standard errors of year-to-year change.

The figures presented in table $B$ are to be used for other characteristics and are approximations of the standard errors of all such characteristics. They should be interpreted as providing an indication of the order of magnitude of the standard errors rather than as the precise standard error for any specific item.

The standard error of the change in an item from one month to the next month is more closely related to the standard error of the monthly level for that item than to the size of the specific month-to-month change itself. Thus, in order to use the approximations to the standard errors of month-to-month changes as presented in table $C$, it is first necessary to obtain the standard error of the monthly level of the item in table B , and then find the standard error of the month-to-month change in table C corresponding to this standard error of level. It should

Table A. Average standard error of major employment status categories

| Employment status and sex | Average standard error of-- |  |
| :---: | :---: | :---: |
|  | Monthly level | Month to-month change (consecutive months only) |

| Agriculture. . . . . . . . . . | 50 | 40 |
| Nonagricultural employment | 150 | 115 |
| Unemployment. . . . . . . . | 50 | 55 |

Table B. Standard error of level of monthly estimates
(In thousands)

| Size of estimate | Both sexes |  | Male |  | Female |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total or white | Nonwhite | $\begin{gathered} \text { Total } \\ \text { or. } \\ \text { white } \end{gathered}$ | Nonwhite | Total or white | Nonwhite |
| 10 | 4 | 4 | 6 | 4 | 6 | 4 |
| 50 | 9 | 9 | 11 | 9 | 11 | 9 |
| 100 | 12 | 12 | 16 | 12 | 16 | 12 |
| 250 | 20 | 17 | 25 | 17 | 25 | 17 |
| 500 | 30 | 25 | 34 | 25 | 34 | 25 |
| 1,000. | 40 | 35 | 50 | 35 | 50 | 35 |
| 2,500. | 60 | 40 | 75 | 40 | 75 | 40 |
| 5,000. | 85 | 45 | 90 | . . . | 90 | . . |
| 10,000 | 115 | . | 115 | . . | 115 | $\ldots$ |
| 20,000 . . . | 150 | . $\cdot$ | 125 | ... | 125 | ... |
| 30,000 . . . | 170 | ... | . $\cdot$ | ... | ... | $\ldots$ |
| 40,000 . . . | 180 | ... | . . | ... | ... |  |

be noted that table $C$ applies to estimates of change between 2 consecutive months. For changes between the current month and the same month last year, the standard errors of level shown in table B are acceptable approximations.

Illustration: Assume that the tables showed the total number of persons working a specific number of hours as $15,000,000$, an increase of 500,000 over the previous month. Linear interpolation in the first column of table B shows that the standard error of $15,000,000$ is about 133,000 . Consequently, the chances are about 68 out of 100 that the sample estimate differs by less than 133,000 from the figure which would have been obtained from a complete count of the number of persons working the given number of hours. Using the 133,000 as the standard error of the monthly level in table $C$, it may be seen that the standard error of the 500,000 increase is about 126,000.

Table C. Standard error of estimates of month-to-month change
(In thousands)

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Where the numerator is a subclass of the denominator, estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerator of the percentage, particularly if the percentage is large ( 50 percent or greater). Table $D$ shows the standard errors for percentages derived from the survey. Linear interpolation may be used for percentages and base figures not shown in table $D$.

Table D. Standard error of percentage

| Base of percentages (thousands) | Estimated percentage |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} 1 \\ \text { or } \\ 99 \end{gathered}$ | $\begin{gathered} 2 \\ \text { or } \\ 98 \end{gathered}$ | $\begin{gathered} 5 \\ \text { or } \\ 95 \end{gathered}$ | $\begin{aligned} & 10 \\ & \text { or } \\ & 90 \end{aligned}$ | $\begin{aligned} & 15 \\ & \text { or } \\ & 85 \end{aligned}$ | $\begin{aligned} & 20 \\ & \text { or } \\ & 80 \end{aligned}$ | $\begin{aligned} & 25 \\ & \text { or } \\ & 75 \end{aligned}$ | $\begin{aligned} & 35 \\ & \text { or } \\ & 65 \end{aligned}$ | 50 |

## Establishment Data

## COLLECTION

Payroll reports provide current information on wage and salary employment, hours, earnings, and labor turnover in nonagricultural establishments, by industry and geographic location.

## Federal-State Cooperation

Under cooperative arrangements with State agencies, the respondent fills out a single employment or labor turnover reporting form, which is then used for national, State, and area estimates. This eliminates duplicate reporting on the part of respondents and, together with the use of identical techniques at the national and State levels, insures maximum comparability of estimates.

State agencies mail the forms to the establishments and examine the returns for consistency, accuracy, and completeness. The States use the information to prepare

State and area series and then send the establishment data to the BLS for use in preparing the national series.

## Shuttle Schedules

Two types of data collection schedules are used: Form BLS 790--Monthly Report on Employment, Payroll, and Hours; and Form DL 1219--Monthly Report on Labor Turnover. These schedules are of the "shuttle" type, with space for each month of the calendar year. The collecting agency returns the schedule to the respondent each month so that the next month's data can be entered. This procedure assures maximum comparability and accuracy of reporting, since the respondent can see the figures he has reported for previous months.

Form BLS 790 provides for entry of data on the number of full- and part-time workers on the payrolls of non-
agricultural establishments and, for most industries, payroll and man-hours of production and related workers or nonsupervisory workers for the pay period which includes the 12th of the month. The labor turnover schedule provides for the collection of information on the total number of accessions and separations, by type, during the calendar month.

## CONCEPTS

## Industrial Classification

Establishments reporting on Form BLS 790 and Form DL 1219 are classified into industries on the basis of their principal product or activity determined from information on annual sales volume. This information is collected each year on a supplement to the monthly 790 or 1219 report. For an establishment making more than one product or engaging in more than one activity, the entire employment of the establishment is included under the industry indicated by the most important product or activity.

All national, State, and area employment, hours, earnings, and labor turnover series are classified in accordance with the Standard Industrial Classification Manual, Bureau of the Budget, 1957, as amended by the 1963 Supplement.

## Industry Employment

Employment data, except those for the Federal Government, refer to persons on establishment payrolls who received pay for any part of the pay period which includes the 12th of the month. For Federal Government establishments, employment figures represent the number of persons who occupied positions on the last day of the calendar month. Intermittent workers are counted if they performed any service during the month.

The data exclude proprietors, the self-employed, unpaid volunteer, or family workers, farm workers, and domestic workers in households. Salaried officers of corporations are included. Government employment covers only civilian employees; military personnel are excluded.

Persons on establishment payrolls who are on paid sick leave (when pay is received directly from the firm), on paid holiday or paid vacation, or who work during a part of the pay period and are unemployed or on strike during the rest of the period, are counted as employed. Not counted as employed are persons who are laid off, on leave without pay, or on strike for the entire period, or who are hired but have not reported to work during the period.

## Industry Hours and Earnings

Hours and earnings data are derived from reports of payrolls and man-hours for production and related workers in manufacturing and mining, construction workers in contract construction, and nonsupervisory employees in the remaining nonagriculture components. For Federal

Government, hours and earnings relate to all employees, both supervisory and nonsupervisory. Terms are defined below. When the pay period reported is longer than 1 week, figures are reduced to a weekly basis.

Production and related workers include working foremen and all nonsupervisory workers (including leadmen and trainees) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping, maintenance, repair, janitorial and watchman services, product development, auxiliary production for plant's own use (e.g., power plant), and recordkeeping and other services closely associated with the above production operations.

Construction workers include the following employees In the contract construction division: working foremen, journeymen, mechanics, apprentices, laborers, etc., whether working at the site of construction or in shops or yards, at jobs (such as precutting and preassembling) ordinarily performed by members of the construction trades.

Nonsupervisory employees include employees (not above the working supervisory level) such as office and clerical workers, repairmen, salespersons, operators, drivers, physicians, lawyers, accountants, nurses, social workers, research adds, teachers, draftsmen, photographers, beauticians, musicians, restaurant workers, custodial workers, attendants, linemen, laborers, janitors, watchmen, and similar occupational levels, and other employees whose services are closely associated with those of the employees listed.

Payroll covers the payroll for full- and part-time production, construction, or nonsupervisory workers who received pay for any part of the pay period which includes the 12th of the month. The payroll is reported before deductions of any kind, e.g., for old-age and unemployment insurance, group insurance, withholding tax, bonds, or union dues; also included is pay for overtime, holidays, vacations, and sick leave paid directly by the firm. Bonuses (unless earned and paid regularly each pay period), other pay not earned in pay period reported (e.g., retroactive pay), tips, and the value of free rent, fuel, meals, or other payment in kind are excluded. "Fringe benefits" (such as health and other types of insurance, contributions to retirement, etc. paid by the employer) are also excluded.

Man-hours cover man-hours paid for, during the pay period which includes the 12 th of the month, for production, construction, or nonsupervisory workers. The manhours include hours paid for holidays and vacations, and for sick leave when pay is received directly from the firm.

Overtime hours cover hours worked by production or related workers for which overtime premiums were paid because the hours were in excess of the number of hours of either the straight-time workday or the workweek during the pay period which includes the 12th of the month. Weekend and holiday hours are included only if overtime
premiums were paid. Hours for which only shift differential, hazard, incentive, or other similar types of premiums were paid are excluded.

## Gross Average Hourly and Weekly Earnings

Average hourly earnings are on a "gross" basis, reflecting not only changes in basic hourly and incentive wage rates but also such variable factors as premium pay for overtime and late-shift work and changes in output of workers paid on an incentive plan. Shifts in the volume of employment between relatively high-paid and low-paid work and changes in workers' earnings in individual establishments also affect the general earnings averages. Averages for groups and divisions further reflect changes in average hourly earnings for individual industries.

Averages of hourly earnings differ from wage-rates. Earnings are the actual return to the worker for a stated period of time; rates are the amounts stipulated for a given unit of work or time. The earnings series does not measure the level of total labor costs on the part of the employer since the following are excluded: Irregular bonuses, retroactive items, payments of various welfare benefits, payroll taxes paid by employers, and earnings for those employees not covered under the pro-duction-worker, construction worker, or nonsupervisoryemployee definitions,

Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings. Therefore, weekly earnings are affected not only by changes in gross average hourly earnings but also by changes in the length of the workweek, part-time work, stoppages for varying causes, labor turnover, and absenteeism.

## Average Weekly Hours

The workweek information relates to the average hours for which pay was received and is different from standard or scheduled hours. Such factors as absenteeism, labor turnover, part-time work, and stoppages cause average weekly hours to be lower than scheduled hours of work for an establishment. Group averages further reflect changes in the workweek of component industries.

## Average Overtime Hours

The overtime hours represent that portion of the gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid. If an employee worked on a paid holiday at regular rates, receiving as total compensation his holiday pay plus straight-time pay for hours worked that day, no overtime hours would be reported.

Since overtime hours are premium hours by definition, gross weekly hours and overtime hours do not necessarily move in the same direction from month-tomonth; for example, overtime premiums may be paidfor hours in excess of the straight-time workday although less than a full week is worked. Diverse trends at the in-dustry-group level also may be caused by a marked change
in gross hours for a component industry where little or no overtime was worked in both the previous and current months. In addition, such factors as stoppages, absenteeism, and labor turnover may not have the same influence on overtime hours as on gross hours.

## Hours and Farnings For Total Private Nonagricultural

 InciustriesThis series covers all nonagricultural industry divisions except government. The principal source of payroll data is Form BLS 790. Secondary source material such as Employment and Wages (Bureau of Employment Security), County Business Patterns (Bureau of the Census), and additional supporting information such as The Hospital Guide, Part II, of the American Hospital Association and special studies by thic National Council of Churches supplement data for certain industry groups within the service division.

For a technical description of this series, see the article, "Hours and Earnings for Workers in Private Nonagricultural Industries," published in the May 1967 issue of Employment and Earnings and Monthly Report on the Labor Force.

## Railroad Hours and Earnings

The figures for class I railroads (excluding switching and terminal companies) are based on monthly data summarized in the M-300 report of the Interstate Commerce Commission and relate to all employees except executives, officials, and staff assistants (ICC group I) who received pay during the month. Gross average hourly earnings are computed by dividing total compensation by total hours paid for. Average weekly hours are obtained by dividing the total numberof hours paid for, reduced to a weekly basis, by the number of employees, as defined above. Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings.

## Spendable Average Weekly Earnings

Spendable average weekly earnings in current dollars are obtained by deducting estimated Federal social security and income taxes from gross weekly earnings. The amount of income tax liability depends on the number of dependents supported by the worker and his marital status, as well as on the level of his gross income. To reflect these variables, spendable earnings are computed for a worker with no dependents and a married worker with three dependents. The computations are based on gross average weekly earnings for all production or nonsupervisory workers in the industry division excluding other income and income earned by other family members.
"Real" earnings are computed by dividing the current Consumer Price Index into the earnings averages for the current month. The level of earnings is thus adjusted for changes in purchasing power since the base period (1957-59).

## Average Hourly Earnings Excluding Overtime

Average hourly earnings excluding overtime premium pay are computed by dividing the total productionworker payroll for the industry group by the sum of total production-worker man-hours and one-half of total overtime man-hours. Prior to January 1956, these data were based on the application of adjustment factors to gross average hourly earnings (as described in the Monthly Labor Review, May 1950, pp. 537-540). Both methods eliminate only the earnings due to overtime paid for at $1 \frac{1}{2}$ times the straight-time rates. No adjustment is made for other premium payment provisions, such as holiday work, late-shift work, and overtime rates other than time and one-half.

## Indexes of Aggregate Weekly Payralls and Man-Hours

The indexes of aggregate weekly payrolls and manhours are prepared by dividing the current month's aggregate by the monthly average for the 1957-59 period. The man-hour aggregates are the product of average weekly hours and production-worker employment, and the payroll aggregates are the product of gross average weekly earnings and production-worker employment.

## Labor Turnover

Labor turnover is the gross movement of wage and salary workers into and out of employed status with respect to individual establishments. This movement, which relates to a calendar month, is divided into two broad types: Accessions (new hires and rehires) and separations (terminations of employment initiated by either employer or employee). Each type of action is cumulated for a calendar month and expressed as a rate per 100 employees. The data relate to all employees, whether full- or part-time, permanent or temporary, including executive, office, sales, other salaried personnel, and production workers. Transfers to another establishment of the company are included, beginning with January 1959.

Accessions are the total number of permanent and temporary additions to the employment roll, including both new and rehired employees.

New hires are temporary or permanent additions to the employment roll of persons who have never before been employed in the establishment (except employees transferring from another establishment of the same company) or of former employees not recalled by the employer.

Other accessions, which are not publishedseparately but are included in total accessions, are all additions to the employment roll which are not classified as new hires, including transfers from another establishment of the company.

Separations are terminations of employment during the calendar month and are classified according to cause: Quits, layoffs, and other separations, are đefined as follows:

Quits are terminations of employment initiated by employees, failure to report after being hired, and unauthorized absences, if on the last day of the month the person has been absent more than 7 consecutive calendar days.

Layoffs are suspensions without pay lasting or expected to last more than 7 consecutive calendar days, initiated by the employer without prejudice to the worker.

Other separations, which are not published separately but are included in total separations, are terminations of employment because of discharge, permanent disability, death, retirement, transfers to another establishment of the company, and entrance into the Armed Forces for a period expected to last more than 30 consecutive calendar days.

## Relationship to Employment Series

Month-to-month changes in total employment in manufacturing industries reflected by labor turnover rates are not comparable with the changes shown in the Bureau's employment series for the following reasons: (1) Accessions and separations are computed for the entire calendar month; the employment reports refer to the pay period which includes the 12 th of the month; and (2) employees on strike are not counted as turnover actions although such employees are excluded from the employment estimates if the work stoppage extends through the report period.

## ESTIMATING METHODS

The principal features of the procedure used to estimate employment for the industry statistics are (1) the use of the "link relative" technique, which is a form of ratio estimation, (2) periodic adjustment of employment levels to new benchmarks, and (3) the use of size and regional stratification.

## The "Link Relative" Technique

From a sample composed of establishments reporting for both the previous and current months, the ratio of current month employment to that of the previous month is computed. This is called a link relative. The estimates of employment (all employees, including production and nonproduction workers together) for the current month are obtained by multiplying the estimates for the previous month by these "link relatives. In addition, small bias correction factors are applied to selected employment estimates each month. The size of the bias correction factors is determined from past experience. Other features of the general procedures are described later in the table, Summary of Methods for Computing Industry Statistics on Employment, Hours, Earnings, and Labor Turnover. Further details are given in the technical notes on Measurement of Employment, Hours, and Earnings in Non-agricultural Industries and on Measurement of $L$ abor $T$ urnover, which are available upon request.

## Size and Regional Stratification

A number of industries are stratified by size of establishment and/or by region, and the stratified produc-
tion- or nonsupervisory-worker data are used to weight the hours and earnings into broader industry groupings. Accordingly, the basic estimating cell for an employment, hours, or earnings series, as the term is used in the summary of computational methods, may be a whole industry or a size stratum, a region stratum, or a size stratum of a region within an industry.

## Benchmark Adjustments

Employment estimates are compared periodically with comprehensive counts of employment which provide "benchmarks" for the various nonagricultural industries, and appropriate adjustments are made as indicated. The industry estimates are currently projected from March 1967 levels. Normally, benchmark adjustments are made annually.

The primary sources of benchmark information are employment data, by industry, compiled quarterly by State agencies from reports of establishments covered under State unemployment insurance laws. These tabulations, covering three-fourths of the total nonagricultural employment in the United States, are prepared under the direction of the Bureau of Employment Security. Benchmark data for the residual are obtained from the records of the Social Security Administration, the Interstate Commerce Commission, and a number of other agencies in private industry or government.

The estimates relating to the benchmark month are compared with new benchmark levels, industry by industry. If revisions are necessary, the monthly series of estimates are adjusted between the new benchmark and the preceding one, and the new benchmark for each industry is then carried forward progressively to the current month by use of the sample trends. Thus, under this procedure, the benchmark is used to establish the level of employment; the sample is used to measure the month-to-month changes in the level. A comparison of the actual amounts of revisions made in the last 3 benchmark years follows:

Nonagricultural payroll employment estimates, by industry division, as a percentage of the benchmark for 1965-67

| Industry division | 1965 | 1966 | 1967 |
| :---: | ---: | ---: | ---: |
| Total . . . . . . . . . . . . . . . . . | 99.5 | 99.9 | 100.0 |
| Mining . . . . . . . . . . . | 99.5 | 100.5 | 99.5 |
| Contract construction . . . . . | 100.9 | 99.7 | 101.6 |
| Manufacturing . . . . . . . . | 99.8 | 99.4 | 99.5 |
| Transportation and public |  |  |  |
| utilities . . . . . . . . . . . | 100.1 | 99.7 | 99.8 |
| Wholesale and retail trade . . . | 98.4 | 100.1 | 100.7 |
| Finance, insurance, and |  |  |  |
| real estate . . . . . . . . . . | 100.7 | 99.5 | 100.2 |
| Services . . . . . . . . . . . . | 97.9 | 100.3 | 99.8 |
| Government. . . . . . . . . . . | 99.8 | 100.0 | 100.0 |

Data for all months since the last benchmark to which the series has been adjusted are subject to revision. To provide users of the data with a convenient reference source for the revised data, the BLS publishes as soon as possible after each benchmark revision a summary volume of employment, hours, earnings, and labor turnover statistics.

## THE SAMPLE

## Design

The sampling plan used in the current employment statistics program is known as "sampling proportionate to average size of establishment." This design is an optimum allocation design among strata since the sampling variance is proportional to the average size of establishments. The universe of establishments is stratified first by industry and then within each industry by size of establishment in terms of employment. For each industry, the number of sample units is distributed among the size class cells on the basis of average employment per establishment in each cell. In practice, this is equivalent to distributing the predetermined total number of establishments required in the sample among the cells on the basis of the ratio of employment in each cell to total employment in the industry. Within each noncertainty stratum the sample members are selected at random.

Under this type of design, large establishments fall into the sample with certainty. The size of the samples for the various industries is determined empirically on the basis of experience and of cost considerations. In a manufacturing industry in which a high proportion of total employment is concentrated in relatively few establishments, a large percentage of total employment is included in the sample. Consequently, the sample design for such industries provides for a complete census of the larger establishments with only a few chosen from among the smaller establishments or none at all if the concentration of employment is great enough. On the other hand, in an industry in which a large proportion of total employment is in small establishments, the sample design calls for inclusion of all large establishments and also for a substantial number of the smaller ones. Many industries in the trade and service divisions fall into this category. To keep the sample to a size which can be handled by available resources, it is necessary to accept samples in these divisions with a smaller proportion of universe employment than is the case for most manufacturing industries. Since individual establishments in these nonmanufacturing divisions generally show less fluctuation from regular cyclical or seasonal patterns than establishments in manufacturing industries, these smaller samples (in terms of employment) generally produce reliable estimates.

In the context of the BLS employment and labor turnover statistics programs, with their emphasis on pro-
ducing timely data at minimum cost, a sample must be obtained which will provide coverage of a sufficiently large segment of the universe to provide reasonably reliable estimates that can be published promptly and regularly. The present sample meets these specifications for most industries. With its use, the BLS is able to produce preliminary estimates each month for many industries and for many geographic levels within a few weeks after reports are mailed by respondents, and at a somewhat later date, statistics in considerably greater industrial detail.

## Coverage

The BLS sample of establishment employment and payrolls is the largest monthly sampling operation in the field of social statistics. The table that follows shows the approximate proportion of total employment in each industry division covered by the group of establishments furnishing monthly employment data. The coverage for individual industries within the division may vary from the proportions shown.

Approximate size and coverage of BLS employment and payrolls sample, March $1967^{1}$

| Industry division | Number of establishments in sample | Employees |  |
| :---: | :---: | :---: | :---: |
|  |  | Number reported | $\begin{array}{\|l} \text { Per- } \\ \text { cent } \\ \text { of } \\ \text { total } \end{array}$ |
| Mining | 2,300 | 294,000 | 48 |
| Contract construction | 15,400 | 674,000 | 23 |
| Manufacturing | 44,200 | 12,285,000 | 63 |
| Transportation and public utilities: |  |  |  |
| Railroad transportation (ICC) . . . . . . . . . . . . . | 100 | 661,000 | 95 |
| Other transportation and public utilities. . . . . . . | 7,000 | 1,943,000 | 55 |
| Wholesale and retail trade. | 39,300 | 2,585,000 | 20 |
| Finance, insurance and real estate. . . . . . . . | 9,100 | 1,129,000 | 36 |
| Services. | 20,800 | 2,064,000 | 21 |
| Government: |  |  |  |
| Federal (Civil Service Commission) ${ }^{2}$. . . . . . . | 3,100 | 2,669,000 | 100 |
| State and local | 9,000 | 4,749,000 | 53 |

${ }^{1}$ Since a few establishments do not report payroll and man-hour information, hours and earnings estimates may be based on a slightly smaller sample than employment estimates.
${ }^{2}$ State and area estimates of Federal employment are based on reports from a sample of Federal establishments, collected through the BLS-State cooperative program.

The table below shows the approximate coverage, in terms of employment, of the labor turnover sample.

Approximate size and coverage of BLS labor turnover sample, March 1967

| Industry | Employees |  |
| :---: | ---: | :---: |
|  | Number <br> reported | Percent <br> of total |
| Manufacturing . . . . . . | $11,497,100$ | 59 |
| Metal mining. . . . . . | 60,400 | 70 |
| Coal mining. . . . . . | 64,400 | 46 |
| Communication: |  |  |
| Telephone . . . . . . | 639,000 | 80 |
| Telegraph . . . . . . | 23,100 | 70 |

## Reliability of the Employment Estimates

The estimates derived from the establishment survey may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures. The relatively large size of the BLS establishment sample assures a high degree of accuracy. However, since the link relative technique requires the use of the previous month's estimate as the base in computing the current month's estimate, small sampling and response errors may cumulate over several months. To remove this accumulated error, the estimates are adjusted annually to new benchmarks. In addition to the sampling and response errors, the benchmark revision adjusts the estimates for changes in the industrial classification of individual establishments (resulting from changes in their product which are not reflected in the levels of estimates until the data are adjusted to new benchmarks.). In fact, at the more detailed industry levels, particularly within manufacturing, changes in classification are the major cause of benchmark adjustments. Another cause of differences, generally minor, arises from improvements in the quality of the benchmark data. (A detailed description of the March 1967 benchmark is available from the Bureau upon request.)

One measure of the reliability of ratio estimates is the root mean square error (RMSE). This measure is the standard deviation adjusted for the bias in ratio estimates $\left(\right.$ RMSE $=\sqrt{\left(\text { Standard Deviation) }{ }^{2}+(\text { Bias })^{2}\right)}$. If the bias is small, the chances are about 2 out of 3 that an estimate from the sample would differ from its benchmark by less than the root mean square error. The chances are about 19 out of 20 that the difference would be less than twice the root mean square error.

Approximations of the root mean square errors (based on the experience of the last several years) of differences between final estimates and benchmarks are presented in the following table.

Root-mean-square errors of differences
between benchmarks and estimates

| Size of employment <br> estimate | Root-mean-square <br> error $^{1}$ |
| :---: | :---: |
| 50,000 | 2,200 |
| 100,000 | 2,400 |
| 200,000 | 4,300 |
| 500,000 | 7,000 |
| $1,000,000$ | 11,800 |
| $2,000,000$ | 19,600 |

${ }^{1}$ Assuming 12 -month intervals between benchmark revisions.

For the most recent months, estimates of employment, hours, and earnings are preliminary and are so footnoted in the tables. These figures are based on less than the total sample and are revised when all the reports in the sample have been received. The table below presents root-mean-square-errors of the amounts of

Errors of preliminary employment estimates

| Size of empl. <br> estimate | Root-mean-square error of |  |
| :---: | :---: | :---: |
|  | Monthly level | Month-to-month <br> change |
| 50,000 | 600 | 500 |
| 100,000 | 1,100 | 1,000 |
| 200,000 | 1,800 | 1,500 |
| 500,000 | 2,500 | 2,400 |
| $1,000,000$ | 3,700 | 3,500 |
| $2,000,000$ | 7,000 | 7,000 |
| $10,000,000$ | 24,900 | 23,500 |
| Total Nonag. empl. | 78,000 | 68,000 |

revision that may be expected between the preliminary and final levels of employment and preliminary and final month-to-month changes. Revisions of preliminary hours and earnings estimates are normally not greater than .l of an hour for weekly hours or 1 cent for hourly earnings.

## STATISTICS FOR STATES AND AREAS

State and area employment, hours, earnings, and labor turnover data are collected and prepared by State agencies in cooperation with BLS. The area statistics relate to metropolitan areas. Definitions for all areas are published each year in the issue of Employment and Earnings andMonthly Report on the Labor Force that contains State and area annual averages (usually the May issue). Changes in definitions are noted as they occur. Additional industry detail may be obtained from the State agencies listed on the inside back cover of each issue. These statistics are based on the same establishment reports used by BLS for preparing national estimates. For employment, the sum of the State figures may differ slightly from the equivalent official U.S. totals on a national basis, because some States have more recent benchmarks than others and because of the effects of differing industrial and geographic stratification.

For the States and the areas shown in the $B$ and $C$ sections of this periodical, all the annual average data for the detailed industry statistics currently published by each cooperating State agency are presented (from the earliest date of availability of each series) in a summary volume published annually by the BLS.

## UNEMPLOYMENT INSURANCE DATA

Insured unemployment represents the number of persons reporting a week of unemployment under an unemployment insurance program. It includes some persons who are working part time who would be counted as employed in the payroll and household surveys. Excluded are persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (agriculture, State and local government, domestic service, self-employment, unpaid family work, nonprofit organizations, and firms below a minimum size). The rate of insured unemployment is the number of insured unemployed expressed as a percent of average covered employment in a 12 -month period ending 6 to 8 months prior to the week of reference. Initial
claims are notices filed by those losing jobs covered by an unemployment insurance program that they are starting a period of unemployment. A claimant who continues to be unemployed a full week is then counted in the insured unemployment figure.

Because of differences in State laws and procedures under which unemployment insurance programs are operated, State unemployment rates generally indicate, but do not precisely measure, differences among the individual States. Persons wishing to receive a detailed description of the nature, sources, inclusions and exclusions, and limitations of unemployment insurance data should address their inquiries to Bureau of Employment Security, Washington, D.C.

Many economic statistics reflect a regularly recurring seasonal movement which can be estimated on the basis of past experience. By eliminating that part of the change which can be ascribed to usual seasonal variation, it is possible to observe the cyclical and other nonseasonal movements in the series. However, in evaluating deviations from the seasonal pattern--that is, changes in a seasonally adjusted series--it is important to note that seasonal adjustment is merely an approximation based on past experience. Seasonally adjusted estimates have a , broader margin of possible error than the original data on which they are based, since they are subject not only to sampling and other errors but, in addition, are affected by the uncertainties of the seasonal adjustment process itself. Seasonally adjusted series for selected labor force and establishment data are published regularly in Employment and Earnings and Monthly Report on the Labor Force.

The seasonal adjustment method used for these series is an adaptation of the standard ratio-to-moving average method, with a provision for "moving" adjustment factors to take account of changing seasonal patterns. A detailed description of the method is given in the booklet, The BLS Seasonal Factor Method (1966), which may be obtained from the Bureau on request.

For establishment data, the seasonally adjusted series on weekly hours and labor turnover rates for industry groupings are computed by applying factors directly to the corresponding unadjusted series. However, seasonally adjusted employment totals for all employees and production workers by industry division are obtained by summing seasonally adjusted data for the component industries. Indexes of aggregate weekly man-hours, seasonally adjusted, for mining, contract construction, and the major industries in manufacturing are obtained by multiplying average weekly hours, seasonally adjusted, by production workers, seasonally adjusted, and dividing by the 1957-59 base. For total, manufacturing, and durable and nondurable goods, the indexes of aggregate weekly man-hours, seasonally adjusted, are obtained by summing the aggregate weekly man-hours, seasonally adjusted, for the appropriate component industries and dividing by the 1957-59 base.

The seasonally adjusted establishment data for Federal Government are based on a series which excludes the Christmas temporary help employed by the Post Office Department in December. The employment of these workers constitutes the only significant seasonal change in Federal Government employment during the winter months. Furthermore, the volume of such employment may change substantially from year to year because of administrative decisions by the Post Office Department. Hence, it was considered desirable to exclude this group from the data upon which the seasonally adjusted series is based. Factors currently in use for the establishment data are shown in the June $1.968^{\circ}$ Employment and Eamings and Monthly Report on the Labor Force, and revisions will be made coincidental with the adjustment of series to new benchmark levels.

For each of the three major labor force components-agricultural and nonagricultural employment and unem-ployment--data for four age-sex groups (male and female workers under age 20 and age 20 and over) are separately adjusted for seasonal variation and are then added to give seasonally adjusted total figures, In order to produce seasonally adjusted total employment and civilian labor force data, the appropriate series are aggregated. The seasonally adjusted rate of unemployment is derived by dividing the seasonally adjusted figure for total unemployment (the sum of four seasonally adjusted age-sex components) by the figure for the seasonally adjusted civilian labor force (the sum of twelve seasonally adjusted age-sex components).

The seasonal adjustment factors applying to current data are based on a pattern shown by past experience. These factors are revised in the light of the pattern revealed by subsequent data. Revised seasonally adjusted series for major components of the labor force based on, data through December 1967 are published in the February 1968 Employment and Earnings and Monthly Report on the LaborF orce. Revisions will be made annually as each additional year's data become available.

## ATTENTION

As discussed in the Technical Note, the Bureau periodically adjusts the industry employment series to a recent benchmark to improve their accuracy. These adjustments may also affect the hours and earnings series because employment levels are used as weights. Industry data for all national series shown in this report have been adjusted to March 1967 benchmarks. Data from April 1967 forward are subject to revision at the time of the next benchmark.

Beginning with the June 1968 and subsequent issues of Employment and Earnings and Monthly Report on the Labor Force, the national data in sections B, C, and D supersede those published in previous issues, as well as those appearing in the Handbook of Labor Statistics, 1968. Comparable data are published in Employment and Earnings Statistics for the United States, 1909-68, BLS Bulletin 1312-6.

# Summary of Methods for Computing Industry Statistics <br> Employment, Hours, Earnings, and Lahor Turnover 

| Item | Basic estimating cells (industry, region, size, or region/size cell) | Aggregate industry levels (divisions, groups and, where stratified, individual cells) |
| :---: | :---: | :---: |
|  | Monthly Data |  |
| All employees | All-employee estimate for previous month multiplied by racio of all employees in current month to all employees in previous month, for sample establishments which reported for both months. | Sum of all-employee estimates for component cells. |
| Production or nonsupervisory workers; women employees. | All-employee estimate for current month multi plied by (1) ratio of production or nonsupervisory workers to all employees in sample establishments for current month, (2) ratio of women to all employees. | Sum of production- or nonsupervisory-worker estimates, or estimates of women employees, for component cells. |
| Gross average weekly hours . | Production- or nonsupervisory-worker man-hours divided by number of production or nonsupervisory workers. | Average, weighted by production- or nonsuper-visory-worker employment, of the average weekly hours for component cells. |
| Average weekly overtime hours . | Production-worker overtime man-hours divided by number of production workers. | Average, weighted by production-worker employment, of the average weekly overtime hours for component cells. |
| Gross a verage hourly earnings | Total production-or nonsupervisory-worker payroll divided by total production- or nonsuper-visory-worker man-hours. | Average, weighted by aggregate man-hours, of the average hourly earnings for component cells. |
| Gross average weekly earnings. . | Product of gross average weekly hours and average hourly earnings. | Product of gross average weekly hours and average hourly earnings. |
| Labor curnover rates (cocal, men, and women). | The number of particular actions (e.g., quits) in reporting firms divided by total employment in those firms. The result is multiplied by 100. For men (or women), the number of men (women) who quit is divided by the total number of men (women) employed. | Average, weighted by employment, of the rates for component cells. |
|  | Annual Average Data |  |
| All employees and production or nonsupervisory workers. | Sum of monthly estimates divided by 12. | Sum of monthly estimates divided by 12. |
| Gross average weekly hours | Annual total of aggregate man-hours (productionor nonsupervisory-worker employment multiplied by average weekly hours) divided by annual sum of employment. | Annual total of aggregate man-hours for production or nonsupervisory workers divided by annual sum of employment for these workers. |
| Average weekly overrime hours | Annual cotal of aggregate overtime man-hours (production-worker emp'oyment multiplied by average weekly overtime hours) divided by annual sum of employment. | Annual total of aggregate overtime manhours for production workers divided by annual sum of employment for these workers. |
| Gross average hourly earnings | Annual total of aggregate payrolls (productionor nonsupervisory-worker employment multiplied by weekly earnings) divided by annual aggregace man-hours. | Annual total of aggregate payrolls divided by annua aggregate man-hours. |
| Gross average weekly earnings . . | Product of gross average weekly hours and average hourly earnings. | Product of gross average weekly hours and average hourly earnings. |
| Labot turnover rates. . | Sum of monthly rates divided by 12. | Sum of monthly rates divided by 12. |
