EMPLOYMENT AND UNEMPLOYMENT HIGHLIGHTS

May 1961

THE MONTHLY REPORT ON THE LABOR FORCE: MAY 1961

Nonfarm employment rose sharply between April and May, continuing the uptrend which began a month earlier. The detailed statistics on the employment situation for May showed a strong pickup in heavy industry. At the same time, however, both total and long-term unemployment remained at high levels.

The number of workers on nonfarm payrolls rose by 500,000 over the month to 52.5 million, almost double the usual rise for May. Of particular significance was a sharp job increase of nearly 150,000 in the durable goods manufacturing sector, where employment had fallen by almost 900,000 from February 1960 to March 1961. The largest gains between April and May were in the steel and auto industries and in fabricated metal plants supplying components to the automobile industry, but there were increases throughout hard-goods manufacturing. There was no change in nondurable manufacturing.

Total manufacturing employment--which normally shows a small decline in May--rose by 150,000 over the month to 15.7 million but was still well below the level of a year ago. Aside from gains in hard-goods manufacturing, nonfarm employment increases were largely seasonal, occurring in construction, service, and trade.

The workweek of factory production workers also moved up more than seasonally, from 39.3 hours in April to 39.6 hours in May. As in April, the strongest pickup occurred in the durable goods sector. The factory workweek has now moved upward for four months in a row, after allowance for normal seasonal variation, for a total gain of 0.8 hour, but the workweek was still 0.3 hour below a year ago. With the increase in hours and a 1-cent increase in hourly earnings, weekly earnings of factory workers were up to \$92.66 in May, \$1.09 more than the month before and more than \$2 higher than in January.

As reported on May 31, the number of unemployed persons fell seasonally by 200,000 over the month to 4.8 million in May. The seasonally adjusted rate of unemployment--6.9 percent in May--maintained approximately the same level for the 6th straight month. In May 1960, when there were 1.3 million fewer jobless workers, the seasonally adjusted rate was 5.1 percent.

Insured unemployment under regular State programs fell sharply by 450,000 to 2.4 million between April and May. In addition, there were 700,000 jobless workers receiving benefits under the Temporary Extended Unemployment Compensation program.

The number out of work 15 weeks or longer also declined seasonally to 1.9 million, but was at a postwar high for May. There continued to be 900,000 among the long-term unemployed who had been without jobs for more than half a year.

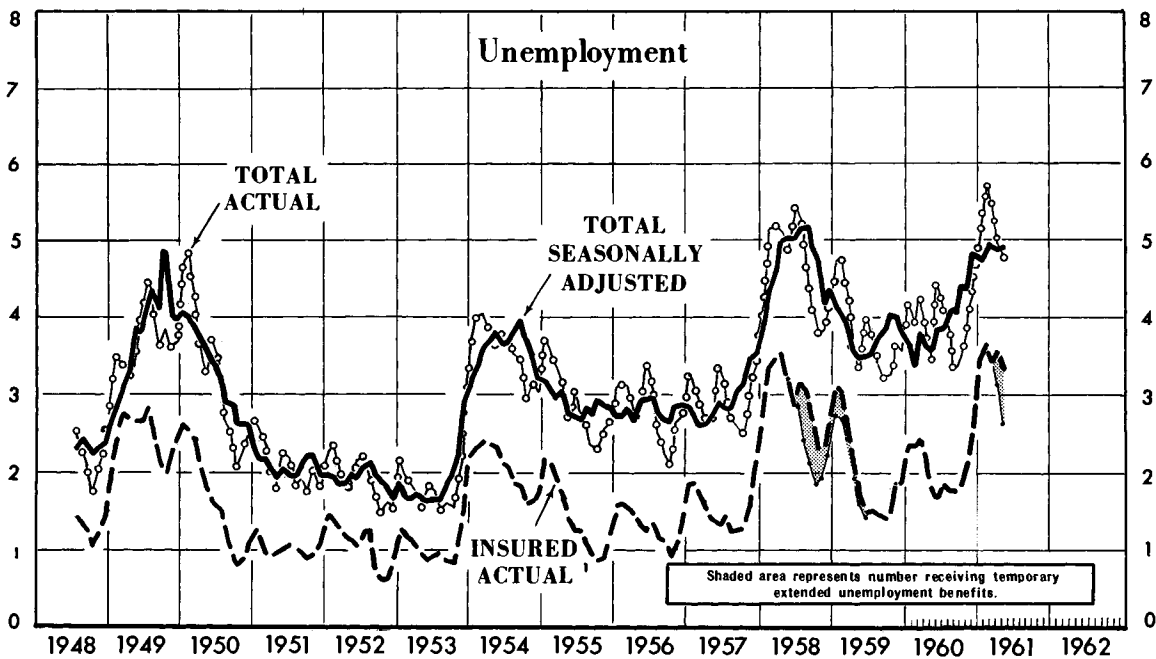

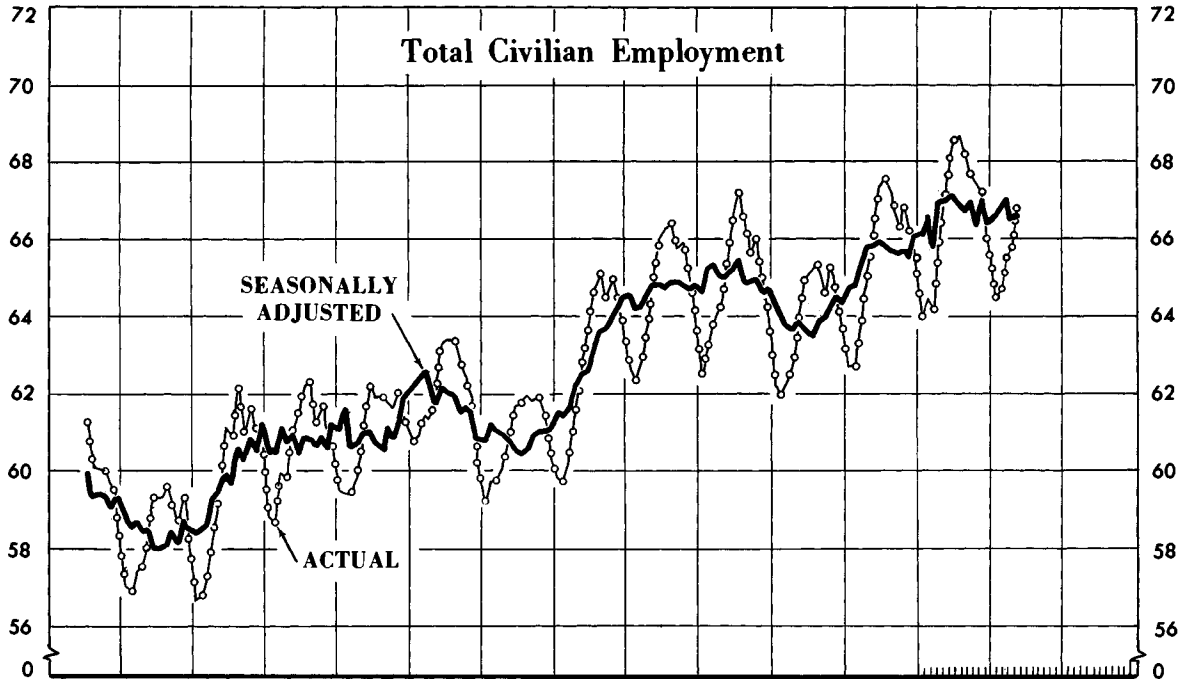

TRENDS IN EMPLOYMENT AND UNEMPLOYMENT

Actual and Seasonally Adjusted

July 1948 to Date

MILLIONS OF PERSONS

MILLIONS OF PERSONS

¹ Insured under following programs: State unemployment insurance, unemployment compensation for Federal employees, veterans, ex-servicemen, railroad workers (RRB) and temporary programs.

Beginning in January 1960, data include Alaska and Hawaii

Total employment climbed by 1 million to 66.8 million in May; however, the job total was still 400,000 below a year ago. About half of the gain over the month was in agriculture. Among the employed in May were 2.8 million nonfarm workers on part time for economic reasons, down 150,000 from the month before, but one-half million more than a year earlier.

Nonfarm Payroll Employment

Aside from gains in manufacturing, the largest employment increases in May were in construction, service, and trade. Employment in construction rose by about 150,000 over the month; this was somewhat under the normal May rise, but it followed 2 months of better-than-seasonal gains. In service and trade, the increases of 70,000 and 50,000, respectively, were approximately seasonal.

In manufacturing, where the most significant increase occurred, nearly all hard-goods industries showed better-than-seasonal gains; the largest occurred in steel and autos, and in the industries engaged in making stampings, hardware and electrical equipment for vehicles.

In the soft-goods sector, the normal seasonal cutbacks did not take place. However, in the apparel industry, a more moderate decline than is normal for May appeared to reflect the new seasonal pattern in employment which has been emerging in the past few years.

Despite the encouraging employment gains during the past 2 months, there were about 650,000 fewer nonfarm jobs in May than a year ago. Especially large losses had occurred among production workers in manufacturing, mainly in primary and fabricated metals, machinery, and automobiles.

Employment in nonmanufacturing industries showed sharply different developments over the year. Transportation was down by 140,000, trade by 120,000, construction by 75,000 and mining by 45,000. The drop in transportation and mining reflected job cutbacks induced by the recession and a continuation of the long-term decline. Employment in construction has shown no clear trend during the past year. The decline in trade employment, although small in relation to the number employed in that industry, was in marked contrast to the sharp growth in jobs generally shown in trade during the postwar period.

By comparison with these losses, employment in State and local government continued to grow (up 310,000 over the year) and there was a rise of 90,000 in finance and service.

Factory Hours and Earnings

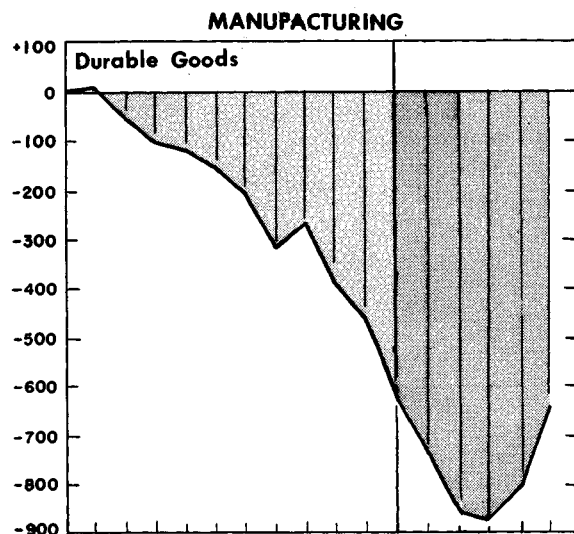

The workweek of factory production workers increased more than seasonally, rising by 0.3 hour to 39.6 in May. This gain occurred mainly in the durable goods sector, sparked by longer workweeks in steel, and in auto and auto supplier plants. Textile mills also reported significant gains in hours of work. Since January, the workweek has risen by 0.8 hour on a seasonally adjusted basis, but was still 0.3 hour below May a year ago. The decline from a year ago was represented entirely by reduced overtime work.

CHANGES IN NONFARM PAYROLL EMPLOYMENT FROM JANUARY 1960

Seasonally Adjusted

Change from January
(IN THOUSANDS)

Change from January
(IN THOUSANDS)

Data for last two months are preliminary.

With the May increase in hours of work and a 1-cent increase in hourly earnings, weekly earnings of factory production workers rose by \$1.09 over the month to \$92.66 in May. Compared with May 1960, weekly earnings were \$1.29 higher because the 0.3-hour decline in the workweek was more than offset by a 5-cent rise in hourly earnings.

Earnings in the durable goods sector averaged \$2.50 per hour for the first time in May. With the increase over the month both in hourly earnings and in the workweek, gross weekly earnings in durable goods once again rose above \$100. Although a number of individual industries have reported earnings of more than \$100 per week, only once before has the average for all durable goods industries reached this mark--in January 1960, when hourly earnings were 4 cents lower and the workweek was 0.9 hour larger.

Unemployment

Age and sex. Reemployment of adult men continued to account for most of the usual spring decline in unemployment. The changes over the month were mainly seasonal for both men and women in most age groups, as they have been since last December. However, unemployment rates in all age brackets remained substantially above those for May 1960. Increases were particularly large for adult men and women.

There were 1.7 million married men among the unemployed in May 1961, 35 percent of the jobless total. Their number has been reduced by 700,000 since February, accounting for three-fourths of the overall decline in unemployment. However, their unemployment rate was still much higher than a year ago--4.5 percent as against 3.1 percent in May 1960.

In addition, there were 700,000 widowed, divorced and separated workers unemployed and 800,000 adult single men and women without jobs. These groups, together with the married men, constituted two-thirds of the unemployed in May 1961.

Industry of last job. Unemployment rates dropped over the month in construction and other outdoor activities. At the same time, the recovery in hard goods brought unemployment rates down in several industries, notably steel and autos. However, in May, 1 out of every 8 steel and auto workers was still unemployed, a much higher proportion than a year earlier.

Duration of unemployment. Long-term unemployment (the number out of work 15 weeks or longer) was still at a very high level--1.9 million-- in May, although there was a seasonal decline of 200,000 between April and May. No net change occurred in the number with less than 15 weeks of unemployment. As in April, 900,000 of the long-term jobless had been out of work 6 months or more.

Over the course of the 1960-61 economic downturn, long-term unemployment roughly doubled as compared with a threefold increase during the comparable period of the 1957-58 recession. Seasonally adjusted, long-term unemployment as a percent of total unemployment climbed from 21.6 percent last August to 33.0 percent in May. This rate had reached a postwar high of 37.8 percent in November 1958. Improvement in long-term unemployment usually lags behind an upturn in the business situation, since drops in the number of new layoffs and lengthening hours of work for those still employed usually precede rehiring of unemployed workers.

THE FACTORY WORKWEEK IN THREE RECESSIONS

SEASONALLY ADJUSTED

Average Weekly Hours

* Workweek affected by unusually severe weather.

SEASONALLY ADJUSTED UNEMPLOYMENT RATE

July 1948 to Date

Percent of Civilian Labor Force

Beginning in January 1980, data include Alaska and Hawaii.

About half of all jobless blue-collar workers were among the long-term unemployed in May, as compared with one-third of those last employed in white-collar or service jobs. In addition, the blue-collar workers had shown by far the greatest increases in long-term unemployment since last May.

Insured Unemployment

Insured unemployment under regular State programs moved down by 450,000 between April and May to 2.4 million. There were continued seasonal expansions in trade, construction, and other outdoor work. In addition, further recalls to work in many durable goods industries, particularly metal and metal-using industries, contributed to the decline. Part of the drop in the number of insured jobless was due to the exhaustion of benefit rights by claimants; the number of exhaustions rose from 230,000 in April to an estimated 250,000 in May compared with 140,000 during the same month in 1960.

The number of jobless workers who had exhausted their State benefit rights and were insured under the Temporary Extended Unemployment Compensation program (TEC) rose from 415,000 in mid-April to 700,000 in mid-May. At the end of May, when the program had been in operation for 7 weeks, the number receiving benefits under TEC was 725,000.

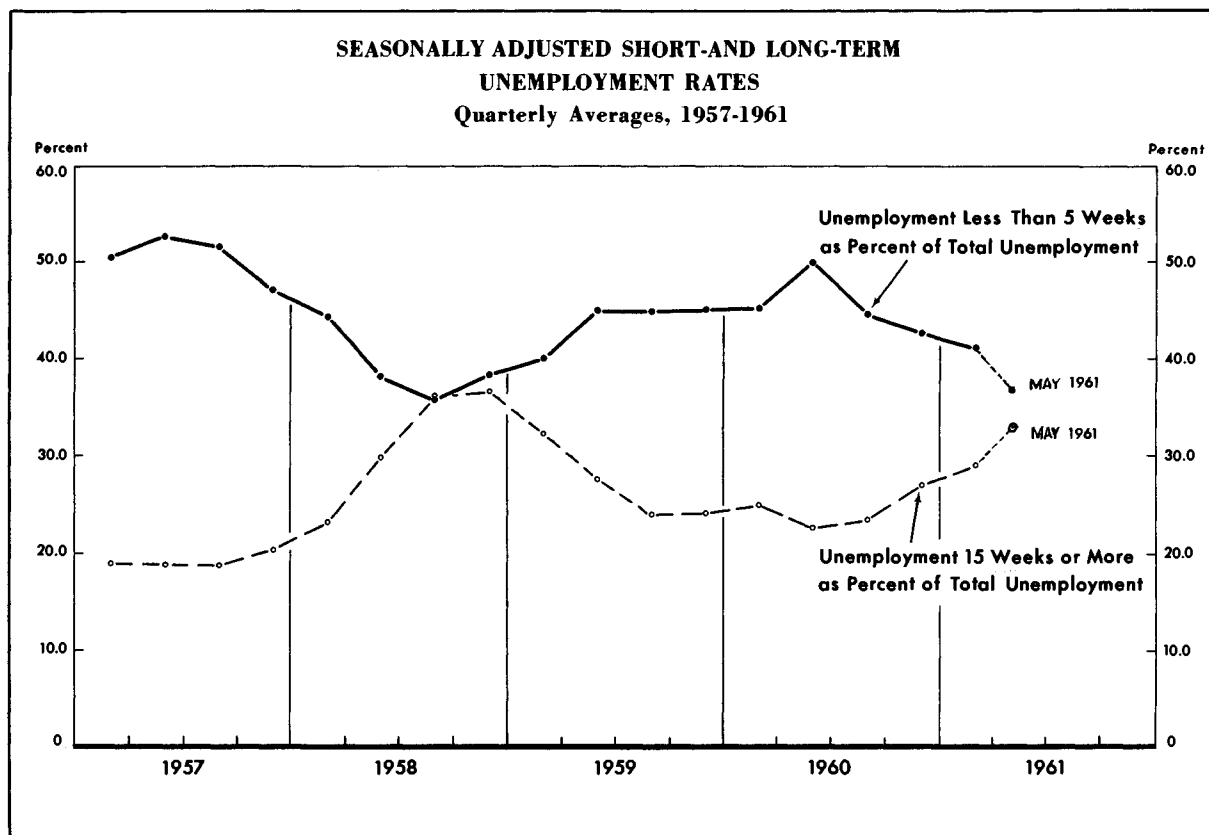

Regular insured unemployment declined in all States over the month, with the largest reductions in Michigan (55,000), Ohio (40,000), New York (35,000), and Pennsylvania (35,000). Reduced joblessness in the auto and primary and fabricated metal industries accounted for one-half the decline in Michigan. Ohio and Pennsylvania also noted sizable recalls in metals as well as less joblessness among transportation equipment and machinery workers. New York reported a sizable pickup in construction activities and some improvement in the metal and service industries but also noted seasonal cutbacks in apparel plants.

The rate of insured unemployment for the Nation (not adjusted for seasonality) declined from 7.0 percent in April to 5.9 percent in May. Two States had rates of more than 10 percent--Alaska (13.6) and Maine (10.2 percent)--compared with seven in the preceding month. Among the eight other States with rates in excess of 7.0 percent were Kentucky (9.7 percent), West Virginia (8.9 percent), Pennsylvania (8.2 percent), and Michigan (7.2 percent). Four other large industrial States--California, New Jersey, New York, and Ohio--had rates ranging from 6.1 to 6.8 percent, while those in Illinois and Texas were 4.5 and 3.5 percent, respectively.

Total Employment

About half of the 500,000 increase in total nonagricultural employment over the month occurred among teenage boys, many of whom began working at odd jobs. As expected for May, the number of adult men holding nonfarm jobs showed a moderate rise over the month. The 61.2 million total employed in nonagricultural industries (including the self-employed, domestics, and unpaid family workers) was not significantly changed from the May 1960 level.

The gain in farm employment was in line with the April-May increase which usually takes place as farm activity builds up to peak summer levels. However, normal spring farm work had been held back by unusually bad weather earlier this year and has not yet made up for those delays. Partly as a result, agricultural employment is now about 300,000 below the May 1960 level.

Full-time and Part-time Employment

Persons at work on full-time schedules in nonfarm jobs numbered 49.7 million in May--not significantly changed from a month earlier, but down 600,000 from May 1960. Almost all the over-the-year drop occurred among men and women in the 20- to 44-year-old age brackets.

The number usually working full time whose hours were cut below 35 because of slack work or other economic reasons dropped by 150,000 over the month to 1.3 million in May. Most of the drop occurred among adult men. The size of this group of part-time workers was only slightly larger than a year ago, whereas it had been running well above the levels of a year earlier for 13 months. As the chart (p. xiii) shows, this group is made up mostly of blue-collar workers (75 percent). In contrast, workers in blue-collar occupations represent 40 percent of all those at work in nonagricultural industries. Blue-collar workers, many of whom are hourly production workers in manufacturing and construction, are most subject to temporary cutbacks in the workweek, both in prosperity and in recession.

Workers usually on part time because of inability to find full-time jobs remained unchanged over the month at 1.5 million, 350,000 above May 1960 and higher than in any previous May on record. About 50 percent were in blue-collar occupations.

The largest group of part-time workers hold such jobs by their own choice. The number regularly employed part time rose by 350,000 to 6.8 million in May, about the same level as last year. These "voluntary" part-time workers usually show some increase at this time of year, as warmer weather brings teenagers more opportunities for work at odd jobs for private households and outdoor activities such as construction. Many of these young people will become full-time workers after school is out in June.

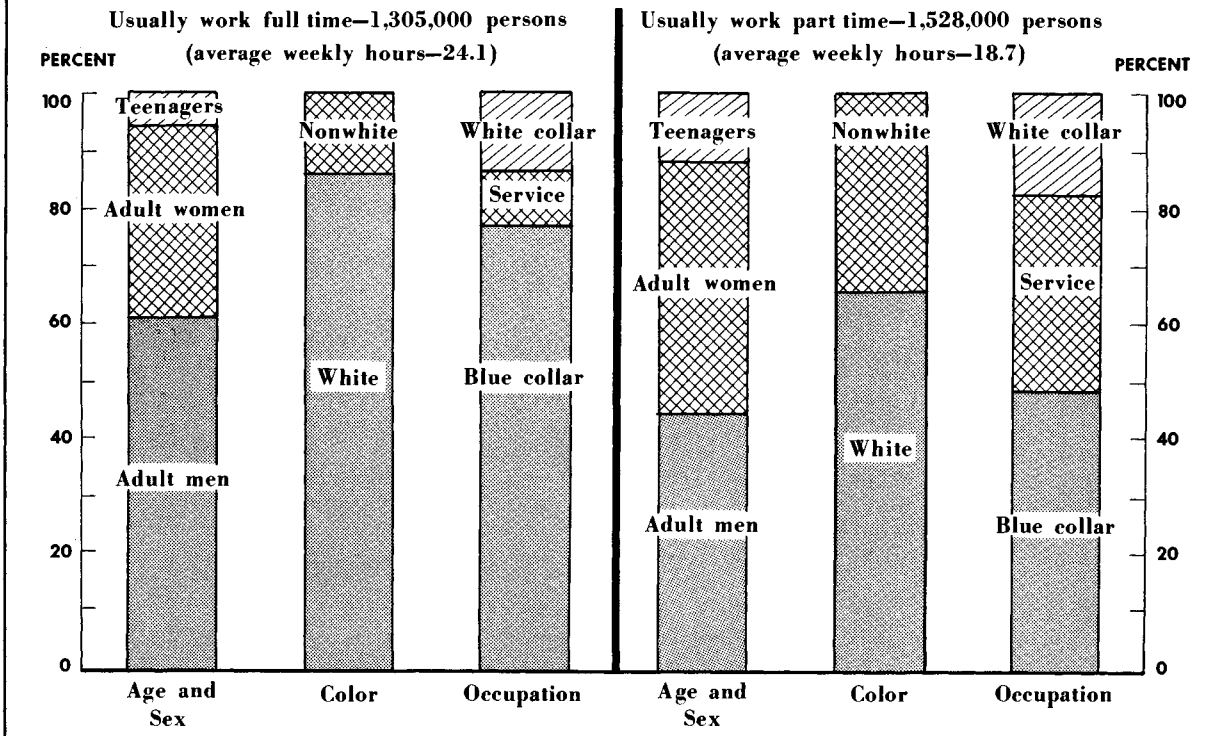

Labor Force

The April-May increase of 850,000 in the civilian labor force represented the usual gain for this time of year, bringing the total to 71.5 million, a record high for May. The rise over the month was accounted for by the addition of teenagers and adult women to the farm work force, as well as the entry of some youngsters into nonfarm activities.

After rather large increases during the first quarter of 1961, the over-the-year growth in the labor force amounted to 900,000 persons in both April and May. This is about the same as the yearly increase shown between 1959 and 1960, and still a little below long-term projections of annual labor force growth for the early 1960's.

NOTE: For data on insured unemployment, see Unemployment Insurance Claims published weekly by the Bureau of Employment Security.

¹Data for 1947-58 adjusted to reflect changes in the definition of employment and unemployment adopted in January 1957. Two groups averaging about one-quarter million workers which were formerly classified as employed (with a job but not at work)--those on temporary layoff and those waiting to start new wage and salary jobs within 30 days--were assigned to different classifications, mostly to the unemployed. Data by sex, shown in table A-2, were adjusted for the years 1948-58.

²Not available.

³Beginning 1953, labor force and employment figures are not strictly comparable with previous years as a result of the introduction of material from the 1950 Census into the estimating procedure. Population levels were raised by about 800,000; labor force, total employment, and agricultural employment by about 350,000, primarily affecting the figures for total and males. Other categories were relatively unaffected.

⁴Data include Alaska and Hawaii beginning 1960 and are therefore not strictly comparable with previous years. This inclusion has resulted in an increase of about half a million in the noninstitutional population 14 years of age and over, and about 300,000 in the labor force, four-fifths of this in nonagricultural employment. The levels of other labor force categories were not appreciably changed.

Table A-2: Employment status of the noninstitutional population, by sex

(Thousands of persons 14 years of age and over)

Sex, year, and month	Total noninstitutional population	Total labor force including Armed Forces		Civilian labor force				Unemployed ¹			Not in labor force
		Number	Percent of noninstitutional population	Total	Employed ¹		Number	Percent of labor force			
					Total	Agriculture		Nonagricultural industries	Not seasonally adjusted	Seasonally adjusted

Heating apparatus (except electric) and plumbers' supplies.....	-	106.6	105.3	116.0	116.1	-	79.5	78.6	88.1	88.5
Fabricated structural metal products....	-	274.7	270.6	287.7	282.0	-	193.6	189.5	204.4	199.7
Metal stamping, coating, and engraving..	-	214.4	207.2	236.5	237.2	-	172.2	165.1	192.9	193.7
Lighting fixtures.....	-	45.5	45.5	48.1	49.8	-	34.7	34.7	37.0	38.6
Fabricated wire products.....	-	51.0	49.8	57.4	58.1	-	40.1	39.0	45.9	46.6
Miscellaneous fabricated metal products.	-	129.5	129.2	139.9	143.1	-	99.8	99.5	109.5	112.6
MACHINERY (EXCEPT ELECTRICAL).....	1,576.8	1,577.6	1,573.9	1,660.9	1,677.8	1,080.9	1,081.1	1,076.3	1,159.3	1,176.4
Engines and turbines.....	-	97.4	96.3	103.2	104.3	-	59.6	58.0	64.5	65.8
Agricultural machinery and tractors....	-	156.1	153.9	149.3	153.4	-	110.4	108.6	101.7	105.5
Construction and mining machinery.....	-	113.3	112.3	130.3	132.5	-	76.3	75.5	89.9	91.4
Metalworking machinery.....	-	244.3	245.0	263.5	264.7	-	176.8	177.4	195.7	196.4
Special-industry machinery (except metalworking machinery).....	-	171.3	172.1	176.5	176.1	-	117.0	117.8	123.5	123.1
General industrial machinery.....	-	211.7	212.1	230.1	231.0	-	130.2	130.1	146.5	147.5
Office and store machines and devices...	-	143.1	142.2	138.9	139.0	-	91.7	90.6	92.3	92.9
Service-industry and household machines.	-	183.7	184.0	196.5	197.7	-	133.6	133.5	146.9	148.4
Miscellaneous machinery parts.....	-	256.7	256.0	272.6	279.1	-	185.5	184.8	198.3	205.4
ELECTRICAL MACHINERY.....	1,292.0	1,284.2	1,288.6	1,289.6	1,293.7	834.0	828.0	830.2	855.1	860.4
Electrical generating, transmission, distribution, and industrial apparatus.	-	404.9	404.6	414.8	417.9	-	266.9	266.0	279.3	283.1
Electrical appliances.....	-	37.4	37.3	38.9	39.3	-	27.3	27.2	29.1	29.5
Insulated wire and cable.....	-	27.8	28.4	28.6	28.3	-	21.2	21.5	22.0	21.8
Electrical equipment for vehicles.....	-	63.7	65.3	70.9	72.6	-	47.4	48.8	54.3	56.0
Electric lamps.....	-	26.0	26.2	29.5	29.8	-	22.3	22.6	25.8	25.9
Communication equipment.....	-	677.5	679.5	658.0	657.5	-	409.5	410.1	408.8	408.8
Miscellaneous electrical products.....	-	46.9	47.3	48.9	48.3	-	33.4	34.0	35.8	35.3
TRANSPORTATION EQUIPMENT.....	1,534.6	1,491.1	1,499.4	1,652.8	1,665.1	1,056.5	1,015.0	1,012.6	1,173.6	1,187.1
Motor vehicles and equipment.....	-	652.6	655.3	785.0	790.8	-	496.1	489.1	615.8	622.9
Aircraft and parts.....	-	643.3	647.5	658.3	668.7	-	363.7	367.1	388.0	398.1
Aircraft.....	-	363.9	367.4	381.4	387.0	-	202.7	205.0	223.5	229.1
Aircraft engines and parts.....	-	141.4	141.3	138.7	139.8	-	83.4	83.3	82.4	83.3
Aircraft propellers and parts.....	-	12.7	12.7	14.1	13.9	-	7.3	7.3	8.5	8.5
Other aircraft parts and equipment.....	-	125.3	126.1	124.1	128.0	-	70.3	71.5	73.6	77.2
Ship and boat building and repairing....	-	141.5	142.4	137.4	135.6	-	117.1	118.2	114.7	113.1
Ship building and repairing.....	-	120.5	122.0	112.3	110.1	-	99.3	100.9	93.0	90.9
Boat building and repairing.....	-	21.0	20.4	25.1	25.5	-	17.8	17.3	21.7	22.2
Railroad equipment.....	-	44.4	45.2	61.6	59.6	-	30.9	31.3	46.7	44.7
Other transportation equipment.....	-	9.3	9.0	10.5	10.4	-	7.2	6.9	8.4	8.3
INSTRUMENTS AND RELATED PRODUCTS.....	337.4	334.8	335.9	351.3	353.1	212.0	210.6	210.7	227.7	229.8
Laboratory, scientific, and engineering instruments.....	-	64.3	65.1	66.0	66.3	-	34.7	35.0	35.8	36.0
Mechanical measuring and controlling instruments.....	-	97.4	96.7	100.2	100.3	-	62.3	61.6	66.4	66.8
Optical instruments and lenses.....	-	17.6	17.9	18.4	18.4	-	11.6	11.9	12.7	12.7
Surgical, medical, and dental instruments.....	-	44.5	44.6	45.1	45.3	-	29.7	29.7	30.2	30.4
Ophthalmic goods.....	-	24.4	24.3	27.6	27.6	-	18.7	18.5	21.5	21.7
Photographic apparatus.....	-	62.9	63.3	65.5	65.6	-	35.6	35.7	38.7	38.7
Watches and clocks.....	-	23.7	24.0	28.5	29.6	-	18.0	18.3	22.4	23.5

¹Derived by assuming that overtime hours are paid at the rate of time and one-half.

²Not available as average overtime rates are significantly above time and one-half. Inclusion of data for the group in the nondurable-goods total has little effect.

NOTE: Data for the 2 most recent months are preliminary.

Table C-4: Indexes of aggregate weekly man-hours and payrolls
in industrial and construction activities¹

¹For mining and manufacturing, laundries, and cleaning and dyeing plants, data refer to production and related workers; for contract construction, to construction workers; and for all other industries, to nonsupervisory workers.

²South: Includes the following 17 States—Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

³West: Includes California, Oregon, and Washington.

⁴North: Includes all States except the 17 listed as South in footnote 2.

⁵Not available.

⁶Data relate to employees in such occupations in the telephone industry as switchboard operators; service assistants; operating room instructors; and pay-station attendants. In 1960, such employees made up 35 percent of the total number of nonsupervisory employees in establishments reporting hours and earnings data.

⁷Data relate to employees in such occupations in the telephone industry as central office craftsmen; installation and exchange repair craftsmen; line, cable, and conduit craftsmen; and laborers. In 1960, such employees made up 30 percent of the total number of nonsupervisory employees in establishments reporting hours and earnings data.

⁸Data relate to domestic employees except messengers.

*Class I railroads - February 1961 data are: \$115.02, 42.6, and \$2.70.

NOTE: Data for the current month are preliminary.

Table C-7: Gross and spendable average weekly earnings in industrial and construction activities, in current and 1947-49 dollars¹

Type of earnings	Mining			Contract construction			Manufacturing		
	Apr. 1961	Mar. 1961	Apr. 1960	Apr. 1961	Mar. 1961	Apr. 1960	Apr. 1961	Mar. 1961	Apr. 1960
Gross average weekly earnings:									
Current dollars.....	\$107.17	\$104.10	\$111.38	\$119.97	\$119.64	\$119.19	\$91.57	\$90.71	\$89.60
1947-49 dollars.....	84.05	81.65	88.26	94.09	93.84	94.45	71.82	71.15	71.00
Spendable average weekly earnings:									
Worker with no dependents:									
Current dollars.....	86.17	83.82	89.40	95.98	95.72	95.38	74.00	73.34	72.48
1947-49 dollars.....	67.58	65.74	70.84	75.28	75.07	75.58	58.04	57.52	57.43
Worker with 3 dependents:									
Current dollars.....	94.34	91.82	97.79	104.84	104.56	104.20	81.57	80.89	80.01

¹ Beginning with January 1959, transfers between establishments of the same firm are included in total accessions and total separations, therefore rates for these items are not strictly comparable with prior data. Transfers comprise part of other accessions and other separations, the rates for which are not shown separately.

NOTE: Data for the current month are preliminary.

Data in all tables in Section D relate to the United States without Alaska and Hawaii.

Explanatory Notes

Additional information concerning the preparation of the labor force, employment, hours and earnings, and labor turnover series—concepts and scope, survey methods, and limitations—is contained in technical notes for each of these series, available from the Bureau of Labor Statistics free of charge. Use order blank on page 9-E.

INTRODUCTION

The statistics in this periodical are compiled from two major sources: (1) household interviews and (2) payroll reports from employers.

Data based on household interviews are obtained from a sample survey of the population. The survey is conducted each month by the Bureau of the Census for the Bureau of Labor Statistics and provides a comprehensive measure of the labor force, i.e., the total number of persons 14 years of age and over who are employed or unemployed. It also provides data on their personal and economic characteristics such as age, sex, color, marital status, occupations, hours of work, and duration of unemployment. The information is collected by trained interviewers from a sample of about 35,000 households in 333 areas throughout the country and is based on the activity or status reported for the calendar week ending nearest the 15th of the month.

Data based on establishment payroll records are compiled each month from mail questionnaires by the Bureau of Labor Statistics, in cooperation with State agencies. The payroll survey provides detailed industry information on nonagricultural wage and salary employment, average weekly hours, average hourly and weekly earnings, and labor turnover for the Nation, States, and metropolitan areas.

The figures are based on payroll reports from a sample of 180,000 establishments employing about 25 million nonfarm wage and salary workers. The data relate to all workers, full- or part-time, who received pay during the payroll period ending nearest the 15th of the month.

Relation between the household and payroll series

The household and payroll data supplement one another, each providing significant types of information that the other cannot suitably supply. Population characteristics, for example, are readily obtained only from the household survey whereas detailed industrial classifications can be reliably derived only from establishment reports.

Data from these two sources differ from each other because of differences in definition and coverage, sources of information, methods of collection, and estimating procedures. Sampling variability and response errors are additional reasons for discrepancies. The factors which have a differential effect on levels and trends of the two series are described below:

Employment

Coverage. The household survey definition of employment comprises wage and salary workers (including domestics and other private household workers), self-employed persons, and unpaid workers who worked 15 hours or more during the survey week in family-operated enterprises. Employment in both farm and nonfarm industries is included. The payroll survey covers only wage and salary employees on the payrolls of nonfarm establishments.

Multiple jobholding. The household approach provides information on the work status of the population without duplication since each person is classified as employed, unemployed, or not in the labor force. Employed persons holding more than one job are counted only once, and are classified according to the job at which they worked the greatest number of

hours during the survey week. In the figures based on establishment records, persons who worked in more than one establishment during the reporting period are counted each time their names appear on payrolls.

Unpaid absences from jobs. The household survey includes among the employed all persons who had jobs but were not at work during the survey week—that is, were not working or looking for work but had jobs from which they were temporarily absent because of illness, bad weather, vacation, labor-management dispute, or because they were taking time off for various other reasons, whether or not they were paid by their employers for the time off. In the figures based on payroll reports, persons on paid sick leave, paid vacation, or paid holiday are included, but not those on leave without pay for the entire payroll period.

Hours of Work

The household survey measures hours actually worked whereas the payroll survey measures hours paid for by employers. In the household survey data, all persons with a job but not at work are excluded from the hours distributions and the computations of average hours. In the payroll survey, employees on paid vacation, paid holiday, or paid sick leave are included and assigned the number of hours for which they were paid during the reporting period.

Comparability of the household interview data with other series

Unemployment insurance data. The unemployed total from the household survey includes all persons who did not work at all during the survey week and were looking for work or were laid off, regardless of whether or not they were eligible for unemployment insurance. Figures on unemployment insurance claims, prepared by the Bureau of Employment Security of the Department of Labor, exclude persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (agriculture, State and local government, domestic service, self-employed, unpaid family work, nonprofit organizations, and firms below a minimum size).

In addition, the qualifications for drawing unemployment compensation differ from the definition of unemployment used in the household survey. For example, persons with a job but not at work and persons working only a few hours during the week are sometimes eligible for unemployment compensation, but are classified as employed rather than unemployed in the household survey.

Agricultural employment estimates of the Department of Agriculture. The principal differences in coverage are the inclusion of persons under 14 in the Agricultural Marketing Service (AMS) series and the treatment of dual jobholders who are counted more than once if they worked on more than one farm during the reporting period. There are also wide differences in sampling techniques and collecting and estimating methods, which cannot be readily measured in terms of impact on differences in level and trend of the two series.

Comparability of the payroll employment data with other series

Statistics on manufactures and business, Bureau of the Census. BLS establishment statistics on employment differ from employment counts derived by the Bureau of the Census from

its censuses or annual sample surveys of manufacturing establishments and the censuses of business establishments. The major reason for lack of comparability is different treatment of business units considered parts of an establishment, such as central administrative offices and auxiliary units, and in the industrial classification of establishments due to different reporting patterns by multi-unit companies. There are also differences in the scope of the industries covered, e.g., the Census of Business excludes professional services, transportation companies, and financial establishments, while these are included in BLS statistics.

County Business Patterns. Data in County Business Patterns, published jointly by the U.S. Departments of Commerce and Health, Education, and Welfare, differ from BLS establishment statistics in the units considered integral parts of an establishment and in industrial classification. In addition, CBP data exclude employment in nonprofit institutions, interstate railroads, and government.

Employment covered by Unemployment Insurance programs. Not all nonfarm wage and salary workers are covered by the Unemployment Insurance programs. All workers in certain activities, such as nonprofit organizations and interstate railroads, are excluded. In addition, small firms in covered industries are also excluded in 32 States. In general, these are establishments with less than four employees.

LABOR FORCE DATA

COLLECTION AND COVERAGE

Statistics on the employment status of the population, the personal, occupational, and other economic characteristics of employed and unemployed persons, and related labor force data are compiled for the BLS by the Bureau of the Census in its Current Population Survey (CPS). (A detailed description of this survey appears in Concepts and Methods Used in the Current Employment and Unemployment Statistics Prepared by the Bureau of the Census, U. S. Bureau of the Census, Current Population Reports, Series P-23, No. 5. This report is available from BLS on request.)

These monthly surveys of the population are conducted with a scientifically selected sample designed to represent the civilian noninstitutional population 14 years and over. Respondents are interviewed to obtain information about the employment status of each member of the household 14 years of age and over. The inquiry relates to activity or status during the calendar week, Sunday through Saturday, ending nearest the 15th of the month. This is known as the survey week. Actual field interviewing is conducted in the following week.

Inmates of institutions and persons under 14 years of age are not covered in the regular monthly enumerations and are excluded from the population and labor force statistics shown in this report. Data on members of the Armed Forces, who are included as part of the categories "total noninstitutional population" and "total labor force," are obtained from the Department of Defense.

The sample for CPS is spread over 333 areas comprising 641 counties and independent cities, with coverage in 50 States and the District of Columbia. At present, completed interviews are obtained each month from about 35,000 households. There are about 1,500 additional sample households from which information should be collected but is not because the occupants are not found at home after repeated calls, are temporarily absent, or are unavailable for other reasons. This represents a noninterview rate for the survey of about 4 percent. Part of the sample is changed each month. The rotation plan provides for approximately three-fourths of the sample to be common from one month to the next, and one-half to be common with the same month a year ago.

CONCEPTS

Employed Persons comprise (a) all those who during the survey week did any work at all either as paid employees, or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (b) all those who were not working or looking for work but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for various other reasons, whether or not they were paid by their employers for the time off.

Each employed person is counted only once. Those who held more than one job are counted in the job at which they worked the greatest number of hours during the survey week.

Included in the total are employed citizens of foreign countries, temporarily in the United States, who are not living on the premises of an Embassy (e.g., Mexican migratory farm workers).

Excluded are persons whose only activity consisted of work around the house (such as own home housework, and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations.

Unemployed Persons comprise all persons who did not work at all during the survey week and were looking for work, regardless of whether or not they were eligible for unemployment insurance. Also included as unemployed are those who did not work at all and (a) were waiting to be called back to a job from which they had been laid off; or (b) were waiting to report to a new wage or salary job within 30 days (and were not in school during the survey week); or (c) would have been looking for work except that they were temporarily ill or believed no work was available in their line of work or in the community. Persons in this latter category will usually be residents of a community in which there are only a few dominant industries which were shut down during the survey week. Not included in this category are persons who say they were not looking for work because they were too old, too young, or handicapped in any way.

The Unemployment Rate represents the number unemployed as a percent of the civilian labor force, i.e., the sum of the employed and unemployed. This measure can also be computed for groups within the labor force classified by sex, age, marital status, color, etc. When applied to industry and occupation groups, the labor-force base for the unemployment rate also represents the sum of the employed and the unemployed, the latter classified according to industry and occupation of their latest full-time civilian job.

Duration of Unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work or would have been looking for work except for temporary illness, or belief that no work was available in their line of work or in the community. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. Average duration is an arithmetic mean computed from a distribution by single weeks of unemployment.

The Civilian Labor Force comprises the total of all civilians classified as employed or unemployed in accordance with the criteria described above. The "total labor force" also includes members of the Armed Forces stationed either in the United States or abroad.

Not in Labor Force includes all civilians 14 years and over who are not classified as employed or unemployed. These persons are further classified as "engaged in own home housework," "in school," "unable to work" because of long-term physical or mental illness, and "other." The "other" group includes for the most part retired persons, those reported as too old to work, the voluntarily idle, and seasonal workers for whom the survey week fell in an "off" season and who were not reported as unemployed. Persons doing only incidental unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation, Industry, and Class of Worker apply to the job held in the survey week. Persons with two or more jobs are classified in the job at which they worked the greatest number of hours during the survey week. The occupation and industry groups used in data derived from the CPS household interviews are defined as in the 1960 Census of Population. Information on the detailed categories included in these groups is available upon request.

The industrial classification system used in the Census of Population and the Current Population Survey differs somewhat from that used by the BLS in its reports on employment, by industry. Employment levels by industry from the household survey, although useful for many analytical purposes, are not published in order to avoid public misunderstanding since they differ from the payroll series because of differences in classification, sampling variability, and other reasons. The industry figures from the household survey are used as a base for published distributions on hours of work, unemployment rates, and other

characteristics of industry groups such as age, sex, and occupation.

The class-of-worker breakdown specifies "wage and salary workers," subdivided into private and government workers, "self-employed workers," and "unpaid family workers." Wage and salary workers receive wages, salary, commission, tips, or pay in kind from a private employer or from a governmental unit. Self-employed persons are those who work for profit or fees in their own business, profession, or trade, or operate a farm. Unpaid family workers are persons working without pay for 15 hours a week or more on a farm or in a business operated by a member of the household to whom they are related by blood or marriage.

Hours of Work statistics relate to the actual number of hours worked during the survey week. For example, a person who normally works 40 hours a week but who was off on the Veterans Day holiday would be reported as working 32 hours even though he was paid for the holiday.

For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the week. However, all the hours are credited to the major job.

Persons who worked 35 hours or more in the survey week are designated as working "full time"; persons who worked between 1 and 34 hours are designated as working "part time." Part-time workers are classified by their usual status at their present job (either full time or part time) and by their reason for working part time during the survey week (economic or other reasons). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. "Other reasons" include: Labor dispute, bad weather, own illness, vacation, demands of home housework, school, no desire for full-time work and full-time worker only during peak season.

ESTIMATING METHODS

The estimating procedure is essentially one of using sample results to obtain percentages of the population in a given category. The published estimates are then obtained by multiplying these percentage distributions by independent estimates of the population. The principal steps involved are shown below. Under the estimation methods used in the CPS, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. There are no subsequent adjustments to independent benchmark data on labor force, employment, or unemployment. Therefore, revisions of the historical data are not an inherent feature of this statistical program.

1. Noninterview adjustment. The weights for all interviewed households are adjusted to the extent needed to account for occupied sample households for which no information was obtained because of absence, impassable roads, refusals, or unavailability for other reasons. This adjustment is made separately by groups of sample areas and, within these, for six groups--color (white and nonwhite) within the three residence categories (urban, rural nonfarm, and rural farm). The proportion of sample households not interviewed varies from 3 to 5 percent depending on weather, vacations, etc.

2. Ratio estimates. The distribution of the population selected for the sample may differ somewhat, by chance, from that of the Nation as a whole, in such characteristics as age, color, sex, and residence. Since these population characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio estimates as follows:

a. First-stage ratio estimate. This is the procedure in which the sample proportions are weighted by the known 1950 Census data on the color-residence distribution of the population. This step takes into account the differences existing at the time of the 1950 Census between the color-residence distribution for the Nation and for the sample areas.

b. Second-stage ratio estimate. In this step, the sample proportions are weighted by independent current estimates of the population by age, sex, and color. These estimates are prepared by carrying forward the most recent census data (1950) to take account of subsequent aging of the population,

mortality, and migration between the United States and other countries.

3. Composite estimate procedure. In deriving statistics for a given month, a composite estimating procedure is used which takes account of net changes from the previous month for continuing parts of the sample (75 percent) as well as the sample results for the current month. This procedure reduces the sampling variability especially of month-to-month changes but also of the levels for most items.

Seasonal Adjustment

The seasonal adjustment method used for the labor force series is an adaptation of the standard ratio-to-moving average method, with a provision for "moving" adjustment factors to take account of changing seasonal patterns. In the case of unemployment, four age-sex groups (male and female unemployed workers under age 20 and aged 20 and over) are separately adjusted for seasonal variation and are then added to give a seasonally adjusted total unemployment figure. The seasonally adjusted rate of unemployment is derived by dividing the seasonally adjusted figure for total unemployment (the sum of the four seasonally adjusted age-sex components) by the figure for the seasonally adjusted civilian labor force. A description of the basic method was published in the August 1960 Monthly Labor Review; the method for unemployment is discussed on page xii of the February 1961 issue of Employment and Earnings.

Seasonal adjustment factors for major components of the labor force to be applied to data for 1959 and later are shown in table A. Seasonally adjusted aggregates for these and other major series for the period July 1948 through December 1960 are shown on pages xiii through xxiii of the February 1961 issue. These factors and seasonally adjusted data replace those published in BLS Special Labor Force Report No. 8, New Seasonal Adjustment Factors for Labor Force Components.

Table A. Seasonal adjustment factors for the labor force and major components, to be used for the period 1959-61

Month	Civilian labor force	Employment			Unemployment			
		Total	Agriculture	Nonagricultural industries	Males		Females	
					Aged 14 to 19	Aged 20 and over	Aged 14 to 19	Aged 20 and over

Dec...	99.2	99.4	85.6	101.0	89.8	101.1	72.7	88.5

Reliability of the Estimates

Since the estimates are based on a sample, they may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures.

The standard error is a measure of sampling variability, that is, the variations that might occur by chance because only a sample of the population is surveyed. The chances are about two out of three that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 19 out of 20 that the difference would be less than twice the standard error.

Table B shows the average standard error for the major employment status categories, by sex, computed from data for 12 recent months. Estimates of change derived from the survey are also subject to sampling variability. The standard error of change for consecutive months is also shown in table B. The standard errors of level shown in table B are acceptable approximations of the standard errors of year-to-year change.

Table B. Average standard error of major employment status categories

(In thousands)		
Employment status and sex	Average standard error of--	
	Monthly level	Month-to-month change (consecutive months only)
BOTH SEXES		
Labor force and total employment.	250	180
Agriculture.....	200	120
Nonagricultural employment.....	300	180
Unemployment.....	100	100
MALE		
Labor force and total employment.	120	90
Agriculture.....	180	90
Nonagricultural employment.....	200	120
Unemployment.....	75	90
FEMALE		
Labor force and total employment.	180	150
Agriculture.....	75	55
Nonagricultural employment.....	180	120
Unemployment.....	65	65

The figures presented in table C are to be used for other characteristics and are approximations of the standard errors of all such characteristics. They should be interpreted as providing an indication of the order of magnitude of the standard errors rather than as the precise standard error for any specific item.

Table C. Standard error of level of monthly estimates

(In thousands)						
Size of estimate	Both sexes		Male		Female	
	Total or white	Non-white	Total or white	Non-white	Total or white	Non-white
10.....	5	5	7	5	5	5
50.....	11	10	14	10	10	10
100.....	15	14	20	14	14	14
250.....	24	21	31	21	22	21
500.....	34	30	43	30	31	30
1,000.....	48	40	60	40	45	40
2,500.....	75	50	90	50	70	50
5,000.....	100	50	110	100
10,000.....	140	140	130
20,000.....	180	150	170
30,000.....	210
40,000.....	220

The standard error of the change in an item from one month to the next month is more closely related to the standard error of the monthly level for that item than to the size of the specific month-to-month change itself. Thus, in order to use the approximations to the standard errors of month-to-month changes as presented in table D, it is first necessary to obtain the standard error of the monthly level of the item in table C, and then find the standard error of the month-to-month change in table D corresponding to this standard error of level. It should be noted that table D applies to estimates of change between 2 consecutive months. For changes between the current month and the same month last year, the standard errors of level shown in table C are acceptable approximations.

Illustration: Assume that the tables showed the total number of persons working a specific number of hours, as 15,000,000, an increase of 500,000 over the previous month. Linear interpolation in the first column of table C shows that the standard error of 15,000,000 is about 160,000. Consequently, the chances are about 68 out of 100 that the figure which would have been obtained from a complete count of the number of persons working the given number of hours would have differed by less than 160,000 from the sample estimate. Using the 160,000

as the standard error of the monthly level in table D, it may be seen that the standard error of the 500,000 increase is about 135,000.

Table D. Standard error of estimates of month-to-month change

(In thousands)		
Standard error of monthly level	Standard error of month-to-month change	
	Estimates relating to agricultural employment	All estimates except those relating to agricultural employment
10.....	14	12
25.....	35	26
50.....	70	48
100.....	100	90
150.....	110	130
200.....	160
250.....	190
300.....	220

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator depends upon both the size of the percentage and the size of the total upon which the percentage is based. Where the numerator is a subclass of the denominator, estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerator of the percentage, particularly if the percentage is large (50 percent or greater). Table E shows the standard errors for percentages derived from the survey. Linear interpolation may be used for percentages and base figures not shown in table E.

Table E. Standard error of percentages

Estimated percentage	Base of percentage (thousands)					
	150	250	500	1,000	2,000	3,000

ESTABLISHMENT DATA

COLLECTION

Payroll reports provide current information on wage and salary employment, hours, earnings, and labor turnover in nonfarm establishments, by geographic location.

Federal-State Cooperation

Under cooperative arrangements with State agencies, the respondent fills out only 1 employment or labor turnover schedule, which is then used for national, State, and area estimates. This eliminates duplicate reporting on the part of respondents and, together with the use of identical techniques at the national and State levels, ensures maximum geographic comparability of estimates.

State agencies mail the forms to the establishments and examine the returns for consistency, accuracy, and completeness. The States use the information to prepare State and area series and then send the data to the BLS for use in preparing the national series. The BLS and the Bureau of Employment Security jointly finance the current employment statistics program in 43 States, the turnover program in 41 States.

Shuttle Schedules

The Form BLS 790 is used to collect employment, payroll, and man-hours data, Form 1219 labor turnover data. Both schedules are of the "shuttle" type, with space for each month of the calendar year.

The BLS 790 provides for entry of data on the number of full- and part-time workers on the payrolls of nonagricultural establishments for the pay period ending nearest the 15th of each month. The labor turnover schedule provides for the collection of information on the total number of accessions and separations, by type, during the calendar month.

INDUSTRIAL CLASSIFICATION

Establishments are classified into industries on the basis of their principal product or activity determined from information on annual sales volume. This information is collected each year on a product supplement to the monthly 790 or 1219 report. In the case of an establishment making more than one product or engaging in more than one activity, the entire employment of the establishment is included under the industry indicated by the most important product or activity.

Prior to publication of State and area data for January 1959, all national, State, and area employment, hours, earnings, and labor turnover series were classified in accordance with the following documents: (1) For manufacturing, Standard Industrial Classification Manual, Volume I, Bureau of the Budget, 1945, and (2) for nonmanufacturing, Industrial Classification Code, Social Security Board, 1942. Beginning with January 1959 (with an overlap for 1958), State and area series are classified under the revised Standard Industrial Classification Manual published in 1957. The national industry statistics will be converted to the '57 SIC in 1961.

COVERAGE

Employment, Hours, and Earnings

Monthly reports on employment and, for most industries, payroll and man-hours are obtained from approximately 180,000 establishments. The table below shows the approximate proportion of total employment in each industry division covered by the group of establishments furnishing monthly employment data. The coverage for individual industries within the division may vary from the proportions shown.

Approximate size and coverage of BLS employment and payrolls sample 1/

Industry division	Number of establishments in sample	Employees	
		Number in sample	Percent of total
Mining.....	3,500	393,000	47
Contract construction.....	22,000	860,000	26
Manufacturing.....	43,900	11,779,000	69
Transportation and public utilities: Interstate railroads (ICC).....	---	1,152,000	97
Other transportation and public utilities.....	15,700	1,693,000	57
Wholesale and retail trade..	65,100	2,244,000	20
Finance, insurance, and real estate.....	12,900	757,000	33
Service and miscellaneous...	11,400	848,000	13
Government:			
Federal (Civil Service Commission) 2/.....	---	2,196,000	100
State and local.....	5,800	3,148,000	63

1/ Since some firms do not report payroll and man-hour information, hours and earnings estimates may be based on a slightly smaller sample than employment estimates.

2/ State and area estimates of Federal employment are based on 2,300 reports covering 1,430,000 employees, collected through the BLS-State cooperative program.

Labor Turnover

Labor turnover reports are received from approximately 10,500 establishments in the manufacturing, mining, and communication industries (see table below). The following manufacturing industries are excluded from the labor turnover sample: Printing, publishing, and allied industries (since April 1943); canning and preserving fruits, vegetables, and sea foods; women's and misses' outerwear; and fertilizer.

Approximate size and coverage of BLS labor turnover sample used in computing national rates

Industry	Number of establishments in sample	Employees	
		Number in sample	Percent of total
Manufacturing.....	10,200	5,994,000	39
Durable goods.....	6,400	4,199,000	43
Nondurable goods.....	3,800	1,795,000	32
Metal mining.....	120	57,000	53
Coal mining:			
Anthracite.....	20	6,000	19
Bituminous.....	200	71,000	32
Communication:			
Telephone.....	(1/)	661,000	88
Telegraph.....	(1/)	28,000	65

1/ Does not apply.

CONCEPTS

Industry Employment

Employment data for all except Federal Government refer to persons on establishment payrolls who received pay for any part of the pay period ending nearest the 15th of the month. For Federal Government establishments, current data generally refer to persons who received pay for the last day of the month.

The data exclude proprietors, the self-employed, unpaid family workers, farm workers, and domestic workers in households. Salaried officers of corporations are included. Government employment covers only civilian employees; Federal military personnel are shown separately, but their number is excluded from total nonagricultural employment.

Persons on an establishment payroll who are on paid sick leave (when pay is received directly from the firm), paid holiday, or paid vacation, or who work during a part of the pay period and are unemployed or on strike during the rest of the period, are counted as employed. Persons are not counted as employed who are laid off, on leave without pay, or on strike for the entire period, or who are hired but do not report to work during the period.

Benchmark Adjustments

Employment estimates are periodically compared with complete counts of employment in the various industries defined as nonagricultural, and appropriate adjustments made as indicated by the total counts or benchmarks. The comparison made for the first 3 months of 1957, the last benchmark adjustment, resulted in changes amounting to 0.5 percent of all nonagricultural employment, identical with the extent of the adjustment to the first quarter 1956 benchmark. The changes were less than 0.5 percent for three of the eight major industry divisions; under 2 percent for two other divisions; and 3.2, 3.3, and 6.4 percent for the remaining three divisions. The manufacturing total was changed by only 0.1 percent for the second successive year. Within manufacturing, the benchmark and estimate differed by 1.0 percent or less in 39 of the 132 individual industries, 41 industries were adjusted by 1.1 to 2.5 percent, and an additional 27 industries differed by 2.6-5.0 percent. One significant cause of differences between the benchmark and estimate is the change in industrial classification of individual firms, which is usually not reflected in BLS estimates until they are adjusted to new benchmarks. Other causes are sampling and response errors.

The basic sources of benchmark information are the quarterly tabulations of employment data, by industry, compiled by State agencies from reports of establishments covered under State unemployment insurance laws. These tabulations are prepared under Bureau of Employment Security direction. Supplementary tabulations prepared by the U.S. Bureau of Old-Age and Survivors Insurance are used for the group of establishments exempt from State unemployment insurance laws because of their

small size. Benchmarks for industries wholly or partly excluded from the unemployment insurance laws are derived from a variety of other sources.

The BLS estimates relating to the benchmark quarter (the first quarter of the year) are compared with the new benchmark levels, industry by industry. Where revisions are necessary, the monthly estimates are adjusted between the new benchmark and the preceding one. The new benchmark for each industry is then projected to the current month by use of the sample trends. Under this procedure, the benchmark is used to establish the level of employment while the sample is used to measure the month-to-month changes in the level.

Seasonal Adjustment

Employment series for many industries reflect a regularly recurring seasonal movement which can be measured on the basis of past experience. By eliminating that part of the change in employment which can be ascribed to usual seasonal variation, it is possible to clarify the cyclical and other non-seasonal movements in the series. Seasonally adjusted employment aggregates are published. These estimates are derived by the use of factors based on free-hand adjustments of 12-month moving averages. Seasonal factors are available on request.

The new adaptation of the standard ratio-to-moving average method presently used for the labor force and weekly hours series (see pages 3-E and 7-E) will eventually be applied to the industry employment series. In order to avoid an interim revision, the shift to the new seasonal adjustment method for the latter series will be made at the time the series are converted to the 1957 Standard Industrial Classification in 1961.

Industry Hours and Earnings

Hours and earnings data are derived from reports of payrolls and man-hours for production and related workers or nonsupervisory employees. These terms are defined below. When the pay period reported is longer than 1 week, the figures are reduced to a weekly basis.

Production and Related Workers include working foremen and all nonsupervisory workers (including leadmen and trainees) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping, maintenance, repair, janitorial and watchman services, product development, auxiliary production for plant's own use (e.g., power plant), and recordkeeping and other services closely associated with the above production operations.

Nonsupervisory Employees include employees (not above the working supervisory level) such as office and clerical workers, repairmen, salespersons, operators, drivers, attendants, service employees, linemen, laborers, janitors, watchmen, and similar occupational levels, and other employees whose services are closely associated with those of the employees listed.

Payroll covers the payroll for full- and part-time production, construction, or nonsupervisory workers who received pay for any part of the pay period ending nearest the 15th of the month. The payroll is reported before deductions of any kind, e.g., old-age and unemployment insurance, group insurance, withholding tax, bonds, and union dues; also included is pay for overtime, holidays, vacations, and sick leave paid directly by the firm. Bonuses (unless earned and paid regularly each pay period), other pay not earned in pay period reported (e.g., retroactive pay), and the value of free rent, fuel, meals, or other payment in kind are excluded.

Man-Hours cover man-hours worked or paid for, during the pay period ending nearest the 15th of the month, for production, construction, and nonsupervisory workers. The man-hours include hours paid for holidays and vacations, and for sick leave when pay is received directly from the firm.

Overtime Hours cover premium overtime hours of production and related workers during the pay period ending nearest the 15th of the month. Overtime hours are those for which premiums were paid because the hours were in excess of the number of hours of either the straight-time workday or workweek. Weekend and holiday hours are included only if premium wage rates were paid. Hours for which only shift differential, hazard, incentive, or other similar types of premiums were paid are excluded.

Gross Average Hourly and Weekly Earnings

Average hourly earnings for manufacturing and non-manufacturing industries are on a "gross" basis, reflecting not only changes in basic hourly and incentive wage rates, but also such variable factors as premium pay for overtime and late-shift work, and changes in output of workers paid on an incentive plan. Employment shifts between relatively high-paid and low-paid work and changes in workers' earnings in individual establishments also affect the general earnings averages. Averages for groups and divisions further reflect changes in average hourly earnings for individual industries.

Averages of hourly earnings differ from wage rates. Earnings are the actual return to the worker for a stated period of time, while rates are the amounts stipulated for a given unit of work or time. The earnings series, however, does not measure the level of total labor costs on the part of the employer since the following are excluded: Irregular bonuses, retroactive items, payments of various welfare benefits, payroll taxes paid by employers, and earnings for those employees not covered under the production-worker or nonsupervisory-employee definitions.

Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings. Therefore, weekly earnings are affected not only by changes in gross average hourly earnings, but also by changes in the length of the workweek, part-time work, stoppages for varying causes, labor turnover, and absenteeism.

Average Weekly Hours

The workweek information relates to the average hours for which pay was received, and is different from standard or scheduled hours. Such factors as absenteeism, labor turnover, part-time work, and stoppages cause average weekly hours to be lower than scheduled hours of work for an establishment. Group averages further reflect changes in the workweek of component industries.

Average Overtime Hours

The overtime hours represent that portion of the gross average weekly hours which were in excess of regular hours and for which premium payments were made. If an employee works on a paid holiday at regular rates, receiving as total compensation his holiday pay plus straight-time pay for hours worked that day, no overtime hours would be reported.

Since overtime hours are premium hours by definition, the gross weekly hours and overtime hours do not necessarily move in the same direction from month to month; for example, premiums may be paid for hours in excess of the straight-time workday although less than a full week is worked. Diverse trends on the industry-group level may also be caused by a marked change in gross hours for a component industry where little or no overtime was worked in both the previous and current months. In addition, such factors as stoppages, absenteeism, and labor turnover may not have the same influence on overtime hours as on gross hours.

Spendable Average Weekly Earnings

Spendable average weekly earnings in current dollars are obtained by deducting estimated Federal social security and income taxes from gross weekly earnings. The amount of income tax liability depends on the number of dependents supported by the worker, as well as on the level of his gross income. To reflect these variables, spendable earnings are computed for two types of income receivers--a worker with no dependents, and a worker with three dependents. The computations are based on the gross average weekly earnings for all production and related workers in manufacturing, mining, or contract construction without regard to marital status, family composition, or total family income.

"Real" earnings are computed by dividing the current Consumer Price Index into the earnings average for the current month. The resulting level of earnings expressed in 1947-49 dollars is thus adjusted for changes in purchasing power since the base period.

Average Hourly Earnings Excluding Overtime

Average hourly earnings excluding premium overtime

pay are computed by dividing the total production-worker payroll for the industry group by the sum of total production-worker man-hours and one-half of total overtime man-hours. Prior to January 1956, data were based on the application of adjustment factors to gross average hourly earnings (as described in the Monthly Labor Review, May 1950, pp. 537-540). Both methods eliminate only the earnings due to overtime paid for at one and one-half times the straight-time rates. No adjustment is made for other premium payment provisions, such as holiday work, late-shift work, and overtime rates other than time and one-half.

Indexes of Aggregate Weekly Payrolls and Man-Hours

The indexes of aggregate weekly payrolls and man-hours are prepared by dividing the current month's aggregate by the monthly average for the 1947-49 period. The man-hour aggregates are the product of average weekly hours and production-worker employment, and the payroll aggregates are the product of gross average weekly earnings and production-worker employment.

Railroad Hours and Earnings

The figures for Class I railroads (excluding switching and terminal companies) are based on monthly data summarized in the M-300 report of the Interstate Commerce Commission and relate to all employees who received pay during the month except executives, officials, and staff assistants (ICC Group I). Gross average hourly earnings are computed by dividing total compensation by total hours paid for. Average weekly hours are obtained by dividing the total number of hours paid for, reduced to a weekly basis, by the number of employees, as defined above. Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings.

Seasonal adjustment

Seasonally adjusted average weekly hours for selected industries were introduced in the July 1960 issue of Employment and Earnings. The new adaptation of the standard ratio-to-moving average method used for the labor force series (see page 3-E) was also used to adjust the weekly hours data for seasonality.

Labor Turnover

Labor turnover is the gross movement of wage and salary workers into and out of employment status with respect to individual establishments. This movement, which relates to a calendar month, is divided into two broad types: Accessions (new hires and rehires) and separations (terminations of employment initiated by either employer or employee). Each type of action is cumulated for a calendar month and expressed as a rate per 100 employees. The data relate to all employees, whether full- or part-time, permanent or temporary, including executive, office, sales, other salaried personnel, and production workers. Transfers to another establishment of the company are included beginning with January 1959.

Separations are terminations of employment during the calendar month and are classified according to cause: Quits, layoffs, and other separations, as defined below.

Quits are terminations of employment initiated by employees, failure to report after being hired, and unauthorized

absences, if on the last day of the month the person has been absent more than 7 consecutive calendar days.

Layoffs are suspensions without pay lasting or expected to last more than 7 consecutive calendar days, initiated by the employer without prejudice to the worker.

Other separations, which are not published separately but are included in total separations, are terminations of employment because of discharge, permanent disability, death, retirement, transfers to another establishment of the company, and entrance into the Armed Forces expected to last more than 30 consecutive calendar days.

Accessions are the total number of permanent and temporary additions to the employment roll including both new and rehired employees.

New hires are temporary or permanent additions to the employment roll of former employees not recalled by the employer, or persons who have never before been employed in the establishment, except for those transferred from other establishments of the company.

Other accessions, which are not published separately but are included in total accessions, are all additions to the employment roll which are not classified as new hires.

Comparability With Employment Series

Month-to-month changes in total employment in manufacturing industries reflected by labor turnover rates are not comparable with the changes shown in the Bureau's employment series for the following reasons: (1) Accessions and separations are computed for the entire calendar month; the employment reports refer to the pay period ending nearest the 15th of the month; (2) the turnover sample excludes certain industries (see Coverage, p. 5-E); (3) plants on strike are not included in the turnover computations beginning with the month the strike starts through the month the workers return; the influence of such stoppages is reflected, however, in the employment figures.

STATISTICS FOR STATES AND AREAS

State and area employment, hours, earnings, and labor turnover data are collected and prepared by State agencies in cooperation with BLS. Additional industry detail may be obtained from the State agencies listed on the inside back cover. These statistics are based on the same establishment reports used by BLS for preparing national estimates. For employment, the sum of the State figures may differ slightly from the equivalent official U.S. totals because of differences in the timing of benchmark adjustments, slightly varying methods of computation, and, since January 1959, a different classification system. (See Industrial Classification, p. 5-E.)

For Alaska and Hawaii, satisfactory employment estimates cannot be derived by subtracting the U.S. totals without Alaska and Hawaii from the totals including the 2 new States.

ESTIMATING METHODS

The procedures used for estimating industry employment, hours, earnings, and labor turnover statistics are summarized in the following table. Details are given in the appropriate technical notes, which are available on request.

**Summary of Methods for Computing Industry Statistics
on Employment, Hours, Earnings, and Labor Turnover**

Item	Individual manufacturing and nonmanufacturing industries	Total nonagricultural divisions, major groups, and groups
Monthly Data		
All employees	All-employee estimate for previous month multiplied by ratio of all employees in current month to all employees in previous month, for sample establishments which reported for both months.	Sum of all-employee estimates for component industries.
Production or nonsupervisory workers; Women employees	All-employee estimate for current month multiplied by (1) ratio of production or nonsupervisory workers to all employees in sample establishments for current month, (2) ratio of women to all employees.	Sum of production- or nonsupervisory-worker estimates, or women estimates, for component industries.
Gross average weekly hours	Production- or nonsupervisory-worker man-hours divided by number of production or nonsupervisory workers.	Average, weighted by production- or nonsupervisory-worker employment, of the average weekly hours for component industries.
Average weekly overtime hours	Production-worker overtime man-hours divided by number of production workers.	Average, weighted by production-worker employment, of the average weekly overtime hours for component industries.
Gross average hourly earnings	Total production- or nonsupervisory-worker payroll divided by total production- or nonsupervisory-worker man-hours.	Average, weighted by aggregate man-hours, of the average hourly earnings for component industries.
Gross average weekly earnings	Product of gross average weekly hours and average hourly earnings.	Product of gross average weekly hours and average hourly earnings.
Labor turnover rates (total, men, and women)	The number of particular actions (e.g., quits) in reporting firms divided by total employment in those firms. The result is multiplied by 100. For men (or women), the number of men (women) who quit is divided by the total number of men (women) employed.	Average, weighted by employment, of the rates for component industries.
Annual Average Data		
All employees and production or nonsupervisory workers	Sum of monthly estimates divided by 12.	Sum of monthly estimates divided by 12.
Gross average weekly hours	Annual total of aggregate man-hours (production- or nonsupervisory-worker employment multiplied by average weekly hours) divided by annual sum of employment.	Average, weighted by production- or nonsupervisory-worker employment, of the annual averages of weekly hours for component industries.
Average weekly overtime hours	Annual total of aggregate overtime man-hours (production-worker employment multiplied by average weekly overtime hours) divided by annual sum of employment.	Average, weighted by production-worker employment, of the annual averages of weekly overtime hours for component industries.
Gross average hourly earnings	Annual total of aggregate payrolls (production- or nonsupervisory-worker employment multiplied by weekly earnings) divided by annual aggregate man-hours.	Average, weighted by aggregate man-hours, of the annual averages of hourly earnings for component industries.
Gross average weekly earnings	Product of gross average weekly hours and average hourly earnings.	Product of gross average weekly hours and average hourly earnings.
Labor turnover rates	Sum of monthly rates divided by 12.	Sum of monthly rates divided by 12.
