## CAUTION

Periodically, the Bureau adjusts the industry employment series to a recent benchmark to improve their accuracy. These adjustments may also affect the hours and earnings series because employment levels are used as weights. Data from April 1965 forward are subject to revision at the time of the next benchmark adjustment. Beginning with September 1966 and subsequent issues of Employment and Earnings and Monthly Report on the Labor Force, national data in Sections B, C, and D are based on March 1965 benchmarks. Comparable data for prior periods are published in Employment and Earnings Statistics for the United States, 1909-66, BLS Bulletin 1312-4.

For further information regarding benchmark adjustments and other aspects of the program, the user is referred to the technical note at the back of this volume.
${ }^{1}$ Quarterly data included in February, May, August, and November issues.

## 1967 Edition of State and Area Data Book Now Available

The Bureau of Labor Statistics has just released the fifth edition of its State and area data book--Employment and Earnings Statistics for States and Areas, 1939-66, BLS Bulletin 1370-4. This publication replaces BLS Bulletin 1370-3, which was issued last year.

As an information source book, it has proved especially useful to plant location specialists, market research teams, analysts for trade associations, and economists interested in State, area, and regional comparisons. The bulletin provides an economic profile of States and areas, revealing the changing geography of American industry.

The new report ( 876 pages) includes data on nonagricultural payroll employment and on the hours and earnings of production workers in all States and 202 metropolitan areas. Twenty-three of these areas are included for the first time in this edition. They are: Santa Rosa, Calif.; Augusta, Ga.; Columbus, Ga.; Chicago-Northwestern Indiana, Ill. (Standard Consolidated Area); Sioux City, Iowa; Waterloo, Iowa; Lexington, Ky.; Battle Creek, Mich.; Bay City, Mich.; Jackson, Mich.; St. Joseph, Mo.; Springfield, Mo.; Las Vegas, Nev.; Monroe County, N.Y.; Rockland County, N.Y.; Asheville, N.C.; Raleigh, N.C.; Amarillo, Texas; Galveston-Texas City, Texas; Lubbock, Texas; Waco, Texas; Wichita Falls, Texas; and Lynchburg, Va.

Annual averages are shown from the earliest date of availability for more than 7,500 employment series and 3,300 series on hours and earnings by industry. All have been adjusted to the latest available benchmarks and are comparable with the monthly data currently published by State agencies cooperating with the BLS.

Complementing the main body of statistics are summary and analytical items, information on area definitions, and a brief technical description of the data.

The bulletin may be purchased from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 or from any of the BLS regional offices, for $\$ 5.00$ a copy. (See order form on page 116).

# Summary Employment And Unemployment DEVELOPMENTS, JULY 1967 

Employment increased more than usual in July, while unemployment showed about the expected June-to-July drop. The total unemployment rate, at 3.9 percent, was practically unchanged from a month earlier or from the July 1966 rate.

Employment, which had declined earlier in 1967, has recovered steadily in the last 2 months, more than regaining the earlier losses. Nonfarm payroll employment (seasonally adjusted) rose by 200,000 in July, following an increase of 250,000 in June. Total employment (from the household survey) has also moved up strongly in the last 2 months.

## The Summer Youth Situation

A total of 12.5 million 16 to 21 yearolds were working or seeking work in the summer of 1967 (June-July average). This was an over-the-year rise of 500,000 and an increase of 1.9 million from the 1964 summer level. Population expansion in this age group (the youngsters born in the years following World War II) accounts for a large part of the 1964-67 labor force growth. At the same time, there has been a steady rise in youth labor force participation rates-from 60.7 percent of the civilian population in June and July 1964 to 65.1 percent in the summer of 1967 . Since the summer of 1964 , participation rates have moved up strongly for both white and nonwhite (mainly Negro) youth. (See table on page 5.)

Summer employment of 16 to 21 yearolds rose by about 400,000 over the year to 10.8 million. The service-producing sector of the private economy, up 300,000 , accounted for a large part of the over-the-year gain. On the other hand, in
the goods-producing industries, where activity has been sluggish so farin 1967, youth employment was unchanged over the year, in contrast to a 400,000 increase between the summers of 1965 and 1966.

Approximately 175,000 more 16 to 21 year-olds worked for Federal, State and local governments in June and July of 1967 than in the same months of 1966. Government employment of 16 to 21 yearolds almost doubled between the summers of 1964 and 1967-rising from 600,000 to $1,150,000$.

The 1966-67 summer employment pickup for youth just about matched their labor force expansion, leaving unemployment virtually unchanged. So far this summer, the unemployment rate for 16 to .21 year-olds has been 13.4 percent, very close to last summer's 13.5 percent. These rates, however, are well below the 1964 and 1965 June-July averages, 16.4 and 15.2 percent, respectively. The rate for white youth was about 12 percent in both 1966 and 1967, while the nonwhite youth rate remained close to 25 percent.

## Industry Employment Developments

The better-than-seasonal pickup in payroll employment $(200,000)$ was concentrated in government and in miscellaneous services, but all sectors except manufacturing showed small increases. In manufacturing, there was a seasonally adjusted employment decline of 40,000 . Losses in transportation equipment $(35,000)$ and apparel $(20,000)$ offset gains in several other manufacturing industries. The decline in transportation equipment was attributable to strikes in the shipbuilding industry and to the early start of the automobile model changeover. The employment pickup in elec-

NOTE: Totals may not add because of independent rounding.
trical equipment ( 25,000 seasonally adjusted) reflected primarily the return to work of persons on strike last month.

After seasonal adjustment, manufacturing employment totaled 19.1 million in July, down 300,000 from the January peak. Despite this decrease, indicators of future activity point to a strengthening of demand. New orders in manufacturing, which recovered sharply in May, moved up further in June. Retail sales have picked up recently but the inventory-sales ratio remains high.

Contract construction employment rose 35,000 more than usual in July, but the increase was largely a reflection of the return to work of persons on strike in June. In the last 5 months, construction employment has been well below the year earlier levels.

Most of the service-producing industries have showed steadyemployment increases in recent months. After seasonal adjustment, May-to-July job gains amounted to about 150,000 in State and local government, 100,000 in services, and 50,000 in trade. There were over-the-year pickups of approximately 400,000 in trade, and 500,000 each in services and State and local government.

## Hours and Earnings

In July, the workweek for nonsupervisory employees on private nonagricultural payrolls averaged 38.4 hours, down from 39.0 hours in July 1966. Hourly and weekly earnings for these 45 million workers were $\$ 2.66$ and $\$ 102.14$, up 10 cents and $\$ 2.30$ respectively, over the year.

The manufacturing workweek averaged 40.3 hours in July, down 0.7 hour from a year earlier. After seasonal adjustment, the factory workweek has remained between 40.2 and 40.5 hours since

February, down sharply from the highs recorded in the summer and fall of 1966. Hourly earnings for factory workers, at $\$ 2.81$, were unchanged over the month, but up 10 cents--or 3.7 percent--over the year. Because of the drop in hours, weekly earnings, at $\$ 113.24$, showed a relatively smaller over-the-year in-crease--1.9 percent.

Weekly manhours in manufacturing, mining, and construction, which declined from January to May, have increased more than seasonally in the last 2 months.

## Unemployment

There were a total of $3,250,000$ per sons unemployed in July 1967, an inc rease of 200,000 from the July 1966 level. All of the over-the-year rise took place among teenagers and adult women. About one-fourth of the 1.2 million unemployed teenagers and one-fifth of the 1.1 million jobless adult women were seeking parttime jobs in July 1967. In contrast, only one-tenth of the 1.0 million unemployed adult men wanted part-time work.

The jobless rate for men age 20 and over, which had increased from 2.2 percent in early 1967 to 2.6 percent in June, declined to 2.4 percent in July. For adult women and teenagers, the July unemployment rates ( 4.3 and 12.6 percent) were unchanged over the month.

The unemployment rate for nonwhite workers, which had risen from 7.0 to 7.7 percent between the first and second quarters of this year, dropped back to 7.2 percent in July. Despite this drop, the nonwhite unemployment rate remained about twice as highas the rate for whites, as it has for the past 13 years.

## Insured Unemployment

State insured unemployment showed
a greater-than-seasonal rise between

June and July, and the insured jobless rate moved up from 2.6 to 2.8 percent. Most of the rise was attributable to early model changeover layoffs in the automobile industry.

The recent slowdown in manufactur ing activity has been reflected in the insured jobless figures, as well as in manufacturing unemployment. The State insured jobless rate moved up from 2.2 percent in late 1966 to 2.8 percent in July 1967. Similarly, the manufacturing jobless rate rose from 2.9 percent in the fourth quarter of 1966 to about 4.0 percent in the last 3 months.

Seasonally adjusted, the insured unemployed volume was at 1.4 million,
compared with 1.3 million in mid-June and 1.1 million in mid-July of 1966 . Fortyone States reported increased insured unemployment from the June survey week, with the most substantial increases occurring in Michigan (42,700), Massachusetts (17,700), New. York (16,000), New Jersey ( 13,000 ), Connecticut $(10,800)$, and Pennsylvania $(10,700)$.

Compared with the year-earlier figures, insured unemployment was higher in 44 States. Michigan, Pennsylvania, and California reported the largest in-creases-34,100, 20,800, and 20,200, respectively.

1 Combined with service.
2 Combined with construction.
3 Federal ermloyment in laryland and Virginia sectors of the Washington Standard Netropolitan Statistical Area
is included in data for the District of Columbia.
${ }^{4}$ Initial inclusion in this publication. (See area'definition on opposite page.)
5 Area included in Chicago-Northwestern Indiana Standard Consolidated Area.
${ }^{6}$ Not availeble.
7 Combinea with manufacturing.
${ }^{8}$ Area included in New York-Northeastern New Jersey Standard Consolidated Area.
9 Subarea of Rochester Standard Metropolitan Statistical Area.
10 Subarea of New York Standard Metropolitan Statistical Area.
11 Total includes data for industry divisions not shom separately. NOTL: Data for the current month are preliminary.
SOURCE: Cooperating State agencies listed on inside back cover.

NOTE: Data for the 2 most recent months are preliminary.

C-2: Gross hours and earnings of production workers,' by industry.-Continued

${ }^{1}$ For coverage of series, see footnote 1 , table B-2.
2 Beginning January 1965, data relate to railroads with operating revenues of $\$ 5,000,000$ or more. January 1967: $\$ 137.49, \$ 3.19$, and 43.1; February 1967: $\$ 143.77, \$ 3.26$, and 44.1.
${ }^{3}$ Data relate to employees in such occupations in the telephone industry as switchboard operators; service assistants; operating room instructors; and pay-station attendants. In 1965, such employees made up 33 percent of the total number of nonsupervisory employees in establishments reporting hours and earninge data.
${ }^{4}$ Data relate to employees in such occupations in the telephone industry as central office craftsmen; installation and exchange repair craftsmen; line, caisle, and conduit craftsmen; and laborers. In 1965, such employees made up 33 percent of the total number of nonsupervisory employees in establishments reporting hours and earnings data.
${ }^{5}$ Data relate to nonsupervisory employees except messengers.
6 Money payments only; tips, not included.
7 Data for nonoffice salesmen excluded from all series in this division. *Not available.
NOTE: Data for the 2 most recent months are preliminary.

${ }_{2}^{1}$ Derived by assuming that overime hours are paid at the rate of cime and onechalf.
Not available as average overtime rates are significaotly above cime and one-balf. Inclusion of data for che group in the noadurable goods total has litcle effect.
NOTE: Data for the 2 wost recent monchs are prelimioary.
C.5: Gross and spendable average weekly earnings of production or nonsupervisory workers ${ }^{1}$ on private nonagricultural payrolls, in current and $1957-59$ dollars

${ }^{1}$ For coverage of series, see footnote 1 , table B-2.
NOTE: Data for the current month are preliminary.
C.6: Indexes of aggregate weekly man-hours and payrolls in industrial and construction activities ${ }^{1}$

${ }^{1}$ Beginning with January 1959, transfers between establishments of the same firm are included in total accessions and total separations, therefore rates for these iteras are not strictly comparable with prior daca. Transfers comprise part of orber accessions and other separations, the rates for which are not shown separately.

NOTE: Data include Alaska and Hawaii beginning 1959. This inclusion has not significantly affected the labor turnover series.
Data for the current month are preliminary.

D-2: Labor turnover rates, by industry

${ }^{1}$ Beginning with January 1959, transfers berween establishments of the same firm are included in total accessions and total separations, therefore rates for these items are not strictly comparable with prior data. Transfers comprise part of other accessions and ocher separations, the rates for which are not shown separately.

NOTE: Data include Alaska and Hawaii beginning 1959. This inclusion has not significantly affected the labor turnover series.
Data for the current montb are preliminary.

E-2: Insured unemployment ${ }^{1}$ in 150 major labor areas ${ }^{2}$

${ }^{1}$ Insured jobless under State, Federal Employee, and Ex-Servicemen's unemployment insurance prograns.
${ }^{2}$ For full name of labor area, see Area Trends in Employment and Unemployment published by the Bureau of Employnent Security.
*Excludes insured unemployed under extended duration provisions of regular State laws.

Additional information concerning the preparation of the labor force, employment, hours and earnings, and labor turnover series--concepts and scope, survey methods, and limitations--is contained in technical notes for each of these series, available from the Bureau of Labor Statistics free of charge.

## INTRODUCTION

The statistics in this periodical are compiled from three major sources: (1) household interviews, (2) payroll reports from employers, and (3) administrative statistics of unemployment insurance systems.

Data based on household interviews areobtained from a sample survey of the population 16 years of age and over. The survey is conducted each month by the Bureau of the Census for the Bureau of Labor Statistics and provides comprehensive data on the labor force, the employed and the unemployed, including such characteristics as age, sex, color, marital status, occupations, hours of work, and duration of unemployment. The survey also provides data on the characteristics and past work experience of those not in the labor force. The information is collected by trained interviewers from a sample of about 52,500 households, representing 449 areas in 863 counties and independent cities, with coverage in 50 States and the District of Columbia. The data collected are based on the activity or status reported for the calendar week including the 12 th of the month.

Data basedon establishment payroll records are compiled each month from mail questionnaires by the Bureau of Labor Statistics, in cooperation with State agencies. The payroll survey provides detailed industry information on nonagricultural wage and salary employment, average weekly hours, average hourly and weekly earnings, and labor turnover for the Nation, States, and metropolitan areas. The figures are based on payroll reports from a sample of establishments employing about 25 million nonfarm wage and salary workers. The data relate to all workers, full- or part-time, who received pay during the payroll period which includes the 12 th of the month.

Data based on administrative records of unemployment insurance systems furnish a complete count of insured unemployment among the two-thirds of the Nation's labor force covered by unemployment insurance programs. Weekly reports, by State, are issued on the number of initial claims, the volume and rate of insured unemployment under State unemployment insurance programs, and the volume under programs of unemployment compensation for Federal employees, ex-servicemen, and railroad workers. These statistics are published by the Bureau of Employment Security, U.S. Department of Labor, in "Unemployment Insurance Claims."

## Relation between the household and payroll series

The household and payroll data supplement one another, each providing significant types of information that the other cannot suitably supply. Population characteristics, for example, are readily obtained only from the household survey whereas detailed industrial classifications can be reliably derived only from establishment reports.

Data from these two sources differ from each other because of differences in definition and coverage, sources of information, methods of collection, and estimating procedures. Sampling variability and response errors are additional reasons for discrepancies. The major factors which have a differential effect on levels and trends of the two series are as follows:

## Employment

Coverage. The household survey definition of employment comprises wage and salary workers (including domestics and other private household workers), selfemployed persons, and unpaid workers who worked 15 hours or more during the survey week in family-operated enterprises. Employment in both farm and nonfarm industries is included. The payroll survey covers only wage and salary employees on the payrolls of nonfarm establishments.

Multiple jobholding. The household approach provides information on the work status of the population without duplication since each person is classified as employed, unemployed, or not in the labor force. Employed persons holding more than one job are counted only once and are classified according to the job at which they worked the greatest number of hours during the survey week. In the figures based on establishment records, persons who worked in more than one establishment during the reporting period are counted each time their names appear on payrolls.

Unpaid absences from jobs. The household survey includes among the employed all persons who had jobs but were not at work during the survey week--that is, were not working but had jobs from which they were temporarily absent because of illness, bad weather, vacation, labor-management dispute, or because they were taking time off for various other reasons, even if they were not paid by their employers for the time off. In
the figures based on payroll reports, persons on leave paid for by the company are included, but not those on leave without pay for the entire payroll period.

## Hours of Work

The household survey measures hours actually worked whereas the payroll survey measures hours paid for by employers. In the household survey data, all persons with a job but not at work are excluded from the hours distributions and the computations of average hours. In the payroll survey, employees on paid vacation, paid holiday, or paid sick leave are included and assigned the number of hours for which they were paid during the reporting period.

## Comparability of the household interview data with other series

Unemployment insurance data. The unemployed total from the household survey includes all persons who did not have a jobat all during the survey week and were looking for work or were waiting to be called back to a job from which they had been laid off, regardless of whether or not they were eligible for unemployment insurance. Figures on unemployment insurance claims, prepared by the Bureau of Employment Security of the Department of Labor, exclude persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (agriculture, State and local government, domestic service, self employment, unpaid family work, nonprofitorganizations, and firms below a minimum size).

In addition, the qualifications for drawing unemployment compensation differ from the definition of unemployment used in the household survey. For example, persons with a job but not at work and persons working only a few hours during the week are sometimes eligible for unemployment compensation but are classified as employed rather than unemployed in the household survey.

Agricultural employment estimates of the Department of Agriculture. The principal differences in coverage
are the inclusion of persons under 16 in the Statistical Research Service (SRS) series and the treatment of dual jobholders who are counted more than once if they worked on more than one farm during the reporting period. There are also wide differences in sampling techniques and collecting and estimating methods, which cannot be readily measured in terms of impact on differences in level and trend of the two series.

## Comparability of the payroll employment data with other series

Statistics on manufactures and business, Bureau of the Census. BLS establishment statistics on employment differ from employment counts derived by the Bureau of the Census from its censuses or annual sample surveys of manufacturing establishments and the censuses of business establishments. The major reasons for some noncomparability are different trearment of business units considered parts of an establishment, such as central administrative offices and auxiliary units, the industrial classification of establishments, and different reporting patterns by multiunit companies. There are also differences in the scope of the industries covered, e.g., the Census of Business excludes contract construction, professional services, public utilities, and financial establishments, whereas these are included in BLS statistics.

County Business Patterns. Data in County Business Patterns, published jointly by the U.S. Departments of Commerce and Health, Education, and Welfare, differ from BLS establishment statistics in the treatment of central administrative offices and auxiliary units. Differences may also arise because of industrial classification and reporting practices. In addition, CBP excludes interstate railroads and government, and coverage is incomplete for some of the nonprofit activities.

Employment covered by State unemployment insurance programs. Not all nonfarm wage and salary workers are covered by the unemployment insurance programs. All workers in certain activities, such as interstate railroads, are excluded. In addition, small firms in covered industries are also excludéd in 32 States. In general, these are establishments with less than four employees.

## Labor Force Data

## COLLECTION AND COVERAGE

Statistics on the employment status of the population, the personal, occupational, and other characteristics of the employed, the unemployed, and persons not in the labor force, and related data are compiled for the BLS by the Bureau of the Census in its Current Population Survey (CPS). A detailed description of this survey appears in "Concepts and Methods Used in Manpover Statistics from the Current Population Survey" (BLS Re-
port 313). This report is available from BLS on request.

These monthly surveys of the population are conducted with a scientifically selected sample designed to represent the civilian noninstitutional population 16 years and over. Respondents are interviewed to obtain information about the employment status of each member of the household 16 years of age and over. The inquiry relates to activity or status during the calendar week,

Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted in the following week.

Inmates of institutions and persons under 16 years of age are not covered in the regular monthly enumerathons and are excluded from the population and labor force statistics shown in this report. Data on members of the Armed Forces, who are included as part of the categories "total noninstitutional population" and "total labor force," are obtained from the Department of Defense.

Each month, 52,500 occupled units are designated for interview. About 2,250 of these households are visited but interviews are not obtained because the occupants are not found at home after repeated calls or are unavailable for other reasons. This represents a noninterview rate for the survey of about 4.5 percent. In addition to the 52,500 occupled units, there are 8,500 sample units in an average month which are visited but found to be vacant or otherwise not to be enumerated. Part of the sample is changed each month. The rotation plan provides for three-fourths of the sample to be common from one month to the next, and one-half to be common with the same month a year ago.

## CONCEPTS

Employed persons comprise (a) all those who during the survey week did any work at all as paid employees, in their own business, profession, or farm, or who worked 15 hours or more as unpaid workers in an enterprise operated by a member of the family, and (b) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, labor-management dispute, or personal reasons, whether or not they were paid by their employers for the time off, and whether or not they were seeking other jobs.

Each employed person is countedonly once. Those who held more than one job are counted in the job at which they worked the greatest number of hours during the survey week.

Included in the total are employed citizens of foreign countries, temporarily in the United States, who are not living on the premises of an Embassy.

Excluded are persons whose only activity consisted of work around the house (such as own home housework, and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations.

Unemployed persons comprise all persons who did not work during the survey week, who made specific efforts to find a job within the past 4 weeks, and who were available for work during the survey week (except for temporary illness). Also included as unemployed are those who did not work at all, were available for work, and (a) were waiting to be called back to a job from which they had been laid off; or (b) were waiting to report to a new wage or salary job within 30 days.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of seeking work. Average duration is an arithmetic mean computed from a distribution by single weeks of unemployment.

The civilian labor force comprises the total of all civilians classified as employed or unemployed in accordance with the criteria described above. The "total labor force" also includes members of the Armed Forces stationed either in the United States or abroad.

The unemployment rate represents the number unemployed as a percent of the civilian labor force. This measure can also be computed for groups within the labor force classified by sex, age, marital status, color, etc.

Not in labor force includes all civilians 16 years and over who are not classified as employed or unemployed. These persons are further classified as "engaged in own home housework," "in school," "unable to work" because of long-term physical or mental illness, and "other." The "other" group includes for the most part retired persons, those reported as too old to work, the voluntarily idle, and seasonal workers for whom the survey week fell in an "off" season and who were not reported as unemployed. Persons doing only incidental unpaid family work (less than 15 hours) are also classified as not in the labor force.

For persons not in the labor force, data on previous work experience, intentions to seek work again, desire for a job at the time of interview, and reasons for not looking for work are complled on a quarterly basis. The detalled questions for persons not in the labor force are asked only in those households that are new entrants to the sample and in those that are reentering the sample after 8 months' absence.

Occupation, industry, and class of worker for the employed apply to the job held in the survey week. Persons with two or more jobs are classified in the job at which they worked the greatest number of hours during the survey week. The unemployed are classified according to their latest full-time civilian job lasting 2 weeks or more. The occupation and industry groups used in data derived from the CPS household interviews are defined as in the 1960 Census of Population. Information on the detailed categories included in these groups is available upon request.

The class-of-worker breakdown specifies "wage and salary workers," subdivided into private and government workers, "self-employed workers," and "unpaid family workers." Wage and salary workers receive wages, salary, commission, tips, or pay in kind from a private employer or from a governmental unit. Self-employed persons are those who work for profit or fees in their
own business, profession, or trade, or operate a farm. Unpaid family workers are persons working without pay for 15 hours a week or more on a farm or in a business operated by a member of the household to whom they are related by blood or marriage.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, a person who normally works 40 hours a week but who was off on the Veterans Day holiday would be reported as working 32 hours even though he was paid for the holiday.

For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the week. However, all the hours are credited to the major job.

Persons who worked 35 hours or more in the survey week are designated as working "full time"; persons who worked between 1 and 34 hours are designated as working "part time." Part-time workers are classified by their usual status at their present job (either full time or part time) and by their reason for working part time during the survey week (economic or other reasons). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. "Other reasons" include: Labor dispute, bad weather, own illness, vacation, demands of home housework, school, no desire for full-time work, and full-time worker only during peak season. Persons on full-time schedules include, in addition to those working 35 hours or more, those who worked from 1-34 hours for noneconomic reasons but usually work full time.

Full-and part-time labor force. The full-time labor force consists of persons working on full-time schedules, persons involuntarily working part time (because fulltime work is not available), and unemployed persons seeking full-time jobs. The part-time labor force consists of persons working part time voluntarily and unemployed persons seeking part-time work. Persons with a job but not at work during the survey week are classified according to whether they usually work full or part time.

Labor force time lost is a measure of man-hours lost to the economy through unemployment and involuntary part-time employment and is expressed as a percent of potentially available man-hours. It is computed by assuming: (1) that unemployed persons looking for full-time work lost an average of 37.5 hours, (2) that those looking for parttime work lost the average number of hours actually worked by voluntary part-time workers during the survey week, and (3) that persons on part time for economic reasons lost the difference between 37.5 hours and the actual number of hours they worked.

## ESTIMA TING METHODS

Under the estimation methods used in the CPS, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. There are no subsequent adjustments to independent benchmark data on labor force, employment, or unemployment. Therefore, revisions of the historical data are not an inherent feature of this statistical program.

1. Noninterview adjustment. The weights for all interviewed households are adjusted to the extent needed to account for occupied sample households for which no information was obtained because of absence, impassable roads, refusals, or unavailability for other reasons. This adjustment is made separately by groups of sample areas and, within these, for six groups--color (white and nonwhite) within the three residence categories (urban, rural nonfarm, and rural farm). The proportion of sample households not interviewed varies from 4 to 6 percent depending on weather, vacations, etc.
2. Ratio estimates. The distribution of the population selected for the sample may differ somewhat, by chance, from that of the Nation as a whole, in such characteristics as age, color, sex, and residence. Since these population characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio estimates as follows:
a. First-stage ratio estimate. This is a procedure in which the sample proportions are weighted by the known 1960 Census data on the color-residence distribution of the population. This step takes into account the differences existing at the time of the 1960 Census between the color-residence distribution for the Nation and for the sample areas.
b. Second-stage ratio estimate. In this step, the sample proportions are weighted by independent current estimates of the population by age, sex, and color. These estimates are prepared by carrying forward the most recent census data (1960) to take account of subsequent aging of the population, mortality, and migration between the United States and other countries.
3. Composite estimate procedure. In deriving statistics for a given month, a composite estimating procedure is used which takes account of net changes from the previous month for continuing parts of the sample ( 75 percent) as well as the sample results for the current month. This procedure reduces the sampling variability of month-to-month changes especially and of the levels for most items also.

## Rounding of Estimates

The sums of individual items may not always equal the totals shown in the same tables because of independent rounding of totals and components to the nearest thousand. Differences, however, are insignificant.

## Reliability of the Estimates

Since the estimates are based on a sample, they may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures.

The standard error is a measure of sampling variability, that is, the variations that might occur by chance because only a sample of the population is surveyed. The chances are about 2 out of 3 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 19 out of 20 that the difference would be less than twice the standard error.

Table A shows the average standard error for the major employment status categories, by sex, computed from data for past months. Estimates of change derived from the survey are also subject to sampling variability'. The standard error of change for consecutive months is also shown in table $A$. The standard errors of level shown in table A are acceptable approximations of the standard errors of year-to-year change.

The figures presented in table B are to be used for other characteristics and are approximations of the standard errors of all such characteristics. They should be interpreted as providing an indication of the order of magnitude of the standard errors rather than as the precise standard error for any specific item.

The standard error of the change in an item from one month to the next month is more closely related to the standard error of the monthly level for that item than to the size of the specific month-to-month change itself. Thus, in order to use the approximations to the standard errors of month-to-month changes as presented in table $C$, it is first necessary to obtain the standard error of the monthly level of the item in table $B$, and then find the standard error of the month-to-month change in table $C$ corresponding to this standard error of level. It should be noted that table $C$ applies to estimates of change between 2 consecutive months. For changes between the current month and the same month last year, the standard errors of level shown in table $B$ are acceptable approximations.

Table B. Standard error of level of monthly estimates
(In thousands)

| Size of estimate | Both sexes |  | Male |  | Female |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { Total } \\ & \text { or } \\ & \text { white } \end{aligned}$ | Nonwhite | $\begin{aligned} & \text { Total } \\ & \text { or } \\ & \text { white } \end{aligned}$ | Nonwhite | Total or white | Nonwhite |
| 10 | 4 | 4 | 6 | 4 | 6 | 4 |
| 50 | 9 | 9 | 11 | 9 | 11 | 9 |
| 100 | 12 | 12 | 16 | 12 | 16 | 12 |
| 250 | 20 | 17 | 25 | 17 | 25 | 17 |
| 500 | 30 | 25 | 34 | 25 | 34 | 25 |
| 1,000 | 40 | 35 | 50 | 35 | 50 | 35 |
| 2,500 . . . | 60 | 40 | 75 | 40 | 75 | 40 |
| 5,000 | 85 | 45 | 90 | $\ldots$ | 90 | . $\cdot$ |
| 10,000 | 115 | ... | 115 | ... | 115 | . $\cdot$ |
| 20,000 | 150 | . $\cdot$ - | 125 | ... | 125 | -• |
| 30,000 | 170 | $\ldots$ | ... | ... | ... | -•• |
| 40,000 | 180 | . $\cdot$ | -• | -•• | . . | . $\cdot$ |

Illustration: Assume that the tables showed the total number of persons working a specific number of hours as $15,000,000$, an increase of 500,000 over the previous month. Linear interpolation in the first column of table B shows that the standard error of $15,000,000$ is about 133,000. Consequently, the chances are about 68 out of 100 that the sample estimate differs by less than 133,000 from the figure which would have been obtained from a complete count of the number of persons working the given number of hours. Using the 133,000 as the standard
error of the monthly level in table $C$, it may be seen that the standard error of the 500,000 increase is about 126,000.

Table C. Standard error of estimates of month-to-month change (In thousands)

| Standard error of monthly level | Standard error of month-$\mathrm{t}^{n}$-month change |
| :---: | :---: |
| 10................................ | 12 |
| 25................................. | 28 |
| 50................................ | 55 |
| 100............................... | 100 |
| 150............................... | 140 |
| 200 ............................... | 155 |
| 250............................... | 160 |
| 300 ................................. | 190 |

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Where the numerator is a subclass of the denominator, estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerator
of the percentage, particularly if the percentage is large (50 percent or greater). Table $D$ shows the standard errors for percentages derived from the survey. Linear interpolation may be used for percentages and base figures not shown in table $D$.

Table D. Standard error of percentage

## Establishment Data

## COLLECTION

Payroll reports provide current information on wage and salary employment, hours, earnings, and labor turnover in nonfarm establishments, by industry and geographic location.

## Federal-State Cooperation

Under cooperative arrangements with State agencies, the respondent fills out only one employment or labor turnover schedule, which is then used for national, State, and area estimates. This eliminates duplicate reporting on the part of respondents and, together with the use of identical techniques at the national and State levels, insures maximum comparability of estimates.

State agencies mail the forms to the establishments and examine the returns for consistency, accuracy, and completeness. The States use the information to prepare State and area series and then send the data to the BLS for use in preparing the national series.

## Shuttle Schedules

Two types of data collection schedules are used: Form BLS 790--Monthly Report on Employment, Payroll, and Hours; and Form DL 1219--Monthly Report
on Labor Turnover. These schedules are of the "shuttle" type, with space for each month of the calendar year. The schedule is returned to the respondent each month by the collecting agency so that the next month's data can be entered. This procedure assures maximum comparability and accuracy of reporting, since the respondent can see the figures he has reported for previous months.

The BLS 790 provides for entry of data on the number of full- and part-time workers on the payrolls of nonagricultural establishments and, for most industries, payroll and man-hours of production and related workers or nonsupervisory workers for the pay period which includes the 12 th of the month. The labor turnover schedule provides for the collection of information on the total number of accessions and separations, by type, during the calendar month.

## CONCEPTS

## Industrial Classification

Establishments are classified into industries on the basis of their principal product or activity determined from information on annual sales volume. This information is collected each year on a supplement to the
monthly. 790 or 1219 report. For an establishment making more than one product or engaging in more than one activity, the entire employment of the establishment is included under the industry indicated by the most important product or activity.

All national, State, and area employment, hours, earnings, and labor turnover series are classified in accordance with the Standard Industrial Classification Manual: Bureau of the Budget, 1957, as amended by the 1963 Supplement.

## Industry Employment

Employment data except that for the Federal Government refer to persons on establishment payrolls who received pay for any part of the pay period which includes the 12th of the month. For Federal Government establishments, employment figures represent the number of persons who occupied positions on the last day of the calendar month. Intermittent workers are counted if they performed any service during the month.

The data exclude proprietors, the self-employed, unpaid family workers, farm workers, and domestic workers in households. Salaried officers of corporations are included. Government employment covers only civilian employees; Federal military personnel are excluded from total nonagricultural employment.

Persons on an establishment payroll who are on paid sick leave (when pay is received directly from the firm), on paid holiday or paid vacation, or who work during a part of the pay period and are unemployed or on strike during the rest of the period, are counted as employed. Not counted as employed are persons who are laid off, on leave without pay, or on strike for the entire period, or who are hired but do not report to work during the period.

## Industry Hours and Earnings

Hours and earnings data are derived from reports of payrolls and man-hours for production and related workers in manufacturing and mining, construction workers in contract construction, and nonsupervisory employees in the remaining nonfarm components. For Federal Government, hours and eamings relate to all employees who worked or received pay during the pay period which includes the 12 th of the month. Terms are defined below. When the pay period reported is longer than 1 week, figures are reduced to a weekly basis.

Production and related workers include working foremen and all nonsupervisory workers (including leadmen and trainees) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping, maintenance, repair, janitorial and watchman services, product development, auxiliary production for plant's own use (e.go, power plant), and recordkeeping and other services closely associated with the above production operations.

Construction workers include the following employees in the contract construction division: Working foremen, journeymen, mechanics, apprentices, laborers, etc., whether working at the site of construction or in shops or yards, at jobs (such as precutting and preassembling) ordinarily performed by members of the construction trades.

Nonsupervisory employees include employees (not above the working supervisory level) such as office and clerical workers, repairmen, salespersons, operators, drivers, attendants, service employees, linemen, laborers, janitors, watchmen, and similar occupational levels, and other employees whose services are closely associated with those of the employees listed.

Payroll covers the payroll for full- and part-time production, construction, or nonsupervisory workers who received pay for any part of the pay period which includes the 12 th of the month. The payroll is reported before deductions of any kind, e.g., for old-age and unemployment insurance, group insurance, withholding tax, bonds, or union dues; also included is pay for overtime, holidays, vacations, and sick leave paid directly by the firm. Bonuses (unless earned and paid regularly each pay period), other pay not earned in pay period reported (e.g., retroactive pay), and the value of free rent, fuel, meals, or other payment in kind are excluded.

Man-hours cover man-hours worked or paid for, during the pay period which includes the 12th of the month, for production, construction, or nonsupervisory workers. The man-hours include hours paid for holidays and vacations, and for sick leave when pay is received directly from the firm.

Overtime hours cover premium overtime hours of production and related workers during the pay period which includes the 12th of the month. Overtime hours are those for which premiums were paid because the hours were in excess of the number of hours of either the straight-time workday or workweek. Weekend and holiday hours are included only if premium wage rates were paid. Hours for which only shift differential, hazard, incentive, or other similar types of premiums were paid are excluded.

## Gross Average Hourly and Weekly Earnings

Average hourly earnings are on a "gross" basis, reflecting not only changes in basic hourly and incentive wage rates, but also such variable factors as premium pay for overtime and late-shift work, and changes in output of workers paid on an incentive plan. Shifts in the volume of employment between relatively high-paid and low-paid work and changes in workers' earnings in individual establishments also affect the general earnings averages. Averages for groups and divisions further reflect changes in average hourly earnings for individual industries.

Averages of hourly earnings differ from wage rates. Earnings are the actual return to the worker for a stated period of time, while rates are the amounts stipulated for a given unit of work or time. The earnings series, however, does not measure the level of total labor costs on
the part of the employer since the following are excluded: Irregular bonuses, retroactive items, payments of various welfare benefits, payroll taxes paid by employers, and earnings for those employees not covered under the pro-duction-worker, construction worker, or nonsupervisoryemployee definitions.

Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings. Therefore, weekly earnings are affected not only by changes in gross average hourly earnings, but also by changes in the length of the workweek, part-time work, stoppages for varying causes, labor turnover, and absenteeism.

## Average Weekly Hours

The workweek information relates to the average hours for which pay was received, and is different from standard or scheduled hours. Such factors as absenteeism, labor turnover; part-time work, and stoppages cause average weekly hours to be lower than scheduled hours of work for an establishment. Group averages further reflect changes in the workweek of component industries.

## Average Overtime Hours

The overtime hours represent that portion of the gross average weekly hours which were in excess of regular hours and for which premium payments were made. If an employee worked on a paid holiday at regular rates, receiving as total compensation his holiday pay plus straight-time pay for hours worked that day, no overtime hours would be reported.

Since overtime hours are premium hours by definition, gross weekly hours and overtime hours do not necessarily move in the same direction, from month-tomonth; for example, premiums may be paid for hours in excess of the straight-time workday although less than a full week is worked. Diverse trends at the industrygroup level may also be caused by a marked change in gross hours for a component industry where little or no overtime was worked in both the previous and current month. In addition, such factors as stoppages, absenteeism, and labor turnover may not have the same influence on overtime hours as on gross hours.

## Railroad Hours and Earnings

The figures for class I railroads (excluding switching and terminal companies) are based on monthly data summarized in the M-300 report of the Interstate Commerce Commission and relate to all employees who received pay during the month, except executives, officials, and staff assistants (ICC group I). Gross average hourly earnings are computed by dividing total compensation by total hours paid for. Average weekly hours are obtained by dividing the total number of hours paid for reduced to a weekly basis, by the number of employees, as defined above. Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings.

## Spendable Average Weekly Earnings

Spendable average weekly earnings in current dollars are obtained by deducting estimated Federal social security and income taxes from gross weekly earnings. The amount of income tax liability depends on the number of dependents supported by the worker and his marital status, as well as on the level of his gross income. To reflect these variables, spendable earnings are computed for a worker with no dependents, and a married worker with three dependents. The computations are based on the gross average weekly earnings for all production or nonsupervisory workers in the industry division without regard to total family income.
"Real" earnings are computed by dividing the current Consumer Price Index into the earnings averages for the current month. The level of earnings is thus adjusted for changes in purchasing power since the base period (1957-59).

## Average Hourly Earnings Excluding Overtime

Average hourly earnings excluding premium overtime pay are computed by dividing the total productionworker payroll for the industry group by the sum of total production-worker man-hours and one-half of totalovertime man-hours. Prior to January 1956, these data were based on the application of adjustment factors to gross average hourly earnings (as described in the Monthly Labor Review, May 1950, pp. 537-540). Both methods eliminate only the earnings due to overtime paid for at $1 \frac{1}{2}$ times the straight-time rates. No adjustment is made for other premium payment provisions, such as holiday work, late-shift work, and overtime rates other than time and one-half.

## Indexes of Aggregate Weekly Payrolls and Man-Hours

The indexes of aggregate weekly payrolls and manhours are prepared by dividing the current month's aggregate by the monthly average for the 1957-59 period. The man-hour aggregates are the product of average weekly hours and production-worker employment, and the payroll aggregates are the product of gross average weekly earnings and production-worker employment.

## Labor Turnover

Labor turnover is the gross movement of wage and salary workers into and out of employed status with respect to individual establishments. This movement, which relates to a calendar month, is divided into two broad types: Accessions (new hires and rehires) and separations (terminations of employment initiated by either employer or employee). Each type of action is cumulated for a calendar month and expressed as a rate per 100 employees. The data relate to all employees, whether full- or part-time, permanent or temporary, including executive, office, sales, other salaried personnel, and production workers. Transfers to another establishment of the company are included, beginning with January 1959.

Accessions are the total number of permanent and temporary additions to the employment roll, including both new and rehired employees.

New hires are temporary or permanent additions to the employment roll of persons who have never before been employed in the establishment (except employees transferring from another establishment of the same company) or of former employees not recalled by the employer.

Other accessions, which are not published separately but are included in total accessions, are all additions to the employment roll which are not classified as new hires, including transfers from another establishment of the company.

Separations are terminations of employment during the calendar month and are classified according to cause: Quits, layoffs, and other separations, are defined as follows:

Quits are terminations of employment initiated by employees, failure to report after being hired, and unauthorized absences, if on the last day of the month the person has been absent more than 7 consecutive calendar days.

Layoffs are suspensions without pay lasting or expected to last more than 7 consecutive calendar days, initiated by the employer without prejudice to the worker.

Other separations, which are not published separately but are included in total separations, are terminations of employment because of discharge, permanent disability, death, retírement, transfers to another establishment of the company, and entrance into the Armed Forces for a period expected to last more than 30 consecutive calendar days.

## Comparability With Employment Series

Month-to-month changes in total employment in manufacturing industries reflected by labor turnover rates are not comparable with the changes shown in the Bureau's employment series for the following reasons: (1) Accessions and separations are computed for the entire calendar month; the employment reports refer to the pay period which includes the 12th of the month; and (2) employees on strike are not counted as turnover actions although such employees are excluded from the employment estimates if the work stoppage extends through the report period.

## ESTIMA TING METHODS

The principal features of the procedure used to estimate employment for the industry statistics are (1) the use of the "link relative" technique, which is a form of
ratio estimation, and (2) periodic adjustment of employment levels to new benchmarks, and (3) the use of size and regional stratification.

## The 'Link Relative" Technique

From a sample composed of establishments reporting for both the previous and current months, the ratio of current month employment to that of the previous month is computed. This is called a link relative. The estimates of employment (all employees, including production and nonproduction workers together) for the current month are obtained by multiplying the estimates for the previous month by these "link relatives." Other features of the general procedures are described later in the table, Summary of Methods for Computing Industry Statistics on Employment, Hours, Earnings, and Labor Turnover. Further details are given in the technical notes on Measurement of Employment, Hours, and Earnings in Nonagricultural Industries and on Measuremnt of Labor Tumover, which are available upon request.

## Size and Regional Stratification

A number of industries are stratified by size of establishment and or by region, and the stratified produc-tion- or nonsupervisory-worker data are used to weight the hours and earnings into broader industry groupings. Accordingly, the basic estimating cell for an employment, hours, or earnings series, as the term is used in the summary of computational methods may be a whole industry or a size stratum, a region stratum, or a size stratum of a region within an industry.

## Benchmark Adjustments

Employment estimates are periodically compared with comprehensive counts of employment which provide "benchmarks" for the various nonagricultural industries, and appropriate adjustments are made as indicated. The industry estimates are currently projected from March 1965 levels. Normally, benchmark adjustments are made annually.

The primary source of benchmark information is the employment data, by industry, compiled quarterly by State agencies from reports of establishments covered under State unemployment insurance laws. These tabulations, covering three-fourths of the total nonfarm employment in the United States, are prepared under the direction of the Bureau of Employment Security. Benchmark data for the residual are obtained from the records of the Social Security Administration, the Interstate Commerce Commission, and a number of other agencies in private industry or government.

The estimates relating to the benchmark month are compared with new benchmark levels, industry by industry. If revisions are necessary, the monthly series of estimates are adjusted between the new benchmark and the preceding one, and the new benchmark for each industry is then carried forward progressively to the current month by use of the sample trends. Thus, under
this procedure, the benchmark is used to establish the level of employment, while the sample is used to measure the month-to-month changes in the level.

Data for all months since the last benchmark to which the series has been adjusted are therefore subject to revision. To provide users of the data with a convenient reference source for the revised data, the BLS publishes as soon as possible after each benchmark revision a summary volume of employment, hours, earnings, and labor turnover statistics.

## THE SAMPLE

## Design

The sampling plan used in the current employment statistics program is an optimum allocation design known as "sampling proportionate to average size of establishment." The universe of establishments is stratified first by industry and then within each industry by size of establishment in terms of employment. For eachindustry the total size of sample is distributed among the size class cells on the basis of average employment per establishment in each cell. In practice, this is equivalent to distributing the predetermined total number of establishments required in the sample among the cells on the basis of the ratio of employment in each cell to total employment in the industry. Within each stratum the sample members are selected at random.

Under this type of design, large establishments fall into the sample with certainty. The size of the samples for the various industries is determined empirically on the basis of experience and of cost considerations. In a manufacturing industry in which a high proportion of total employment is concentrated in a relatively few establishments, a large percentage of total employment is included in the sample. Consequently, the sample design for such industries provides for a complete census of the larger establishments with only a few chosen from among the smaller establishments or none at all if the concentration of employment is great enough. On the other hand, in an industry in which a large proportion of total employment is in small establishments, the sample design calls for inclusion of all large establishments, and also for a substantial number of the smaller ones. Many industries in the trade and service divisions fall into this category. In order to keep the sample to a size which can be handled by available resources, it is necessary to accept samples in these divisions with a smaller proportion of universe employment than is the case for most manufacturing industries. Since individual establishments in these nonmanufacturing divisions generally show less fluctuation from regular cyclical or seasonal patterns than establishments in manufacturing industries, these smaller samples (in terms of employment) generally produce reliable estimates.

In the context of the BLS employment and labor turnover statistics programs, with theiremphasis on pro-
ducing timely data at minimum cost, a sample must be obtained which will provide coverage of a sufficiently large segment of the universe to provide reasonably reliable estimates that can be published promptly and regularly. The present sample meets these specifications for most industries. With its use, the BLS is able to produce preliminary estimates each month for many industries and for many geographic levels within a few weeks after reports are mailed by respondents, and at a somewhat later date, statistics in considerably greater industrial detail. The tendency of such a sample to produce biased estimates of the level of earnings for certain industries is counteracted by the stratified estimating procedure described under "Estimating Methods."

## Coverage

The BLS sample of establishment employment and payrolls is the largest monthly sampling operation in the field of social statistics. The table that follows shows the approximate proportion of total employment in each industry division covered by the group of establishments furnishing monthly employment data. The coverage for individual industries within the division may vary from the proportions shown.

Approximate size and coverage of BLS employment and payrolls sample, March $1965^{1}$

| Industry division | Employees |  |
| :---: | :---: | :---: |
|  | Number reported | Percent of total |
| Mining | 287,000 | 46 |
| Contract construction | 620,000 | 22 |
| Manufacturing . . . . . . . . . . . . | 11,338,000 | 64 |
| Transportation and public utilities: |  |  |
| Railroad transportation (ICC) | 697,000 | 96 |
| Other transportation and public utilities. . . . . . . . . . | 1,740,000 | 54 |
| Wholesale and retail trade. | 2,403,000 | 20 |
| Finance, insurance and real estate. . . . . . . . . . . . . . . . . | 1,030,100 | 35 |
| Service and miscellaneous | 1,682,000 | 19 |
| Government: |  |  |
| Federal (Civil Service Commission) ${ }^{2}$. . . . . | 2,326,000 | 100 |
| State and local | 3,980,000 | 52 |

${ }^{1}$ Since a few establishments do not report payroll and man-hour information, hours and earnings estimates may be based on a slightly smaller sample than employment estimates.
${ }^{2}$ State and area estimates of Federal employment are based on reports from a sample of Federal establishments, collected through the BLS-State cooperative program.

The table below shows the approximate coverage, in terms of employment, of the labor turnover sample.

Approximate size and coverage of BLS labor turnover sample, March 1965

| Industry | Employees |  |
| :---: | :---: | :---: |
|  | Number reported | Percent of total |
| Manufacturing | 10,809,200 | 61 |
| Metal mining | 65,800 | 80 |
| Coal mining. | 61,600 | 43 |
| Communication: |  |  |
| Telephone | 579,200 | 80 |
| Telegraph | 21,600 | 68 |

## Reliability of the Employment Estimates

The estimates derived from the establishment suryey may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures. The relatively large size of the BLS establishment sample assures a very high degree of accuracy. Therefore, sampling variability as expressed in standard errors of the estimate is of little consequence, particularly with respect to month-to-month changes. However, since the use of the link relative technique requires the use of the previous month's estimate as the base in computing the current month's estimate, small sampling and response errors may cumulate over several months. To remove this accumulated error, the estimates are adjusted to new benchmarks annually. In addition to the sampling and response errors, the benchmark revision adjusts the estimates for changes in the industrial classification of individual establishments (resulting from changes in their product which are not reflected in the levels of estimates until the data are adjusted to new benchmarks.) In fact, at the more detailed industry levels, particularly within manufacturing, changes in classification are the major cause of benchmark adjustments. Another cause of differences, generally minor, arises from improvements in the quality of the benchmark data. (A detailed description of the March 1965 benchmark is available from the Bureau upon request.)

The entire difference between the estimate and benchmarks is assumed to have accumulated at a regular rate. Accordingly, the all employee series, for months between the current and the last preceding benchmark, are adjusted by tapering out the difference back from the current benchmark to the last previous benchmark. The series for months subsequent to the benchmark month are revised by projecting the level of the new benchmark by the trend of the unadjusted series.

For the most recent months, national, State, and area estimates are preliminary and are so foomoted in the tables. These figures are based on less than the total sample and are revised when all the reports in the sample design have been received.

An approximation of the standard deviations (based on the experience of the last several years) of revisions between (1) final estimates and benchmarks, and (2) pre~ liminary and final estimates, are presented in the following table. The chances are about 2 out of 3 that the revisions will be less than the amount indicated for each size of estimate. The chances are about 19 out of 20 that the revisions will be less than twice the amount indicated.

Average standard deviation of revisions between final estimates and benchmarks and between preliminary and final estimates

| Size of empl. <br> estimate | Standard deviations of revisions |  |
| :---: | :---: | :---: |
|  | Final $^{1}$ | Preliminary |
| $50,000 \ldots \ldots . .$. | 2,000 | 600 |
| $100,000 \ldots . .$. | 2,500 | 900 |
| $200,000 \ldots . .$. | 4,000 | 1,300 |
| $500,000 \ldots . . .$. | 7,500 | 2,400 |
| $1,000,000 \ldots$ | 12,000 | 4,100 |

1 Assuming 12 -month intervals between benchmark revisions.

A comparison of the actual amounts of revisions made in the last 3 benchmark years follows:

Nonagricultural payroll employment estimates, by industry division, as a percentage of the benchmark for 1963-65

| Industry division | 1963 | 1964 | 1965 |
| :---: | ---: | ---: | ---: |
| Total . . . . . . . . . . . . . . . . . . . | 101.0 | 100.0 | 99.5 |
| Mining . . . . . . . . . . . . | 100.3 | 100.0 | 99.5 |
| Contract construction . . . . . . . | 101.5 | 101.5 | 100.9 |
| Manufacturing . . . . . . . . . . . | 100.1 | 100.2 | 99.8 |
| Transportation and public |  |  |  |
| utilities . . . . . . . . . . . . . . | 100.0 | 100.4 | 100.1 |
| Wholesale and retail trade . . . . | 100.6 | 100.4 | 99.4 |

## STATISTICS FOR STATES AND AREAS

State and area employment, hours; earnings, and labor turnover data are collected and prepared by State agencies in cooperation with BLS. The area statistics relate to metropolitan areas. Definitions for all areas are published each year in the issue of Employment and Earnings and Monthly Report on the Labor Force that contains State and area annual averages. Changes in definitions are noted as they occur. Additional industry detail may be obtained from the State agencies listed on the inside back cover of each issue. These statistics are based on the same establishment reports used by

BLS for preparing national estimates. For employment, the sum of the State figures may differ slightly from the equivalent official U.S. totals on a national basis, because some States have more recent benchmarks than others and because of the effects of differing industrial and geographic stratification.

For the States and the areas shown in the B and C sections of this periodical, all the annual average data for the detailed industry statistics currently published by each cooperating State agency are presented (from the earliest data of availability of each series) in a summary volume published annually by the Bureau of Labor Statistics.

## UNEMPLOYMENT INSURANCE DATA

Insured unemployment represents the number of persons reporting a week of unemployment under an unemployment insurance program. It includes some persons who are working part time who would be counted as employed in the payroll and household surveys. Excluded are persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (agriculture, State and local government, domestic service, self-employment, unpaid family work, nonprofit organizations, and firms below a minimum size). The rate of insured unemployment is the number of insured unemployed expressed as a percent of average covered employment in a 12 -month period ending 6 to 8 months prior to the week of reference. Initial
claims are notices filed by those losing jobs covered by an unemployment insurance program that they are starting a period of unemployment. A claimant who continues to be unemployed a full week is then counted in the insured, unemployment figure.

Because of differences in State laws and procedures under which unemployment insurance programs are operated, State unemployment rates generally indicate, but do not precisely measure, differences among the individual States. Persons wishing to receive a detailed description of the nature, sources, inclusions and exclusions, and limitations of unemployment insurance data should address their inquiries to Bureau of Employment Security, Washington, D.C.

## SEASONAL ADJUSTMENT

Many economic statistics reflect a regularly recurring seasonal movement which can be estimated on the basis of past experience. By eliminating that part of the change which can be ascribed to usual seasonal variation, it is possible to observe the cyclical and other nonseasonal movements in the series. However, in evaluating deviations from the seasonal pattern--that is, changes in a seasonally adjusted series--it is important to note that seasonal adjustment is merely an approximation based on past experience. Seasonally adjusted estimates have a broader margin of possible error than the original data on which they are based, since they are subject not only to sampling and other errors but, in addition, are affected by the uncertainties of the seasonal adjustment process itself. Seasonally adjusted series for selected labor force and establishment data are published regularly in Employment and Earnings and Monthly Report on the Labor Force.

The seasonal adjustment method used for these series is an adaptation of the standard ratio-to-moving average method, with a provision for "moving" adjustment factors to take account of changing seasonal patterns. A detailed description of the method is given in the booklet, The $B L S$ Seasonal Factor Method (1966), which may be obtained from the Bureau on request. An earlier version of the method is described in Appendix G of the 1962 Report of the President's Committee to Appraise Employment and Unemployment Státistics, Measuring Employment and Unemployment.

For establishment data, the seasonally adjusted series on weekly hours and labor turnover rates for industry groupings are computed by applying factors
directly to the corresponding unadjusted series, but seasonally adjusted employment totals for all employees and production workers by industry divisions are obtained by summing the seasonally adjusted data which are published for component industries. Indexes of aggregate weekly man-hours seasonally adjusted, for mining, contract construction, and the major industries in manufacturing are obtained by multiplying average weekly hours, seasonally adjusted, by production workers, seasonally adjusted and dividing by the $1957-59$ base. For total, manufacturing, and durable and nondurable goods, the indexes of aggregate weekly man-hours, seasonally adjusted, are obtained by summing the aggregate weekly man-hours, seasonally adjusted, for the appropriate component industries and dividing by the 1957-59 base.

The seasonally adjusted establishment data for Federal Government are based on a series which excludes the Christmas temporary help employed by the Post Office Department in December. The employment of these workers constitutes the only significant seasonal change in Federal Government employment during the winter months. Furthermore, the volume of such employment may change substantially from year to year because of administrative decisions by the Post Office Department. Hence, it was considered desirable to exclude this group from the data upon which the seasonally adjusted series is based. Factors currently in use for the establishment data are shown in the September 1966 Employment and Earnings and Monthly Report on the Labor Force, and revisions will be made coincidental with the adjustment of series to new benchmark levels.

For each of the three major labor force components-agricultural and nonagricultural employment, and unem-ployment--data for four age-sex groups (male and female workers under age 20 , and age 20 and over) are separately adjusted for seasonal variation and are then added to give seasonally adjusted total figures. In order to produce seasonally adjusted total employment and civilian labor force data, the appropriate series are aggregated. The seasonally adjusted rate of unemployment is derived by dividing the seasonally adjusted figure for total unemployment (the sum of four seasonally adjusted age-sex components) by the figure for the
seasonally adjusted civilian labor force (the sum of twelve seasonally adjusted age-sex components).

The seasonal adjustment factors applying to current data are based on a pattern shown by past experience. These factors are revised in. the light of the pattern revealed by subsequent data. Revised seasonally adjusted series for major components of the labor force based on data through December 1966 are published in the February 1967 Employment and Eamings and Monthly Report on the Labor Force. Revisions will be made annually as each additional year's data become available.
on Employment, Hours, Earnings, and Lahor Turnover

| Item | Basic estimating cells (industry, region, size, or region/size cell) | Aggregate industry levels (divisions, groups and, where stratified, individual cells) |
| :---: | :---: | :---: |
|  | Monthly Data |  |
| All employees | All-employee estimate for previous month multiplied by ratio of all employees in current monch to all employees in previous month, for sample establishments which reported for both months. | Sum of all-employee estimates for component cells. |
| Production or nonsupervisory workers; women employees. | All-employee estimate for current month multi plied by (1) ratio of production or nonsupervisory workers to all employees in sample establishments for current month, (2) ratio of women to all employees. | Sum of production- or nonsupervisory-worker estimates, or estimates of women employees, for component cells. |
| Gross average weekly hours . | Production- or nonsupervisory-worker man-hours divided by number of production or nonsupervisory workers. | Average, weighted by production- or nonsuper-visory-worker employment, of the average weekly hours for component cells. |
| Average weekly overtime hours | Production-worker overtime man-hours divided by number of producrion workers. | Average, weighted by production-worker employmenc, of the average weekly overtime hours for component cells. |
| Gross a verage hourly earnings . . | Total production- or nonsupervisory-worker payroll divided by total production- or nonsuper-visory-worker man-hours. | Average, weighted by aggregate man-hours, of the average hourly earnings for component cells. |
| Gross average weekly earnings . . | Product of gross average weekly hours and average hourly earnings. | Product of gross average weekly hours and average hourly earnings. |
| Labor turnover rates (cotal, men, and women). | The number of particular actions (e.g., quits) in reporting firms divided by total employment in those firms. The result is multiplied by 100. For men (or women), the number of men (women) who quit is divided by the total number of men (women) employed. | Average, weighted by employment, of the rates for component cells. |
|  | Annual Average Data |  |
| All employees and production or nonsupervisory workers. | Sum of monthly estimates divided by 12. | Sum of monthly estimates divided by 12. |
| Gross average weekly hours | Annual total of aggregate man-hours (productionor nonsupervisory-worker employment multiplied by average weekly hours) divided by annual sum of employment. | Annual total of aggregate man-hours for production or nonsupervisory workers divided by annual sum of employment for these workers. |
| Average weekly overtime hours | Annual total of aggregate overtime man-hours (production-worker emp'oymenc multiplied by average weekly overtime hours) divided by annual sum of employment. | Annual total of aggregate overtime man-hours for production workers divided by annual sum of employment for these workers. |
| Gross average hourly earnings . | Annual total of aggregate payrolls (productionor nonsupervisory-worker employment multiplied by weekly earnings) divided by annual aggregate man-hours. | Annual total of aggregate payrolls divided by annual aggregate man-hours. |
| Gross average weekly earnings . . | Product of gross average weekly hours and a verage hourly earnings. | Product of gross average weekly hours and average hourly earnings. |
| Labor turnover rates. | Sum of monthly rates divided by 12. | Sum of monthly rates divided by 12. |
