## Employment and Unemployment Developments, August 1969

Employment rose modestly in August, while the unemployment situation remained about the same. Nonfarm payroll employment rose by 165,000 (seasonally adjusted) over the month, but two-thirds of the gain was due to the return of workers after an early model-changeover in the automobile industry. The total unemployment rate, at 3.5 percent, was essentially unchanged from July. Jobless rates remained the same for most major groups in the labor force.

## Industry Employment

Following a seasonally adjusted decline of 30,000 in July (as revised), nonfarm payroll employment in August continued to show signs of leveling off. Although up by 165,000 over the month to 70.4 million (seasonally adjusted), about 100,000 of the increase was attributable to the return of auto workers following an earlier-than-usual model changeover.

Since March, growth in nonfarm payroll employment has slowed down substantially. Monthly payroll employment increases have averaged 145,000 in the March-August period, in contrast with a 250,000 average pickup in the SeptemberMarch period. Most major industries have experienced employment slowdowns during the past 5 months.

Over the month, seasonally adjusted gains were reported in manufacturing, services, trade, finance, and State and local government. With the exception of the transportation equipment industry, most manufacturing industries showed little or no change in August. The only sizable gains were in primary metals $(15,000)$ and electrical equipment (10,000). Employment fell by 10,000 in apparel.

Employment in contract construction was down by about 45,000 (seasonally adjusted), its second consecutive monthly decline. About 25,000 of the August drop, however, reflected increased strike activity. Since June, the con-
struction unemployment rate has risen from 5.0 to 7.4 percent. Both of these developments primarily reflect significant declines in housing starts. Since last August, construction employment has increased by 105,000 .

In services, the 55,000 August gain (seasonally adjusted) followed a 4-month period when the average monthly increase was only 5,000 , compared with a 65,000 monthly increase for the September 1968-March 1969 period. The increase in trade, though sizable ( 30,000 ), still remained below the average monthly gains recorded during most of 1969. State and local government employment rose 20,000 in August. In contrast, Federal government employment was down by 25,000 , the fifth month out of the past 6 that Federal employment has dropped.

## Hours and Earnings

After 5 consecutive months at 37.8 hours (seasonally adjusted), average weekly hours for rank-and-file workers on private nonagricultural payrolls edged up to 37.9 hours. Increases in the August workweek in construction, trade, and finance offset declines in manufacturing and mining.

The average workweek in manufacturing was down 0.1 hour over the month to 40.6 hours (seasonally adjusted) in August. The factory workweek has edged slowly downward since March, when it stood at 40.9 hours. The gradual reduction in the manufacturing workweek has been widespread among both durable and nondurable goods industries, with many down substantially from their 1969 highs. Overtime hours in manufacturing, at 3.6 hours seasonally adjusted, remained unchanged for the third consecutive month.

Average hourly earnings for rank-and-file workers were unchanged in August at $\$ 3.04$. Due to a longer workweek, average weekly earnings increased by 61 cents to $\$ 116.43$.

Since last August, average hourly earnings have risen by 19 cents and weekly earnings by $\$ 7.27$ (both increasing by 6.7 percent).

## Unemployment

The number of unemployed persons totaled 2.9 million in August, 325,000 fewer than in July. The decline was in line with the usual July-to-August pattern, as teenagers began their annual exodus from the summertime labor force. After seasonal adjustment, unemployment remained the same over the month for most major worker groups. However, unemployment was up by about 275,000 since the 12-year low reached early last winter.

The overall unemployment rate in August was 3.5 percent, about the same as the 3.6 percent in July. Although the August rate remained within the 3.4-3.6 percent range of the past 6 months, it was up slightly from the post-Korean low of 3.3 percent recorded in the DecemberFebruary period.

Jobless rates for adult men (2.1 percent), married men ( 1.5 percent), women ( 3.8 percent), and teenagers ( 12.5 percent) were virtually unchanged in August. The rate for adult men, however, has risen somewhat from its alltime recorded low of 1.8 percent in December. Rates for most other groups remained near the lows reached earlier this year.

The jobless rate for all full-time workers remained at 3.1 percent for the fourth straight month but was up from the 2.8 percent reached in December-the low point for this series, which began in 1963. The rate for part-time workers, at 6.8 percent, was essentially unchanged from July and from a year ago. (This issue introduces a new table, A-30, presenting seasonally adjusted data on full- and part-time workers by sex and age.)

The unemployment rate for workers covered under State unemployment insurance programs
edged down to 2.1 percent in August. This rate has remained in the narrow range of 2.0-2.2 percent for the past 12 months.

Jobless rates for both white and Negro workers were unchanged in August; however, both have risen somewhat since reaching post-Korean record lows in February. The white unemployment rate in August was 3.2 percent, up from 2.9 percent in February, while the rate for Negroes was 6.5 percent in August, compared with 5.7 percent in February.

The increase in unemployment since the end of last year was mainly of short-term duration. Unemployment of less than 5 weeks, at 1.6 million in August (seasonally adjusted), was up by 275,000 from the level at the end of last year. Long-term unemployment ( 15 weeks or more) has risen only slightly during the year.

## Labor Force and Employment

The civilian labor force declined less in August than it usually does at this time of year. After seasonal adjustment, the labor force stood at 81.1 million, 300,000 above July. All of the rise occurred among adult workers.

Total employment was 78.2 million (seasonally adjusted) in August; this represented a gain of 325,000 from July, all among adult workers. After showing little or no change from February to June, employment has advanced somewhat in the past 2 months. Despite this increase, the August level was up only 450,000 from February.

The number of persons who want full-time nonagricultural jobs but are employed part time for economic reasons rose by 200,000 in August to 2.0 million (seasonally adjusted), the highest level since early 1967. Economic parttime employment has increased 400,000 since the beginning of the year; persons who usually work full time accounted for two-thirds of the rise.

This issue of Employment and Earnings introduces new seasonally adjusted series from the Current Population Survey (CPS) on the fulland part-time labor force. Although such data have been published on a regular monthly basis (table A-7) since February 1966, only the series for all full- and part-time workers had been adjusted previously for seasonality. Beginning with the current issue, a table (A-30) is being included on a regular monthly basis which presents the seasonally adjusted civilian labor force, employment, unemployment, and unemployment rate for the total, adult male, and adult female full-time groups and for the total parttime group. The new data replace the series previously published and may differ somewhat from earlier estimates.

Beginning with the October issue and appearing subsequently in quarterly months, an additional table will be included which presents quarterly average employment status data for the three major age-sex groups-adult males, adult females, and teenagers. Tables 1 through 8 on pages 6-13 provide the historical data for the new quarterly series. Seasonally adjusted quarterly data are shown for both the full- and part-time labor force-total, adult men, adult women, and teenagers-from 1963 (when the series began) through the second quarter of 1969. Annual averages for 1963-68 also are included in the tables. Because of some characteristics discussed below, these numbers should be used cautiously, and small changes in the series should be ignored.

## Seasonal Adjustment Procedure

In developing seasonal adjustment factors for the new series, the usual Bureau of Labor Statistics procedures, which require 8 years of data, were not used. The full- and part-time series consist of only 6 years of data; in addition, changes instituted in the CPS questionnaire in January 1967 I/ altered both the levels and the seasonal patterns for components of these series.

For the teenagers, in particular, this change caused a real break in the part-time and fulltime unemployment series between 1966 and 1967. Therefore, the periods 1963-66 and 196768 were adjusted separately.

For most components of the series, the data were seasonally adjusted directly. In three instances, however, the seasonally adjusted data were obtained as residuals after calculation of the seasonally adjusted part-time component. The latter procedure was used in those cases where part-time workers made up a small portion of total employment and unemployment. Where both the full- and part-time data were seasonally adjusted directly, the sum of these two may differ somewhat from the seasonally adjusted totals published for the totals and major age-sex groups. The method for each group is summarized below.

| Category | Part time | Full time |
| :---: | :---: | :---: |
| Adult men: |  |  |
| Employed ----- | Direct seasonal adjustment. | Total seasonally adjusted level minus the seasonally adjusted part-time component. |
| Unemployed_- | Direct. | Same as above. |
| Adult women: |  |  |
| Employed .-..- | Direct. | Same as above. |
| Unemployed_-- | Direct. | Direct. |
| 16-19 year-olds: |  |  |
| Employed ----- | Direct. | Direct. |
| Unemployed_- | Direct. | Direct. |

## Standard Errors

Since the full- and part-time estimates are based on a sample, they may differ from the figures that would have been obtained if a complete census using the same schedules and

1/ See "New Definitions for Employment and Unemployment," Employment and Earnings and Monthly Report on the Labor Force, February 1967 , Vol. 13, No. 8, pp. 3-27.
procedures had been possible. The standard error is a measure of sampling variability, that is, the variation that might occur by chance because only a sample of the population is surveyed. Because several of the full- and parttime series are based on small sample counts, they may lend themselves somewhat readily to
misinterpretation. The standard errors at the 1 sigma level of significance for the seasonally adjusted unemployment rates, based on current levels of employment and unemployment, are given below. For analytical purposes, a greater degree of reliability, such as 1.6 or 2.0 standard errors, should be used.

A-35: Employed persons by age and sex, seasonally adiusted

A-36: Employed persons by major occupation group, seasonally adjusted

B-1: Employees on nonagricultural payrolls, by industry division
1919 to date

NOTE: Data include Alaska and Hawaii beginning 1959. This inclusion has resulted in an increase of 212;000 ( 0.4 percent) in the nonagricultural total for the March 1959 benchmark month.
Data for the 2 most recent months are preliminary.

B-2: Employees on nonagricultural payrolls, by industry

${ }^{1}$ Data relate to production workers in mining and manufacturing: to construction workers in contract construction: and to nonsupervisory workers in wholesale and retail trade; finance, insurance, and real estate; transportation and public utilities; and services. Transportation and public utilities, and services are included in Total Privare but are not shown separately in insurance,
this table.
${ }^{2}$ Beginning January 1965, data relate to railroads with operating revenues of $\$ 5,000,000$ or more.
${ }^{3}$ Data for nonsupervisory workers exclude messengers.
${ }^{4}$ Data for nonoffice salesmen excluded from nonsupervisory count for all series in this division.
${ }^{〔}$ Prepared by the U.S. Civil Service Commission. Data relate to civilian employment only and exclude Central intelligence and National Security Agencies. Beginning january 1969 , federal employment includes approximately 39,000 civilian technicians of the Nariona! Guard who were transferred from State to federal status in accordance with Public Law $90-486$.
"Not available.

${ }_{2}^{1}$ Combined with services.
${ }^{2}$ Combined with construction.
${ }^{3}$ Federal employment in the Maryland and Virginia sectors of the Washington Standard Metropolitan Statistical Area
is included in data for the District of Columbia.
See Virginia.
Area included in Chicago-Northwestern Indiana Standard Consolidated Area.
Revised series; not strictly comparable with previously published data.
Subarea of Philadelphia, Pennsylvania Standard Metropolitan Statistical Area.
Area included in New York-Northeastern New Jersey Standard Consolidated Area.
${ }_{10}$ Subarea of Rochester Standard Metropolitan Statistical Area.
10 Subarea of New York Standard Metropolitan Statistical Area.
11 Total includes data for industry divisions not shown separately. Services excludes agriculture, forestry, and fisheries.
12 Subarea of Washington Standard Metropolitan Statistical Area.

* Not available.

NOTE: Data for the current month are preliminary.
NOTE: Data for the current month are preliminary.
SOUREE: Cooperating State agencies listed on inside back cover.

${ }^{1}$ For coverage of series, see footnote 1, table B-2.
${ }^{2}$ Beginning January 1965, data relate to railroads with operating revenues of $\$ 5,000,000$ or more. January 1969: $\$ 160.03$, $\$ 3.58$, and 44 . $7-$ February 1969 : $\$ 164,89$, $\$ 3,64$, and 45.3 . ${ }^{3}$ Data relate to employees in such occupations in the telephone industry as switchboard operators; service assistants; operating room instructors; and pay-station attendants. In 1966, such employees made up 33 percent of the total number of nonsupervisory employees in establishments reporting hours and earnings data.
${ }^{4}$ Data relate to employees in such occupations in the telephone industry as central office craftsmen; installation and exchange repair craftsmen; line, cable, and conduit craftsmen; and laborers. . In 1966, such employees made up 33 percent of the total number of nonsupervisory employees in establishments reporting hours and eamings data.
${ }^{5}$ Data relate to nonsupervisory employees except messengers.
${ }^{6}$ Money payments only; tips, not included.
${ }^{7}$ Data for nonoffice salesmen excluded from all series in this division.
*Nor available.
NOTE: Data for the 2 most recent months are preliminary.

C-3: Employment, hours, and indexes of earnings in the Executive Brarich of the Federal Government (Employment in thousands-includes both supervisory and nonsupervisory employees)

${ }^{1}$ Wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. Also includes an estimate of wages, salaries, and supplementary payments for the self-employed.
${ }^{2}$ Compensation per man-hour adjusted for changes in the consumer price index.
${ }^{3}$ Percent change based on aggregates.

- Average for 12 manths ending with quarter, divided by average for preceding 12 months.

Source: Output data from the Office of Business Economics, U.S. Department of Commerce. Man-hours and compensation of all persons from the Bureau of Labor Statistics. See BLS Handbook of Methods for Surveys and Studies --Chapter 22. Output Per Man-Hour Measures, Private Economy.

C-10: Gross hours and earnings of production workers on manufacturing payrolls, by State and selected areas

${ }^{1}$ Beginning with January 1959, transfers berween establishments of the same firm are included in total accessions and total separations, therefore rates for these items are not strictly comparable with prior data. Transfers comprise part of other accessions and other separations, the rates for which are not shown separately.

NOTE: Data include Alaska and Hawaii beginning 1999. This inclusion has not significantly affected the labor curnover series.
Data for the current month are preliminary.

D-2: Labor turnover rates, by industry

${ }^{1}$ Beginning with January 1959, transfers between establishments of the same fitm are included in total accessions and total separations, therefore rates for these items are not strictly comparable with prior data. Transfers comprise part of other accessions and other separations, the rates for which are not shown separately,

NOTE: Data include Alaska and Hawaii beginning 1959. This inclusion has not significantly affected the labor curnovet series.
Data for the current month are preliminary.

D-4: Labor turnover rates in manufacturing for selected States and areas

[^19]E-1: Insured unemployment under State programs

${ }^{1}$ Based on unrounded data; changes of less than 50 not shown.
${ }^{2}$ Include data under the program for Puerto Rico's sugarcane workers. Rates exclude the sugarcane workers as' comparable covered employment data are not yet avallable.
*Excludes insured unemployment under extended duration provisions of regular State laws.
E.2: Insured unemployment ${ }^{1}$ in 150 major labor areas ${ }^{2}$.

${ }^{1}$ Insured jobless under State, Federal Enployee, and Ex-Servicemen's unemployment insurance proframs.
${ }^{2}$ For full name of labor area, see Area Trends in Employment and Unemployment published by the Bureau of Employment Security.
*Excludes insured unemployed under extended duration provisions of regular State laws.
**Revised.

## Technical Note

#### Abstract

Additional information concerning the preparation of the labor force, employment, hours and earnings, and labor turnover series--concepts and scope, survey methods, and limitations-is contained in technical notes for each of these series, available from the Bureau of Labor Statistics free of charge.

## INTRODUCTION

The statistics in this periodical are compiled from three major sources: (1) household interviews, (2) payroll reports from employers, and (3) administrative statistics of unemployment insurance systems.

Data based on household interviews areobtained from a sample survey of the population 16 years of age and over. The survey is conducted each month by the Bureau of the Census for the Bureau of Labor Statistics and provides comprehensive data on the labor force, the employed and the unemployed, including such characteristics as age, sex, color, marital status, occupations, hours of work, and duration of unemployment. The survey also provides data on the characteristics and past work experience of those not in the labor force. The information is collected by trained interviewers from a sample of about 50,000 households, representing 449 areas in 863 counties and independent cities, with coverage in 50 States and the District of Columbia. The data collected are based on the activity or status reported for the calendar week including the 12th of the month.

Data basedon establishmentpayroll records are compiled each month from mail questionnaires by the Bureau of Labor Statistics, in cooperation with State agencies. The payroll survey provides detailed industry information on nonagricultural wage and salary employment, average weekly hours, average hourly and weekly earnings, and labor turnover for the Nation, States, and metropolitan areas. The figures are based on payroll reports from a sample of establishments employing about 25 million nonagriculture wage and salary workers. The data relate to all workers, full- or part-time, who received pay during the payroll period which includes the 12th of the month.

Data based on administrative records of unemployment insurance systems furnish a complete count of insured unemployment among the two-thirds of the Nation's labor force covered by unemployment insurance programs. Weekly reports, by State, are issued on the number of initial claims, the volume and rate of insured unemployment under State unemployment insurance programs, and the volume under programs of unemployment compensation for Federal employees, ex-servicemen, and railroad workers. These statistics are published by the Manpower Administration, U.S. Department of Labor, in "Unemployment Insurance Claims."

## Relation between the household and payroll series

The household and payroll data supplement one another, each providing significant types of information that the other cannot suitably supply. Population characteristics, for example, are readily obtained only from the household survey whereas detailed industrial classifications can be reliably derived only from establishment reports.

Data from these two sources differ from each other because of differences in definition and coverage, sources of information, methods of collection, and estimating procedures. Sampling variability and response errors are additional reasons for discrepancies. The major factors which have a differential effect on levels and trends of the two series are as follows:

## Employment

Coverage. The household survey definition of employment comprises wage and salary workers (including domestics and other private household workers), selfemployed persons, and unpaid workers who worked 15 hours or more during the survey week in family-operated enterprises. Employment in both agricultural and nonagricultural industries is included. The payroll survey covers only wage and salary employees on the payrolls of nonagricultural establishments.

Multiple jobholding. The household approach provides information on the work status of the population without duplication since each person is classified as employed, unemployed, or not in the labor force. Employed persons holding more than one job are counted only once and are classified according to the job at which they worked the greatest number of hours during the survey week. In the figures based on establishment records, persons who worked in more than one establishment during the reporting period are counted each time their names appear on payrolls.

Unpaid absences from jobs. The household survey includes among the employed all persons who had jobs but were not at work during the survey week--that is, were not working but had jobs from which they were temporarily absent because of illness, bad weather, vacation, labor-management dispute, or because they were taxing time off for various other reasons, even if they were not paid by their employers for the time off. In
the figures based on payroll reports, persons on leave paid for by the company are included, but not those on leave without pay for the entire payroll period.

## Hours of Work

The household survey measures hours actually worked whereas the payroll survey measures hours paid for by employers. In the household survey data, all persons with a job but not at work are excluded from the hours distributions and the computations of average hours. In the payroll survey, employees on paid vacation, paid holiday, or paid sick leave are included and assigned the number of hours for which they were paid during the reporting period.

## Comparability of the household in terview data with other series

Unemployment insurance data. The unemployed total from the household survey includes all persons who did not have a job at all during the survey week and were looking for work or were waiting to be called back to a job from which they had been laid off, regardless of whether or not they were eligible for unemployment insurance. Figures on unemployment insurance claims, prepared by the Manpower Administration of the Department of Labor, exclude persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (agriculture, State and local government, domestic service, self employment, unpaid family work, nonprofitorganizations, and firms below a minimum size).

In addition, the qualifications for drawing unemployment compensation differ from the definition of unemployment used in the household survey. For example, persons with a job but not at work and persons working only a few hours during the week are sometimes eligible for unemployment compensation but are classified as employed rather than unemployed in the household survey.

Agricultural employment estimates of the Department of Agriculture. The principal differences in coverage
are the inclusion of persons under 16 in the Statistical Research Service (SRS) series and the treatment of dual jobholders who are counted more than once if they worked on more than one farm during the reporting period. There are also wide differences in sampling techniques and collecting and estimating methods, which cannot be readily measured in terms of impact on differences in level and trend of the two series.

## Comparability of the payroll employment data with other series

Statistics on manufactures and business, Bureau of the Census. BLS establishment statistics on employment differ from employment counts derived by the Bureau of the Census from its censuses or annual sample surveys of manufacturing establishments and the censuses of business establishments. The major reasons for some noncomparability are different treatment of business units considered parts of an establishment, such as central administrative offices and auxiliary units, the industrial classification of establishments, and different reporting patterns by multiunit companies. There are also differences in the scope of the industries covered, e.g., the Census of Business excludes contract construction, professional services, public utilities, and financial establishments, whereas these are included in BLS statistics.

County Business Patterns. Data in County Business Patterns, published jointly by the U.S. Departments of Commerce and Health, Education, and Welfare, differ from BLS establishment statistics in the treatment of central administrative offices and auxiliary units. Differences may also arise because of industrial classification and reporting practices. In addition, CBP excludes interstate railroads and government, and coverage is incomplete for some of the nonprofit activities.

Employment covered by State unemployment insurance programs. Not all nonagricultural wage and salary workers are covered by the unemployment insurance programs. All workers in certain activities, such as interstate railroads, are excluded. In addition, small firms in covered industries are also excluded in 31 States. In general, these are establishments with less than four employees.

## Labor Force Data

## COLLECTION AND COVERAGE

Statistics on the employment status of the population, the personal, occupational, and other characteristics of the employed, the unemployed, and persons not in the labor force, and related data are compiled for the BLS by the Bureau of the Census in its Current Population Survey (CPS). A detailed description of this survey appears in "Concepts and Methods Used in Manpower Statistics from the Current Population Survey" (BLS Re-
port 313). This report is available from BLS on request.

These monthly surveys of the population are conducted with a scientifically selected sample designed to represent the civilian noninstitutional population 16 years and over. Respondents are interviewed to obtain information about the employment status of each member of the household 16 years of age and over. The inquiry relates to activity or status during the calendar week,

Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted in the following week.

Inmates of institutions and persons under 16 years of age are not covered in the regular monthly enumerations and are excluded from the population and labor force statistics shown in this report. Data on members of the Armed Forces, who are included as part of the categories "total noninstitutional population" and "total labor force," are obtained from the Department of Defense.

Each month, 50,000 occupied units are designated for interview. About 2,250 of these households are visited but interviews are not obtained because the occupants are not found at home after repeated calls or are unavailable for other reasons. This represents a noninterview rate for the survey of about 4.5 percent. In addition to the 50,000 occupied units, there are 8,500 sample units in an average month which are visited but found to be vacant or otherwise not to be enumerated. Part of the sample is changed each month. The rotation plan provides for three-fourths of the sample to be common from one month to the next, and one-half to be common with the same month a year ago.

## CONCEPTS

Employed persons comprise (a) all those who during the survey week did any work at all as paid employees, in their own business, profession, or farm, or who worked 15 hours or more as unpaid workers in an enterprise operated by a member of the family, and (b) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather. vacation, labor-management dispute, or personal reasons, whether or not they were paid by their employers for the time off, and whether or not they were seeking other jobs.

Each employed person is counted only once. Those who held more than one job are counted in the job at which they worked the greatest number of hours during the survey week.

Included in the total are employed citizens of foreign countries, temporarily in the United States, who are not living on the premises of an Embassy.

Excluded are persons whose only activity consisted of work around the house (such as own home housework, and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations.

Unemployed persons comprise all persons who did not work during the survey week, who made specific efforts to find a job within the past 4 weeks, and who were available for work during the survey week (except for temporary illness). Also included as unemployed are those who did not work at all, were available for work, and (a) were waiting to be called back to a job from which they had been laid off; or (b) were waiting to report to a new wage or salary job within 30 days.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of seeking work. Average duration is an arithmetic mean computed from a distribution by single weeks of unemployment.

Unemployed persons by reasons for unemployment are divided into four major groups. (1) Job losers are persons whose employment ended involuntarily who immediately began looking for work and persons on layoff. (2) Job leavers are persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work. (3) Reentrants are persons who previously worked at a full-time job lasting 2 weeks or longer but who were out of the labor force prior to beginning to look for work. (4) New entrants are persons who never worked at a full-time job lasting 2 weeks or longer.

The civilian labor force comprises the total of all civilians classified as employed or unemployed in accordance with the criteria described above. The "total labor force" also includes members of the Armed Forces stationed either in the United States or abroad.

The unemployment rate represents the number unemployed as a percent of the civilian labor force. This measure can also be computed for groups within the labor force classified by sex, age, marital status, color, etc. The job-loser, job-leaver, reentrant, and new entrant rates are each calculated as a percent of the civilian labor force; the sum of the rates for the four groups thus equals the total tunemployment rate.

Not in labor force includes all civilians 16 years and over who are not classified as employed or unemployed. These persons are further classified as "engaged in own home housework," "in school," "unable to work" because of long-term physical or mental illness, and "other." The "other" group includes for the most part retired persons, those reported as too old to work, the voluntarily idle, and seasonal workers for whom the survey week fell in an "off" season and who were not reported as unemployed. Persons doing only incidental unpaid family work (less than 15 hours) are also classified as not in the labor force.

For persons not in the labor force, data on previous work experience, intentions to seek work again, desire for a job at the time of interview, and reasons for not looking for work are compiled on a quarterly basis. The detailed questions for persons not in the labor force are asked only in those households that are new entrants to the sample and in those that are reentering the sample after 8 months' absence.

Occupation, industry, and class of worker for the employed apply to the job held in the survey week. Per-
sons with two or more jobs are classified in the job at which they worked the greatest number of hours during the survey week. The unemployed are classified according to their latest full-time civilian job lasting 2 weeks or more. The occupation and industry groups used in data derived from the CPS household interviews are defined as in the 1960 Census of Population. Information on the detailed categories included in these groups is available upon request.

The class-of-worker breakdown specifies "wage and salary workers," subdivided into private and government workers, "self-employed workers," and "unpaid family workers." Wage and salary workers receive wages, salary, commission, tips, or pay in kind from a private employer or from a governmental unit. Self-employed persons are those who work for profit or fees in their own business, profession, or trade, or operate a farm. Unpaid family workers are persons working without pay for 15 hours a week or more on a farm or in a business operated by a member of the household to whom they are related by blood or marriage.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, a person who normally works 40 hours a week but who was off on the Veterans. Day holiday would be reported as working 32 hours even though he was paid for the holiday.

For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the week. However, all the hours are credited to the major job.

Persons who worked 35 hours or more in the survey week are designated as working "full time"; persons who worked between 1 and 34 hours are designated as working "part time." Part-time workers are classified by their usual status at their present job (either full time or part time) and by their reason for working part time during the survey week (economic or other reasons). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. "Other reasons" include: Labor dispute, bad weather, own illness, vacation, demands of home housework, school, no desire for full-time work, and full-time worker only during peak season. Persons on full-time schedules include, in addition to those working 35 hours or more, those who worked from 1-34 hours for noneconomic reasons but usually work full time.

Full- and part-time labor force. The full-time labor force consists of persons working on full-time schedules, persons involuntarily working part time (because fulltime work is not available), and unemployed persons seeking full-time jobs. The part-time labor force consists of persons working part time voluntarily and unemployed persons seeking part-time work. Persons with a job but not at work during the survey week are classified ac-
cording to whether they usually work full or part time.

Labor force time lost is a measure of man-hours lost to the economy through unemployment and involuntary part-time employment and is expressed as a percent of potentially available man-hours. It is computed by assuming: (1) that unemployed persons looking for full-time work lost an average of 37.5 hours, (2) that those looking for parttime work lost the average number of hours actually worked by voluntary part-time workers during the survey week, and (3) that persons on part time for economic reasons lost the difference between 37.5 hours and the actual number of hours they worked.

## ESTIMATING METHODS

Under the estimation methods used in the CPS, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. There are no subsequent adjustments to independent benchmark data on labor force, employment, or unemployment. Therefore, revisions of the historical data are not an inherent feature of this statistical program.

1. Noninterview adjustment. The weights for all interviewed households are adjusted to the extent needed to account for occupied sample households for which no information was obtained because of absence, impassable roads, refusals, or unavailability for other reasons. This adjustment is made separately by groups of sample areas and, within these, for six groups--color (white and nonwhite) within the three residence categories (urban, rural nonfarm, and rural farm). The proportion of sample households not interviewed varies from 4 to 6 percent depending on weather, vacations, etc.
2. Ratio estimates. The distribution of the population selected for the sample may differ somewhat, by chance, from that of the Nation as a whole, in such characteristics as age, color, sex, and residence. Since these population characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio estimates as follows:
a. First-stage ratio estimate. This is a procedure in which the sample proportions are weighted by the known 1960 Census data on the color-residence distribution of the population. This step takes into account the differences existing at the time of the 1960 Census between the color-residence distribution for the Nation and for the sample areas.
b. Second-stage ratio estimate. In this step, the sample proportions are weighted by independent current estimates of the population by age, sex, and color. These estimates are prepared by carrying forward the most recent census data (1960) to take account of subsequent aging of the population, mortality, and migra-
tion between the United States and other countries.
3. Composite estimate procedure. In deriving statistics for a given month, a composite estimating procedure is used which takes account of net changes from the previous month for continuing parts of the sample (75 percent) as well as the sample results for the current month. This procedure reduces the sampling variability of month-to-month changes especially and of the levels for most items also.

## Rounding of Estimates

The sums of individual items may not always equal the totals shown in the same tables because of independent rounding of totals and components to the nearest thousand. Differences, however, are insignificant.

## Reliability of the Estimates

Since the estimates are based on a sample, they may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures.

The standard error is a measure of sampling variability, that is, the variations that might occur by chance because only a sample of the population is surveyed. The chances are about 2 out of 3 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 19 out of 20 that the difference would be less than twice the standard error.

Table A shows the average standard error for the major employment status categories, by sex, computed from data for past months. Estimates of change derived from the survey are also subject to sampling variability. The standard error of change for consecutive months is also shown in table A. The standard errors of level shown in table A are acceptable approximations of the standard errors of year-to-year change.

The figures presented in table $B$ are to be used for other characteristics and are approximations of the standard errors of all such characteristics. They should be interpreted as providing an indication of the order of magnitude of the standard errors rather than as the precise standard error for any specific item.

The standard error of the change in an item from one month to the next month is more closely related to the standard error of the monthly level for that item than to the size of the specific month-to-month change itself. Thus, in order to use the approximations to the standard errors of month-to-month changes as presented in table $C$, it is first necessary to obtain the standard error of the monthly level of the item in table B , and then find the standard error of the month-to-month change in table C corresponding to this standard error of level. It should

Table A. Average standard error of major employment status categories
(In thousands)

|  | $\begin{aligned} & \text { Total } \\ & \text { or } \\ & \text { white } \end{aligned}$ | Nonwhite | $\begin{aligned} & \text { Total } \\ & \text { or } \\ & \text { white } \end{aligned}$ | Nonwhite | Total or white | Nonwhite |
| 10. | 4 | 4 | 6 | 4 | 6 | 4 |
| 50 | 9 | 9 | 11 | 9 | 11 | 9 |
| 100 | 12 | 12 | 16 | 12 | 16 | 12 |
| 250 | 20 | 17 | 25 | 17 | 25 | 17 |
| 500 | 30 | 25 | 34 | 25 | 34 | 25 |
| 1,000 | 40 | 35 | 50 | 35 | 50 | 35 |
| 2,500 | 60 | 40 | 75 | 40 | 75 | 40 |
| 5,000 | 85 | 45 | 90 | . $\cdot$ | 90 | ... |
| 10,000 | 115 | $\ldots$ | 115 | $\cdots$ | 115 | ... |
| 20,000 . . . | 150 | ... | 125 | ... | 125 | ... |
| 30,000 | 170 | $\ldots$ | ... | $\ldots$ | . | $\ldots$ |
| 40,000 | 180 | ... | ... | ... | ... |  |

be noted that table $C$ applies to estimates of change between 2 consecutive months. For changes between the current month and the same month last year, the standard errors of level shown in table B are acceptable approximations.

Illustration: Assume that the tables showed the total number of persons working a specific number of hours as $15,000,000$, an increase of 500,000 over the previous month. Linear interpolation in the first column of table B shows that the standard error of $15,000,000$ is about 133,000. Consequently, the chances are about 68 out of 100 that the sample estimate differs by less than 133,000 from the figure which would have been obtained from a complete count of the number of persons working the given number of hours. Using the 133,000 as the standard error of the monthly level in table C, it may be seen that the standard error of the 500,000 increase is about 126,000.

Table C. Standard error of estimates of month-to-month change
(In thousands)

| Standard error of monthly level | Standard error of month-to-month change |

| 200............................ | 155 |
| 250 ............................ | 160 |
|  | 190 |

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Where the numerator is a subclass of the denominator, estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerator of the percentage, particularly if the percentage is large ( 50 percent or greater). Table D shows the standard errors for percentages derived from the survey. Linear interpolation may be used for percentages and base figures not shown in table D.

Table D. Standard error of percentage

| Base of percentages (thousands) | Estimated percentage |  |  |  |  |  |  |  |  |

## Establishment Data

## COLLECTION

Payroll reports provide current information on wage and salary employment, hours, earnings, and labor turnover in nonagricultural establishments, by industry and geographic location.

## Federal-State Cooperation

Under cooperative arrangements with State agencies, the respondent fills out a single employment or labor turnover reporting form, which is then used for national, State, and area estimates. This eliminates duplicate reporting on the part of respondents and, together with the use of identical techniques at the national and State levels, insures maximum comparability of estimates.

State agencies mail the forms to the establishments and examine the returns for consistency, accuracy, and completeness. The States use the information to prepare

State and area series and then send the establishment data to the BLS for use in preparing the national series.

## Shuttle Schedules

Two types of data collection schedules are used: Form BLS 790--Monthly Report on Employment, Payroll, and Hours; and Form DL 1219--Monthly Report on Job Openings and Labor Turnover. These schedules are of the "shuttle" type, with space for each month of the calendar year. The collecting agency returns the schedule to the respondent each month so that the next month's data can be entered. This procedure assures maximum comparability and accuracy of reporting, since the respondent can see the figures he has reported for previous months.

Form BLS 790 provides for entry of data on the number of full- and part-time workers on the payrolls of non-
agriculturral establishments and, for most industries, payroll and man-hours of production and related workers or nonsupervisory workers for the pay period which includes the 12th of the month. Form DL 1219 provides for the collection of information on the total number of accessions and separations, by type, during the calendar month, and was revised in January 1969 to provide for the collection of job openings data as well.

## CONCEPTS

Industrial Classification
Establishments reporting on Form BLS 790 and Form DL 1219 are classified into industries on the basis of their principal product or activity determined from information on annual sales volume. This information is collected each year on a supplement to the monthly 790 or 1219 report. For an establishment making more than one product or engaging in more than one activity, the entire employment of the establishment is included under the industry indicated by the most important product or activity.

All national, State, and area employment, hours, earnings, and labor turnover series are classified in accordance with the Standard Industrial Classification Manual, Bureau of the Budget, 1967.

## Industry Employment

Employment data, except those for the Federal Government, refer to persons on establishment payrolls who received pay for any part of the pay period which includes the 12th of the month. For Federal Government establishments, employment figures represent the number of persons who occupied positions on the last day of the calendar month. Intermittent workers are counted if they performed any service during the month.

The data exclude proprietors, the self-employed, unpaid volunteer, or family workers, farm workers, and domestic workers in households. Salaried officers of corporations are included. Government employment covers only civilian employees; military personnel are excluded.

Persons on establishment payrolls who are on paid sick leave (when pay is received directly from the firm), on paid holiday or paid vacation, or who work during a part of the pay period and are unemployed or on strike during the rest of the period, are counted as employed. Not counted as employed are persons who are laid off, on leave without pay, or on strike for the entire period, or who are hired but have not reported to work during the period.

## Industry Hours and Earnings

Hours and earnings data are derived from reports of payrolls and man-hours for production and related workers in manufacturing and mining, construction workers in contract construction, and nonsupervisory employees in the remaining nonagricultural components. For Federal

Government, hours and earnings relate to all employees, both supervisory and nonsupervisory. Terms are defined below. When the pay period reported is longer than 1 week, figures are reduced to a weekly basis.

Production and related workers include working foremen and all nonsupervisory workers (including leadmen and trainees) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping, maintenance, repair, janitorial and watchman services, product development, auxiliary production for plant's own use (e.g., power plant), and recordkeeping and other services closely associated with the above production operations.

Construction workers include the following employees In the contract construction division: working foremen, journeymen, mechanics, apprentices, laborers, etc., whether working at the site of construction or in shops or yards, at jobs (such as precutting and preassembling) ordinarily performed by members of the construction trades.

Nonsupervisory employees include employees (not above the working supervisory level) such as office and clerical workers, repairmen, salespersons, operators, drivers, physicians, lawyers, accountants, nurses, social workers, research aids, teachers, draftsmen, photographers, beauticians, musicians, restaurant workers, custodial workers, attendants, linemen, laborers, janitors, watchmen, and similar occupational levels, and other employees whose services are closely associated with those of the employees listed.

Payroll covers the payroll for full- and part-time production, construction, or nonsupervisory workers who received pay for any part of the pay period which includes the 12th of the month. The payroll is reported before deductions of any kind, e.g., for old-age and unemployment insurance, group insurance, withholding tax, bonds, or union dues; also included is pay for overtime, holidays, vacations, and sick leave paid directly by the firm. Bonuses (unless earned and paid regularly each pay period), other pay not earned in pay period reported (e.g., retroactive pay), tips, and the value of free rent, fuel, meals, or other payment in kind are excluded. 'Fringe benefits" (such as health and other types of insurance, contributions to retirement, etc. paid by the employer) are also excluded.

Man-hours cover man-hours paid for, during the pay period which includes the 12 th of the month, for production, construction, or nonsupervisory workers. The manhours include hours paid for holidays and vacations, and for sick leave when pay is received directly from the firm.

Overtime hours cover hours worked by production or related workers for which overtime premiums were paid because the hours were in excess of the number of hours of either the straight-time workday or the workweek during the pay period which includes the 12th of the month. Weekend and holiday hours are included only if overtime
premiums were paid. Hours for which only shift differential, hazard, incentive, or other similar types of premiums were paid are excluded.

## Gross Average Hourly and Weekly Earnings

Average hourly earnings are on a "gross" basis, reflecting not only changes in basic hourly and incentive wage rates but also such variable factors as premium pay for overtime and late-shift work and changes in output of workers paid on an incentive plan. Shifts in the volume of employment between relatively high-paid and low-paid work and changes in workers' earnings in individual establishments also affect the general earnings averages. Averages for groups and divisions further reflect changes in average hourly earnings for individual industries.

Averages of hourly earnings differ from wage rates. Earnings are the actual return to the worker for a stated period of time; rates are the amounts stipulated for a given unit of work or time. The earnings series does not measure the level of total labor costs on the part of the employer since the following are excluded: Irregular bonuses, retroactive items, payments of various welfare benefits, payroll taxes paid by employers, and earnings for those employees not covered under the pro-duction-worker, construction worker, or nonsupervisoryemployee definitions.

Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings. Therefore, weekly earnings are affected not only by changes in gross average hourly earnings but also by changes in the length of the workweek, part-time work, stoppages for varying causes, labor turnover, and absenteeism.

## A verage Weekly Hours

The workweek information relates to the average hours for which pay was received and is different from standard or scheduled hours. Such factors as absenteeism, labor turnover, part-time work, and stoppages cause average weekly hours to be lower than scheduled hours of work for an establishment. Group averages further reflect changes in the workweek of component industries.

## Average Overtime Hours

The overtime hours represent that portion of the gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid. If an employee worked on a paid holiday at regular rates, receiving as total compensation his holiday pay plus straight-time pay for hours worked that day, no overtime hours would be reported.

Since overtime hours are premium hours by definition, gross weekly hours and overtime hours do not necessarily move in the same direction from month-tomonth; for example, overtime premiums may be paidfor hours in excess of the straight-time workday although less than a full week is worked. Diverse trends at the in-dustry-group leveI also may be caused by a marked change
in gross hours for a component industry where little or no overtime was worked in both the previous and current months. In addition, such factors as stoppages, absenteeism, and labor turnover may not have the same influence on overtime hours as on gross hours.

## Hours and Earnings For Total Private Nonagricultural Industries

This series covers all nonagricultural industry divisions except government. The principal source of payroll data is Form BLS 790. Secondary source material such as Employment and Wages (Manpower Administration), County Business Patterns (Bureau of the Census), and additional supporting information such as The Hospital Guide, Part II, of the American Hospital Association and special studies by the National Council of Churches supplement data for certain industry groups within the service division.

For a technical description of this series, see the article, "Hours and Earnings for Workers in Private Nonagricultural Industries," published in the May 1967 issue of Employment and Earnings and Monthly Report on the Labor Force.

## Railroad Hours and Eamings

The figures for class $I$ railroads (excluding switching and terminal companies) are based on monthly data summarized in the M-300 report of the Interstate Commerce Commission and relate to all employees except executives, officials, and staff assistants (ICC group I) who received pay during the month. Gross average hourly earnings are computed by dividing total compensation by total hours paid for. Average weekly hours are obtained by dividing the total numberof hours paid for, reduced to a weekly basis, by the number of employees, as defined above. Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings.

## Spendable Average Weekly Earnings

Spendable average weekly earnings in current dollars are obtained by deducting estimated Federal social security and income taxes from gross weekly earnings. The amount of income tax liability depends on the number of dependents supported by the worker and his marital status, as well as on the level of his gross income. To reflect these variables, spendable earnings are computed for a worker with no dependents and a married worker with three dependents. The computations are based on gross average weekly earnings for all production or nonsupervisory workers in the industry division excluding other income and income earned by other family members.
"Real" earnings are computed by dividing the current Consumer Price Index into the earnings averages for the current month. The level of earnings is thus adjusted for changes in purchasing power since the base period (1957-59).

## Average Hourly Earnings Excluding Overtime

Average hourly earnings excluding overtime premium pay are computed by dividing the total productionworker payroll for the industry group by the sum of total production-worker man-hours and one-half of total overtime man-hours. Prior to January 1956, these data were based on the application of adjustment factors to gross average hourly earnings (as described in the Monthly Labor Revieu, May 1950, pp. 537-540). Both methods eliminate only the earnings due to overtime paid for at $1 \frac{1}{2}$ times the straight-time rates. No adjustment is made for other premium payment provisions, such as holiday work, late-shift work, and overtime rates other than time and one-half.

## Indexes of Aggregate Weekly Payrolls and Man-Hours

The indexes of aggregate weekly payrolls and manhours are prepared by dividing the current month's aggregate by the monthly average for the 1957-59 period. The man-hour aggregates are the product of average weekly hours and production-worker employment, and the payroll aggregates are the product of gross average weekly earnings and production-worker employment.

## Labor Turnover

Labor turnover is the gross movement of wage and salary workers into and out of employed status with respect to individual establishments. This movement, which relates to a calendar month, is divided into two broad types: Accessions (new hires and rehires) and separations (terminations of employment initiated by either employer or employee). Each type of action is cumulated for a calendar month and expressed as a rate per 100 employees. The data relate to all employees, whether full- or part-time, permanent or temporary, including executive, office, sales, other salaried personnel, and production workers. Transfers to another establishment of the company are included, beginning with January 1959.

Accessions are the total number of permanent and temporary additions to the employment roll, including both new and rehired employees.

New hires are temporary or permanent additions to the employment roll of persons who have never before been employed in the establishment (except employees transferring from another establishment of the same company) or of former employees not recalled by the employer.

Other accessions, which are not published separately but are included in total accessions, are all additions to the employment roll which are not classified as new hires, including transfers from another establishment of the company.

Separations are terminations of employment during the calendar month and are classified according to cause: Quits, layoffs, and other separations, are defined as follows:

Quits are terminations of employment initiated by employees, failure to report after being hired, and unauthorized absences, if on the last day of the month the person has been absent more than 7 consecutive calendar days.

Layoffs are suspensions without pay lasting or expected to last more than 7 consecutive calendar days, initiated by the employer without prejudice to the worker.

Other separations, which are not published separately but are included in total separations, are terminations of employment because of discharge, permanent disability, death, returement, transfers to another establishment of the company, and entrance into the Armed Forces for a period expected to last more than 30 consecutive calendar days.

## Relationship to Employment Series-

Month-to-month changes in total employment in manufacturing industries reflected by labor turnover rates are not comparable with the changes shown in the Bureau's employment series for the following reasons: (1) Accessions and separations are computed for the entire calendar month; the employment reports refer to the pay period which includes the 12th of the month; and (2) employees on strike are not counted as turnover actions although such employees are excluded from the employment estimates if the work stoppage extends through the report period.

## ESTIMATING METHODS

The principal features of the procedure used to estimate employment for the industry statistics are (1) the use of the "link relative" technique, which is a form of ratio estimation, (2) periodic adjustment of employment levels to new benchmarks, and (3) the use of size and regional stratification.

## The "Link Relative" Technique

From a sample composed of establishments reporting for both the previous and current months, the ratio of current month employment to that of the previous month is computed. This is called a link relative. The estimates of employment (all employees, including production and nonproduction workers together) for the current month are obtained by multiplying the estimates for the previous month by these "link relatives. In addition, small bias correction factors are applied to selected employment estimates each month. The size of the bias correction factors is determined from past experience. Other features of the general procedures are described later in the table, Summary of Methods for Computing Industry Statistics on Employment, Hours, Earnings, and Labor Turnover. Further details are given in the technical notes on Measurement of Employment, Hours, and Earnings in Non-agricultural Industries and on Measurement of Labor Turnover, which are available upon request.

## Size and Regional Stratification

A number of industries are stratified by size of establishment and/or by region, and the stratified produc-
tion- or nonsupervisory-worker data are used to weight the hours and earnings into broader industry groupings. Accordingly, the basic estimating cell for an employment, hours, or earnings series, as the term is used in the summary of computational methods, may be a whole industry or a size stratum, a region stratum, or a size stratum of a region within an industry.

## Benchmark Adjustments

Employment estimates are compared periodically with comprehensive counts of employment which provide "benchmarks" for the various nonagricultural industries, and appropriate adjustments are made as indicated. The industry estimates are currently projected from March 1968 levels. Normally, benchmark adjustments are made annually.

The primary sources of benchmark information are employment data, by industry, compiled quarterly by State agencies from reports of establishments covered under State unemployment insurance laws. These tabulations, covering three-fourths of the total nonagricultural employment in the United States, are prepared under the direction of the Manpower Administration. Benchmark data for the residual are obtained from the records of the Social Security Administration, the Interstate Commerce Commission, and a number of other agencies in private industry or government.

The estimates relating to the benchmark month are compared with new benchmark levels, industry by industry. If revisions are necessary, the monthly series of estimates are adjusted between the new benchmark and the preceding one, and the new benchmark for each industry is then carried forward progressively to the current month by use of the sample trends. Thus, under this procedure, the benchmark is used to establish the level of employment; the sample is used to measure the month-to-month changes in the level. A comparison of the actual amounts of revisions made in the last 3 benchmark years follows:

Nonagricultural payroll employment estimates, by industry division, as a percentage of the benchmark for 1966-1968

| Industry division | 1966 | 1967 | 1968 |
| :---: | :---: | :---: | :---: |
| Total | 99.9 | 100.0 | 100.4 |
| Mining | 100.5 | 99.5 | 101.7 |
| Contract construction | 99.7 | 101.6 | 99.5 |
| Manufacturing . . | 99.4 | 99.5 | 99.8 |
| Transportation and public utilities. $\qquad$ | 99.7 | 99.8 | 100.7 |
| Wholesale and retail trade. | 100.1 | 100.7 | 100.3 |
| Finance, insurance, and real estate. . . . . . . | 99.5 | 100.2 | 99.2 |
| Services. | 100.3 | 99.8 | 99.2 |
| Government. | 100.0 | 100.0 | 102.8 |

Data for all months since the last benchmark to which the series has been adjusted are subject to revision. To provide users of the data with a convenient reference source for the revised data, the BLS publishes as soon as possible after each benchmark revision a summary volume of employment, hours, earnings, and labor turnover statistics.

## THE SAMPLE

## Design

The sampling plan used in the current employment statistics program is known as "sampling proportionate to average size of establishment." This design is an optimum allocation design among strata since the sampling variance is proportional to the average size of establishments. The universe of establishments is stratified first by industry and then within each industry by size of establishment in terms of employment. For each industry, the number of sample units is distributed among the size class cells on the basis of average employment per establishment in each cell. In practice, this is equivalent to distributing the predetermined total number of establishments required in the sample among the cells on the basis of the ratio of employment in each cell to total employment in the industry. Within each noncertainty stratum the sample members are selected at random.

Under this type of design, large establishments fall into the sample with certainty. The size of the samples for the various industries is determined empirically on the basis of experience and of cost considerations. In a manufacturing industry in which a high proportion of total employment is concentrated in relatively few establishments, a large percentage of total employment is included in the sample. Consequently, the sample design for such industries provides for a complete census of the larger establishments with only a few chosen from among the smaller establishments or none at all if the concentration of employment is great enough. On the other hand, in an industry in which a large proportion of total employment is in small establishments, the sample design calls for inclusion of all large establishments and also for a substantial number of the smaller ones. Many industries in the trade and service divisions fall into this category. To keep the sample to a size which can be handled by available resources, it is necessary to accept samples in these divisions with a smaller proportion of universe employment than is the case for most manufacturing industries. Since individual establishments in these nonmanufacturing divisions generally show less fluctuation from regular cyclical or seasonal patterns than establishments in manufacturing industries, these smaller samples (in terms of employment) generally produce reliable estimates.

In the context of the BLS employment and labor turnover statistics programs, with their emphasis on pro-
ducing timely data at minimum cost, a sample must be obtained which will provide coverage of a sufficiently large segment of the universe to provide reasonably reliable estimates that can be published promptly and regularly. The present sample meets these specifications for most industries. With its use, the BLS is able to produce preliminary estimates each month for many industries and for many geographic levels within a few weeks after reports are mailed by respondents, and at a somewhat later date, statistics in considerably greater industrial detail.

## Coverage

The BLS sample of establishment employment and payrolls is the largest monthly sampling operation in the field of social statistics. The table that follows shows the approximate proportion of total employment in each Industry division covered by the group of establishments furnishing monthly employment data. The coverage for individual industries within the division may vary from the proportions shown.

Approximate size and coverage of BLS employment and payrolls sample, March $1968{ }^{1}$

| Industry division | Number of establishments in sample | Employees |  |
| :---: | :---: | :---: | :---: |
|  |  | Number reported | Per- <br> cent <br> of <br> total |
| Mining . | 2,200 | 274,000 | 47 |
| Contract construction | 16,200 | 772,000 | 26 |
| Manufacturing . . . . . . . . . | 46,100 | 12,422,000 | 64 |
| Transportation and public utilities: |  |  |  |
| Railroad transportation (ICC) . . . . . . . . . . . . . | 100 | 636,000 | 96 |
| Other transportation and public utilities... . . . . . | 7,100 | 2,042,000 | 57 |
| Wholesale and retail trade. | 39,700 | 2,815,000 | 21 |
| Finance, insurance and real estate. . . . . . . . . . . | 9,400 | 1,239,000 | 37 |
| Services. | 22,400 | 2,227,000 | 21 |
| Government: |  |  |  |
| Federal (Civil Service |  |  |  |
| Commission) ${ }^{2}$. | 3,200 | 2,699,000 | 100 |
| State and local | 9,400 | 4,907,000 | 54 |

${ }^{1}$ Since a few establishments do not report payroll and man-hour information, hours and earnings estimates may be based on a slightly smaller sample than employment estimates.
${ }^{2}$ State and area estimates of Federal employment are based on reports from a sample of Federal establishments, collected through the BLS-State cooperative program.

The table below shows the approximate coverage, in terms of employment, of the labor turnover sample.

Approximate size and coverage of BLS labor turnover sample, March 1968

| Industry | Employees |  |
| :---: | :---: | :---: |
|  | Number <br> reported | Percent <br> of total |
| Manufacturing . . . . . . | $11,060,000$ | 57 |
| Metal mining. . . . . . | 49,100 | 74 |
| Coal mining. ....... | 59,800 | 44 |
| Communication: | ... | 632,400 |
| Telephone . . . . . | 78 |  |
| Telegraph . . . . . | 22,400 | 69 |

## Reliability of the Employment Estimates

The estimates derived from the establishment survey may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures. The relatively large size of the BLS establishment sample assures a high degree of accuracy. However, since the link relative technique requires the use of the previous month's estimate as the base in computing the current month's estimate, small sampling and response errors may cumulate over several months. To remove this accumulated error, the estimates are adjusted annually to new benchmarks. In addition to the sampling and response errors, the benchmark revision adjusts the estimates for changes in the industrial classification of individual establishments (resulting from changes in their product which are not reflected in the levels of estimates until the data are adjusted to new benchmarks). In fact, at the more detailed industry levels, particularly within manufacturing, changes in classification are the major cause of benchmark adjustments. Another cause of differences, generally minor, arises from improvements in the quality of the benchmark data. (A detailed description of the March 1968 benchmark is available from the Bureau upon request.)

One measure of the reliability of ratio estimates is the root mean square error (RMSE). This measure is the standard deviation adjusted for the bias in ratio estimates $\left(\right.$ RMSE $=\sqrt{\left.(\text { Standard Deviation })^{2}+(\text { Bias })^{2}\right)}$. If the bias is small, the chances are about 2 out of 3 that an estimate from the sample would differ from its benchmark by less than the root mean square error. The chances are about 19 out of 20 that the difference would be less than twice the root mean square error.

Approximations of the root mean square errors (based on the experience of the last several years) of differences between final estimates and benchmarks are presented in the following table.

| Root-mean-square errors of differences <br> between benchmarks and estimates |  |
| :---: | :---: |
| Size of employment <br> estimate | Root-mean-square <br> error |
| 50,000 | 2,000 |
| 100,000 | 2,600 |
| 200,000 | 3,600 |
| 500,000 | 7,000 |
| $1,000,000$ | 11,600 |
| $2,000,000$ | 18,400 |

${ }^{1}$ Assuming 12 -month intervals between benchmark revisions.

For the most recent months, estimates of employment, hours, and earnings are preliminary and are so footnoted in the tables. These figures are based on less than the total sample and are revised when all the reports in the sample have been received. The table below presents root-mean-square-errors of the amounts of

Errors of preliminary employment estimates

| Size of empl. <br> estimate | Root-mean-square error of |  |
| :---: | :---: | :---: |
|  | Monthly level | Month-to-month <br> change |
| 50,000 | 600 | 600 |
| 100,000 | 900 | 900 |
| 200,000 | 1,700 | 1,700 |
| 500,000 | 3,000 | 2,800 |
| $1,000,000$ | 4,300 | 4,000 |
| $2,000,000$ | 8,000 | 8,000 |
| $10,000,000$ | 29,600 | 27,600 |
| Total Nonag. empl. | 84,000 | 74,000 |

revision that may be expected between the preliminary and final levels of employment and preliminary and final month-to-month changes. Revisions of preliminary hours and earnings estimates are normally not greater than . 1 of an hour for weekly hours or 1 cent for hourly earnings.

## STATISTICS FOR STATES AND AREAS

State and area employment, hours, earnings, and labor turnover data are collected and prepared by State agencies in cooperation with BLS. The area statistics relate to metropolitan areas. Definitions for all areas are published each year in the issue of Employment and Earnings that contains State and area annual averages (usually the May issue). Changes in definitions are noted as they occur. Additional industry detail may be obtained from the State agencies listed on the inside back cover of each issue. These statistics are based on the same establishment reports used by BLS for preparing national estimates. For employment, the sum of the State figures may differ slightly from the equivalent official U.S. cocals on a national basis, because some States have more recent benchmarks than others and because of the effects of differing industrial and geographic stratification.

For the States and the areas shown in the B and C sections of this periodical, all the annual average data for the detailed industry statistics currently published by each cooperating State agency are presented (from the earliest date of availability of each series) in a summary volume published annually by the BLS.

## UNEMPLOYMENT INSURANCE DATA

Insured unemployment represents the number of persons reporting a week of unemployment under an unemployment insurance program. It includes some persons who are working part time who would be counted as employed in the payroll and household surveys. Excluded are persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (agriculture, State and local government, domestic service, self-employment, unpaid family work, nonprofit organizations, and firms below a minimum size). The rate of insured unemployment is the number of insured unemployed expressed as a percent of average covered employment in a 12 -month period ending 6 to 8 months prior to the week of reference. Initial
claims are notices filed by those losing jobs covered by an unemployment insurance program that they are starting a period of unemployment. A claimant who continues to be unemployed a full week is then counted in the insured unemployment figure.

Because of differences in State laws and procedures under which unemployment insurance programs are operated, State unemployment rates generally indicate, but do not precisely measure, differences among the individual States. Persons wishing to receive a detailed description of the nature, sources, inclusions and exclusions, and limitations of unemployment insurance data should address their inquiries to Manpower Administration, Washington, D.C.

Many economic statistics reflect a regularly recurring seasonal movement which can be estimated on the basis of past experience. By eliminating that part of the change which can be ascribed to usual seasonal variation, it is possible to observe the cyclical and other nonseasonal movements in the series. However, in evaluating deviations from the seasonal pattern--that is, changes in a seasonally adjusted series--it is important to note that seasonal adjustment is merely an approximation based on past experience. Seasonally adjusted estimates have a broader margin of possible error than the original data on which they are based, since they are subject not only to sampling and other errors but, in addition, are affected by the uncertainties of the seasonal adjustment process itself. Seasonally adjusted series for selected labor force and establishment data are published regularly in Employment and Earnings.

The seasonal adjustment method used for these series is an adaptation of the standard ratio-to-moving average method, with a provision for "moving" adjustment factors to take account of changing seasonal patterns. A detailed description of the method is given in the booklet, The $B L S$ Seasonal Factor Method (1966), which may be. obtained from the Bureau on request.

For establishment data, the seasonally adjusted series on weekly hours and labor turnover rates for industry groupings are computed by applying factors directly to the corresponding unadjusted series. However, seasonally adjusted employment totals for all employees and production workers by industry division are obtained by summing seasonally adjusted data for the component industries. Indexes of aggregate weekly man-hours, seasonally adjusted, for mining, contract construction, and the major industries in manufacturing are obtained by multiplying average weekly hours, seasonally adjusted, by production workers, seasonally adjusted, and dividing by the 1957-59 base. For total, manufacturing, and durable and nondurable goods, the indexes of aggregate weekly man-hours, seasonally adjusted, are obtained by summing the aggregate weekly man-hours, seasonally adjusted, for the appropriate component industries and dividing by the 1957-59 base.

The seasonally adjusted establishment data for Federal Government are based on a series which excludes the Christmas temporary help employed by the Post Office Department in December. The employment of these workers constitutes the only significant seasonal change in Federal Government employment during the winter months. Furthermore, the volume of such employment may change substantially from year to year because of administrative decisions by the Post Office Department. Hence, it was considered desirable to exclude this group from the-data upon which the seasonally adjusted series is based. Factors currently in use for the establishment data are shown in the July 1969 Employment and Earnings, and revisions will be made coincidental with the adjustment of series to new benchmark levels.

For each of the three major labor force components-agricultural and nonagricultural employment and unem-ployment--data for four age-sex groups (male and female workers under age 20 and age 20 and over) are separately adjusted for seasonal variation and are then added to give seasonally adjusted total figures. In order to produce seasonally adjusted total employment and civilian labor force data, the appropriate series are aggregated. The seasonally adjusted rate of unemployment is derived by dividing the seasonally adjusted figure for total unemployment (the sum of four seasonally adjusted age-sex components) by the figure for the seasonally adjusted civilian labor force (the sum of twelve seasonally adjusted age-sex components).

The seasonal adjustment factors applying to current data are based on a pattern shown by past experience. These factors are revised in the light of the pattern revealed by subsequent data. Revised seasonally adjusted series for major components of the labor force based on data through December'1968 are published in the February 1969. Employment and Earnings and Monthly Report on the Labor Force. Revisions will be made annually as each additional year's data become available.

## ATTENTION

As discussed in the Technical Note, the Bureau periodically adjusts the industry employment series to a recent benchmark to improve their accuracy. These adjustments may al so affect the hours and earnings series because employment levels are used as weights. Industry data for all national series shownin this report have been adjusted to March 1968 benchmarks. Data from April 1968 forward are subject to revision at the time of the next benchmark.

Beginning with the July 1969 and subsequent issues of Employment and Earnings, the national data in sections B, $C$, and D supersede those publishedin previousissues, as well as those appearing in the Handbook of Labor Statistics, 1969. Comparable data will be published in Employment and Earnings, United States, 1909-69, BLS Bulletin $1312-7$.
on Employment, Hours, Earnings, and Lahor Turnover

| Item | Basic estimating cells (iadustry, region, size, or region/size cell) | Aggregate industry levels (divisions, groups and, where stratified, individual cells) |
| :---: | :---: | :---: |
|  | Monthly Data |  |
| All employees | All-employee estimate for previous month multiplied by ratio of all employees in current month to all employees in previous month, for sample establishments which reported for both months. | Sum of all-employee estimates for component cells. |
| Production or nonsupervisory workers; women employees. | All-employee estimate for current monch multi plied by (1) ratio of production or nonsupervisory workers to all employees in sample establishments for current month, (2) ratio of women to all employees. | Sum of production- or nonsupervisory-worker estimates, or estimates of women employees, for component cells. |
| Gross average weekly hours . : | Production- or nonsupervisory-worker man-hours divided by number of production or nonsupervisory workers. | Average, weighted by production- or nonsuper-visory-worker employment, of the average weekly hours for component cells. |
| Average weekly overtime hours | Production-worker overtime man-hours divided by number of production workers. | Average, weighted by production-worker employment, of the average weekly overtime hours for component cells. |
| Gross average hourly, earning' | Total production- or nonsupervisory-worker payroll divided by total production- or nonsuper-visory-worker man-hours. | Average, weighted by aggregate man-hours, of the average hourly earnings for component cells. |
| Gross average weekly eamings. . | Product of gross average weekly hours and average hourly earnings. | Product of gross average weekly hours and average hourly earnings. |
| Labor turnover rates . . | The number of particular actions (e.g., quits) in reporting firms divided by total employment in those firms. The result is multiplied by 100. | Average, weighted by employment, of the rates for component cells. |
|  | Annual Average Dafa |  |
| All employees and production or nonsupervisory workers. | Sum of monthly estimates divided by 12. | Sum of monthly estimates divided by 12. |
| Gross average weekly hours | Annual total of aggregate man-hours (productionor nonsupervisory-worker employment multiplied by average weekly hours) divided by annual sum of employment. | Annual total of aggregate man-hours for production or nonsupervisory werkers divided by annual sum of employment for these workers. |
| Average weekly overtime hours . . | Annual total of aggregate overtime man-hours (production-worker emp'oyment multiplied by average weekly overtime hours) divided by annual sum of employment. | Annual total of aggregate overtime man-hours for production workers divided by annual sum of employment for these workers. |
| Gross a verage hourly earnings | Annual total of aggregate payrolls (productionor nonsupervisory-worker employment multiplied by weekly earnings) divided by annual aggregate man-hours. | Annual total of aggregate payrolls divided. by annual aggregare man-hours. |
| Gross average weekly earnings . . | Product of gross average weekly hours and average hourly earnings. | Product of gross average weekly hours and average hourly earnings. |
| Labor turnover tares. . | Sum of monthly rates divided by 12. | Sum of monthly rates divided by 12. |
