## CAUTION

Periodically, the Bureau adjusts the industry employment series to a recent bencmark to improve their accuracy. These adjustments may also affect the hours and earnings series because employment levels are used as weights. All industry statistics after Varch 1963, the present benchmark date, are therefore subject to revision.

Beginning with December 1964 and subsequent issues of Employment and Earnings, data in tables B-l through $\bar{B}-6, C-1$ through $C-7$, and $D-1$ through D-4 are based on March 1963 benchmarks. Therefore, issues of Fmployment and Farnings prior to December 1964 cannot be used in conjunction with national industry data now shown in sections $B$, $C$, and D. Comparable data for prior periods will be published in Employment and Earnings Statistics for the United States, 1909-64, BIS Bulletin 1312-2.

When industry data are again adjusted to new benchmarks another edition of Employment and Earninge Statistics for the United States wil be isaued containing the revised data extending from April 1963 forward to a current date, as well as the prior historical statistics.

## ANNOUNCEMENT

## ESTABLISHMENT DATA REVISED

The national figures on employment in industry, shown in this report, have been adjusted to March 1963 benchmarks (comprehensive counts of employment). This benchmark revision, which is a standard feature of the current employment statistics program, affected industry payroll employment data from April 1962 forward. In addition, because the employment figures are used as weights, the adjustment to new benchmark levels has caused revisions, in some cases, in the hours, earnings, and labor turnover series. The article, "BLS Establishment Employment Estimates Revised to March 1963 Benchmark Levels," that follows, summarizes the effects of this revision. National data published in this issue of Employment and Earnings represent revisions of those appearing in prior monthly issues.

## SPECIAL SECTION

Summary tables of revised establishment data are presented, by month from January 1962 through August 1964, for the major industry series. Both actual and seasonally adjusted figures are given. (See page 7l.)

As in the past, new seasonal adjustment factors for the establishment data have been developed coincidentally with the adjustment to new benchmark levels. These new factors for all of the seasonally adjusted establishment data in Employment and Earnings are shown beginning on page 77 .

## NEW REFERENCE VOLUMES

Employment and Earnings Statistics for the United States, 1909-64, BLS Bulletin 1312-2, to be available in January 1965, replaces BLS Bulletin 1312-1 issued in 1963. All series presented in this bulletin have been adjusted to March 1963 benchmarks. For each national series shown in the B, C, and D sections of Employment and Earnings, detailed data are provided from the earliest date of availability through August 1964.

Employment and Earnings Statistics for States and Areas, 1939-63, BLS Bulletin 1370-1, released last September, replaces BLS Bulletin 1370. Data include annual averages for more than 6,000 series on payroll employment, and over 3,000 series on hours and earnings for the 50 States, the District of Columbia, and 151 major metropolitan areas.

# BLS Establishment Employment Estimates <br> Revised to March 1963 Benchmark Levels 

In this issue of Employment and Earnings, the national employment estimates derived from the monthly establishment survey have been adjusted to actual employment levels for March 1963. This has involved revising all figures back to March 1962. Such revisions to new benchmark levels, an essential part of the employment and labor turnover statistics program, are made annually for most sectors of the economy. Most published series are affected by the revision, beginning at the finest industrial classification level and extending through successively inclusive series to total nonagricultural employment. Estimates of hours and earnings and labor turnover, which are weighted by employment estimates, may also be revised as a result of the changes in employment levels. The current estimates of employment in nonagricultural establishments are derived from reports submitted each month by a sample of the Nation's industrial, commercial, and government establishments. The monthly changes shown by the sample are used to carry forward estimates of the total in each industry. Since the monthly data are estimates, periodic checks of their accuracy are needed. The sample-derived data are thus checked once each year against a benchmark, or complete count, the most recent representing employment for March 1963.

## Benchmark Sources

The most important source of benchmark data is the compulsory unemployment insurance contributions (tax) report that the covered employer files each quarter with his State employment security agency. After the employers' reports are processed, classified, and tabulated by industry, each State forwards its data to the U.S. Department of Labor's Bureau of Employment Securiry (BES), which has Federal supervisory authority over the unemployment insurance systems of the States. The employment counts are then made available by BES to the Bureau of Labor Statistics, for use in preparing the national benchmarks.

These unemployment insurance figures are augmented by data from other sources to bring the benchmarks up to complete counts for all nonagricultural establishments. State unemployment insurance data constitute about three-fourths of the universe, but employers of fewer than four persons are excluded from coverage in some States and certain types of activities are, likewise, not covered. Important
*Of the Division of Industry Employment Statistics, Bureau of Labor Statistics.

Dorothy Hinton* sources of benchmark data for employment not covered by unemployment insurance include the Social Security Administration (small firms and nonprofit organizations), Bureau of the Census (State and local governments), the Civil Service Commission (Federal civilian employment), and the Interstate Commerce Commission (interstate railroads). ${ }^{1}$

## Estimates Near Benchmark Levels

A measure of the accuracy of the BLS national employment estimates is provided by a comparison with the benchmark, which shows the amount of error that has accumulated over 12 months through use of the sample, and through changes in the industrial classification of individual plants. Table 1 presents this comparison, as of March 1963, for total nonagricultural employment and broad industry divisions.

| Industry division | Empioyment |  | Difference between benchmark and estimates |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Benchmark | $\begin{gathered} \text { BLS } \\ \text { estímates } \end{gathered}$ | Number of employees | Percent |
| Total | 55,184 | 55,714 | 530 | 1.0 |
| Mining . . . . . . . . | 614 | 616 | 2 | . 3 |
| Contract construction. | 2,518 | 2,556 | 38 | 1.5 |
| Manufacturing | 16,731 | 16,756 | 25 | . 1 |
| Durable goods | 9,477 | 9,508 | 31 | . 3 |
| Nondurable goods. . | 7,254 | 7,248 | -6 | -. 1 |
| Transportation and public utilities. | 3,847 | 3,847 | 0 | 0 |
| Wholesale and retail trade . . . . . . . . | 11,434 | 11,497 | 63 | . 6 |
| Wholesale trade | 3,048 | 3,069 | 21 | . 7 |
| Retail trade. | 8,386 | 8,428 | 42 | . 5 |
| Finance, insurance, and real estate . . . . | 2,832 | 2,825 | -7 | -. 2 |
| Service and miscelIaneous . . . . . . . . . | 8,014 | 8,076 | 62 | . 8 |
| Government. | 9,194 | 9,541 | 347 | 3.8 |
| Federal Government | 2,334 | 2,334 | 0 | 0 |
| State and local government . . . . . | 6,860 | 7,207 | 347 | 5.1 |

[^0]In most instances for recent revisions, major industry divisions have varied from benchmarks by less than 1 percent. A comparison of the size of the revisions made since 1957 is presented in table 2.

Table 2. Nonagricultural Employment Estimates, by Industry Division, as a Percentage of the Benchmark
for Recent Years

| Industry division | 1957 | 19591 | 1961 | 1962 | 1963 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Total | 100.5 | 99.4 | 100.0 | 99.3 | 101.0 |

| Service and miscellaneous . . . . . | 101.7 | 98.5 | 99.4 | 98.0 | 100.8 |
| Government | 96.7 | 100.0 | 100.0 | 100.0 | 103.8 |
| Federal | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 |
| State and local. | 95.3 | 100.0 | 100.0 | 100.0 | ${ }^{105.1}$ |

${ }^{1}$ Excludes adjustment caused by revision to the classification in the 1957 SIC Manual and by the addition of categories of employees not previously included in estimates.
${ }^{2}$ State and local benchmark derived from October 1962 Census of Governments. Last previous revision of estimates was made to benchimarks based on April 1957 Census of Governments.

Compared with the benchmark count of 55.2 million workers on establishment payrolls for March 1963, the..total nonagricultural figure based on the sample was higher by 530,000 , or 1 percent. Of the eight broad industry divisions, six, accounting for about 80 percent of nonfarm employment at that time, differed by less than 1 percent--mining, manufacturing, transportation-public utilities, trade, finance-insurance-real estate, and service. Of the two remaining divisions, contract construction estimates were 1.5 percent higher than the benchmark and government estimates were 4 percent higher, caused by a revision of the State and local government series.

About 30 percent of total nonagricultural employment is in manufacturing. For this division, with 16.7 million employees, the difference between the benchmark and the estimate was only 0.1 percent. Because turns in the economy are frequently forecast by changes first occurring in this sector, the accuracy of employment estimates for manufacturing is particularly important.

Due to the importance of manufacturing, estimates are published in substantial industry detail. Of the 21 major manufacturing groups, 16 groups, with over 80 percent of manufacturing employment, differed from the benchmark by 1 percent or less
(table 3). Shifts in the industrial classification of several large plants caused much of the difference in ordnance, machinery, and electrical equipment. The effect of changes in industry classification is discussed in detail in the next section.

The major manufacturing industry groups are further subdivided, into the 3- and 4-digit (SIC) industries for which employment estimates are presented in this publication each month. Of the 120 3 -digit industries, 96 , or more than three-fourths, varied from their benchmarks by less than 3 percent (table 4).

The government estimates differed from the benchmark by 4 percent because of revision in the State and local government series. The Federal employment figure is not revised, since the monthly data are total counts prepared by the U.S. Civil Service Commission. State and local government estimates had been projected from a benchmark derived from the 1957 Census of Governments. The March 1963 benchmark is derived from the October 1962 Census of Governments. The long interval between benchmarks--5 years instead of the 1-year interval at which benchmarks can be constructed for most other sectors--contributed to the relatively large difference between the estimates and benchmark, particularly in the public education series. From October 1957 to October 1962, the estimates showed an average growth of 5 percent per year; whereas, the actual annual average growth was 4 percent during that period.

## Reasons Estimates Differ from Benchmarks

Benchmarks and estimates differ mainly because the change that is actually occurring in employment is not precisely reflected by the experience of establishments included in the sample. As the number of employees included in the sample establishments approaches the complete count, the sampling error, or the gap between the results obtained from a sample and those that would have been secured if a complete count had been taken, diminishes. However, important constraints operate to limit the size of the sample. Cost and promptness in publishing the estimates each month are prime considerations. To mail, review, and prepare estimates from several million reports, even with the use of modern highspeed equipment, would be excessively expensive and time-consuming compared with the cost of publishing estimates derived from the approximately 130,000 reports which constitute the BLS sample.

Table 3. Comparison of BLS Manufacturing Employment Estimates with March 1963 Benchmarks by Major Industry Group
(Workers in thousands)

| Major industry group | Employment |  | Difference between benchmark and estimate |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Benchmark | BLS estimate | Number of employees | Percent |
| Manufacturing | 16,731 | 16,756 | 25 | 0.1 |

${ }^{1} 3$-digit industries classified according to the 1957 Standard Industrial Classification Manual and published by BLS.

Within the confines of the financial and personnel resources available, the objective is to design a sample which will minimize the error in the resulting estimates. Here a knowledge of employment fluctuations in the various industries is brought into play. A relatively small sample may suffice for industries in which employment is either relatively stable or fluctuates in regular seasonal pattems. However, in industries where employment movements are highly sensitive to economic conditions and cyclical changes, a larger sample coverage is needed. Manufacturing industries, particularly durable-goods producing industries, illustrate this condition. Fortunately, hard-goods manufacturing industries are frequently characterized by large units so that a sample consisting of relatively few reports might represent a substantial part of total employment.

In addition to sampling and reporting errors, the other major reason that estimates differ from the benchmark levels is the change in industrial classification of establishments since the last previous benchmark adjustment. Establishments are classified by industry according to their major product. Many plants make more than one product. When the composition of their output changes so that what was once a secondary product becomes a primary one, the classification of the establishment is changed to the industry of its new major product. This change is not introduced into the employment estimates at the time it occurs, but only at the time of the annual benchmark adjustment, on the basis of product information reported annually. Thus, differences between estimates and benchmarks for an industry may result because the estimates are tied to the former benchmark levels and do not reflect intervening classification changes.

## Relation of Benchmarks to Hours, Earnings and Labor Turnover Series

The BLS computes series on average hourly eamings, average weekly hours, and labor turnover rates for a large number of industries. For the primary estimating group-the most detailed industries --the hours, earnings, and labor turnover series are computed directly from reported figures. Series for more inclusive industries, however, require a weighting mechanism to yield meaningful averages. To compute this average for the broader industry groupings, the average in each industry is weighted by the number of workers in that industry. The benchmarks provide a means of maintaining the accuracy of these weights.

Differences between the benchmarks and the estimates may result in a reallocation of weights. However, to influence the average for a broad group, the changes have to be large and must affect industries which have substantially higher or lower averages than do other industries in their group. The changes caused by using employment figures revised to the latest benchmark (March 1963), as weights for hours, earnings, and labor tumover, were small. ${ }^{2}$

## Only Benchmarks Published for Some Industries

Benchmarks for industry divisions are actually the aggregates of a large number of primary industry benchmarks ${ }^{3}$ or combinations of the primary industries. Employment estimates for most of the industries are published monthly. However, for a number of industries, particularly in the service division, the estimates fall short of established standards and cannot be published separately on a monthly basis. They are, therefore, absorbed in totals for more inclusive industry aggregates.

The employment estimates for the industries which are not published each month can, however, be published for the benchmark month. The employment benchmarks for these individual industries, together with the industry division totals, are provided in table 5 for the most recent benchmark periods: March 1959, March 1961, March 1962, and March 1963.

[^1]Table 5. Employment estimates for industries not published monthly, ${ }^{1}$ March 1959, 1961, 1962, and 1963

[^2]Table A-1: Employment status of the noninstitutional population 14 years and over, 1929 to date

${ }^{1}$ Data for 1947-56 adjusted to reflect changes in che definicion of employment and unemployment adopted in January 1957. Two groups averaging about one-quarter million workers which were formerly classified as employed (with a job but not at work)-chose on cemporary layoff and those waiting to start new wage and salary jobs within 30 days-were assigned to different classifications, moscly to the unemployed. Data by sex, shown in table $A-2$, were adjusted for the years $1948-36$.
${ }^{2}$ Not a available.
${ }^{3}$ Beginning 1953, labor force and employment figures are not strictly comparable with previous years as a result of the incroduction of material from the 1950 Census into the estimating procedure. Population levels were raised by about 600,000 ; labor force, total employment, and agricultural employment by about 350,000 , primarily affecting the figures for total and males. Orher categories were relatively unaffected.

SData include Alaska and Hawaii beginaing 1960 and are therefore not strictly comparable with previous years. This inclusion has resulted in an increase of about half a million in the coninstirutional pupalation 14 years of age and over, and about 300,000 in the labor force, four-fifths of this in nonagricultural employment. The levels of other labor force categories were not appreciably changed.
${ }^{5}$ Figures for periods prior to April 1962 are aot strictly comparable with current data because of the introduction of 1960 Census data into the estimation procedure. The change primarily affected the labor force and employment totals, which were reduced by about 200,000 . The unemployment torals were virtually unchanged.

NOTE: Data include Alaska and Hawaii beginning 1959. This inclusion has resulted in an increase of 212,000 ( 0.4 percent) in the nonagricultural total for the March 1959 benchmark month.
Data for the 2 most recent months are preliminary.

See footnotes at end of table. NOTE: Data for the 2 most recent months are pre liminary

$\mathbf{1 F o r}^{1}$ mining and manufacturing, data refer to production and related workers; for contract construction, to construction workers; and for all other induseries, to nonsupervisory workers.
${ }^{2}$ Not available.
${ }^{3}$ Data relate to employees in such occupations in the telephone industry as switchbord operators; service assistants; operating room instructors; and pay-station attendants. In 1963, such employees made up 32 percent of the total number of nonsupervisory employees in establisbments reporting hours and earnings data. ${ }^{4}$ Data relate to employees in such occupations in the telephone industry as central office craftrmen; iostallation and exchange repair craftsmen; line, cable, and conduit craftsmen; and laborers. In 1963 , such employees made up 31 percent of the total number of nonsupervisory employees in establishments reporting hours and earnings data.
${ }^{5}$ Data relate to nonsupervisory employees except messengers.
${ }^{6}$ Data exclude eating and drinking places.
${ }^{7}$ Beginning Jaduary 1964, data exclude earnings of nonoffice salesmen and are not necessarily comparable with series for prior years.
${ }^{8}$ Money payments only; additional value of board, room, uniforms, and tips, not included.
${ }^{9}$ Beginning January 1964, data relate to aonsupervisory workers and are not comparable with the production worker levels of prior years. NOTE: Data for the 2 most recent months are preliminary.

${ }^{1}$ Beginning with January 1959, transfers between establishments of the same firm are included in total accessions and total separations, therefore rates for these iterns are nor strictly comparable with prior data. Transfers comprise part of other accessions and other separations, the rates for which are not shown separately.

NOTE: Data include Alaska and Hawaii beginning 1959. This inclusion has not signific antly affected che labor turnover series.
Data for the current month are preliminary.

## SEASONAL FACTORS

The following tables present seasonal adjustment factors for all series in the establishment section of this periodical, which have been revised, as in the past, coincidental with the adjustment of the industry employment series to new benchmarks. These factors will be revised at the time the industry employment statistics are again adjusted to later benchmarks and more current data are available. The seasonal movements are measured in order to adjust the data statistically for such recurring events as warm and cold weather, crop-growing cycles, holidays, vacations, regular industry model changeover periods, and the like. These movements are generally the largest single component of month-to-month changes in employment, hours, and labor turnover. The seasonal factors which follow enable the analyst to remove these influences from the data in order to determine more basic trends.

1/ Seasonally adjusted data derived by summation of components.

#### Abstract

Additional information concerning the preparation of the labor force, employment, hours and earnings, and labor turnover series--concepts and scope, survey methods, and limitations--is contained in technical notes for each of these series, available from the Bureau of Labor Statistics free of charge. Use order blank on page 13-E.

## INTRODUCTION

The statistics in this periodical are compiled from two major sources: (1) household interviews and (2) payroll reports from employers.

Data based on bousebold interviews are obtained from a sample survey of the population. The survey is conducted each month by the Bureau of the Census for the Bureau of Labor Statistics and provides a comprehensive measure of the labor force, i.e., the total number of persons 14 years of age and over who are employed or unemployed. It also provides data on their personal and economic characteristics such as age, sex, color, marital status, occupations, hours of work, and duration of unemployment. The information is collected by trained interviewers from a sample of about 35,000 households throughout the country and is based on the activity or status reported for the calendar week including the 12 th of the month.

Data based on establisbment payroll records are compiled each month from mail questionnaires by the Bureau of Labor Statistics, in cooperation with State agencies. The payroll survey provides detailed industry information on nonagricultural wage and salary employment, average weekly hours, average hourly and weekly earnings, and labor turnover for the Nation, States, and metropolitan areas.

The figures are based on payroll reports from a sample of establishments employing about 25 million nonfarm wage and salary workers. The data relate to all workers, full- or part-time, who received pay during the payroll period which includes the 12 th of the month.
Relation between the household and payroll series
The household and payroll data supplement one another, each providing significant types of information that the other cannot suitably supply. Population characteristics, for example, are readily obtained only from the household survey whereas detailed industrial classifications can be reliably derived only from establishment reports.

Data from these two sources differ from each other because of differences in definition and coverage, sources of information, methods of collection, and estimating procedures. Sampling variability and response errors are additional reasons for discrepancies. The factors which have a differential effect on levels and trends of the two series are described as follows:

## Employment

Coverage. The household survey definition of employment comprises wage and salary workers (including domestics and other private household workers), selfemployed persons, and unpaid workers who worked 15 hours or more during the survey week in family-operated enterprises. Employment in both farm and nonfarm industries is included. The payroll survey covers only wage and salary employees on the payrolls of nonfarm establishments.

Multiple jobholding. The household approach provides information on the work status of the population without duplication since each person is classified as employed, unemployed, or not in the labor force. Employed persons holding more than one job are counted only once, and are classified according to the job at which they worked the greatest number of hours during the survey week. In the figures based on establishment records, persons who worked in more than one establishment during the reporting period are counted each time their names appear on payrolls.

Unpaid absences from jobs. The household survey includes among the employed all persons who had jobs but were not at work during the survey week--that is, were not working or looking for work but had jobs from which they were temporarily absent because of illness, bad weather, vacation, labor-management dispute, or because they were taking time off for various other reasons, whether or not they were paid by their employers for the time off. In the figures based on payroll reports, persons on paid sick leave, paid vacation, or paid holiday are included, but not those on leave without pay for the entire payroll period.

## Hours of Work

The household survey measures hours actually worked whereas the payroll survey measures hours paid for by employers. In the household survey data, all persons with a job but not at work are excluded from the hours distributions and the computations of average hours. In the payroll survey, employees on paid vacation, paid holiday, or paid sick leave are included and assigned the number of hours for which they were paid during the reporting period.

## Comparability of the household interview data with other series

Unemployment insurance data. The unemployed total from the household survey includes all persons whe did
not work at all during the survey week and were looking for work or were waiting to be called back to a job from which they had been laid off, regardless of whether or not they were eligible for unemployment insurance. Figures on unemployment insurance claims, prepared by the Bureau of Employment Security of the Department of Labor, exclude persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (agriculture, State and local government, domestic service, self-employed, unpaid family work, nonprofit organizations, and firms below a minimum size).

In addition, the qualifications for drawing unemployment compensation differ from the definition of unemployment used in the household survey. For example, persons with a job but not at work and persons working only a few hours during the week are sometimes eligible for unemployment compensation, but are classified as employed rather than unemployed in the household survey.

Agrict ltural em ployment estimates of the Department of Agriculture. The principal differences in coverage are the inclusion of persons under 14 in the Statistical Research Service (SRS) series and the treatment of dual jobholders who are counted more than once if they worked on more than one farm during the reporting period. There are also wide differences in sampling techniques and collecting and estimating methods, which cannot be readily measured in terms of impact on differences in level and trend of the two series.

Comparability of the payroll employment data with other series

Statistics on manufactures and business, Bureau of the Census. BLS establishment statistics on employment differ from employment counts derived by the Bureau of the Census from its censuses or annual sample surveys of manufacturing establishments and the censuses of business establishments. The major reasons for some noncomparability are different treatment of business units considered parts of an establishment, such as central administrative offices and auxiliary units, the industrial classification of establishments, and different reporting patterns by multiunit companies. There are also differences in the scope of the industries covered, e.g., the Census of Business excludes contract construction, professional services, public utilities, and financial establishments, whereas these are included in. BLS statistics.

County Business Patterns. Data in County Business Patterns, published jointly by the U.S. Departments of Commerce and Health, Education, and Welfare, differ from BLS establishment statistics in the treatment of central administrative offices and auxiliary units. Differences may also arise because of industrial classification and reporting practices. In addition, CBP excludes interstate railroads and government, and coverage is incomplete for some of the nonprofit activities.

Employment covered by State unemployment insurance programs. Not all nonfarm wage and salary workers are covered by the unemployment insurance programs. All workers in certain activities, such as interstate railroads, are excluded. In addition, small firms in covered industries are also excluded in 32 States. In general, these are establishments with less than four employees.

## Labor Force Data

## COLLECTION AND COVERAGE

Statistics on the employment status of the population, the personal, occupational, and other economic characteristics of employed and unemployed persons, and related labor force data are compiled for the BLS by the Bureau of the Census in its Current Population Survey (CPS). (A detailed description of this survey appears in "Concepts and Methods Used in Housebold Statistics on Employment and Unemployment from the Current Pop. ulation Survey", Bureau of Labor Statistics Report No. 279. This report is available from BLS on request.)

These monthly surveys of the population are conducted with a scientifically selected sample designed to represent the civilian noninstitutional population 14 years and over. Respondents are interviewed to obtain information about the employment status of each member of the household 14 years of age and over. The inquiry relates to activity or status during the calendar week, Sunday through Saturday, which includes the 12 th of the month. This is known as the survey week. Actual field interviewing is conducted in the following week.

Inmates of institutions and persons under 14 years of age are not covered in the regular monthly enumera-
tions and are excluded from the population and labor force statistics shown in this report. Data on members of the Armed Forces, who are included as part of the categories "total noninstitutional population" and "total labor force," are obtained from the Department of Defense.

Until August 1962, the sample for CPS was spread over 333 areas. Between August 1962 and March 1963 , the number of sample areas was increased to 357 , comprising 701 counties and independent cities, with coverage in 50 States and the District of Columbia. This revision takes account of the changes in population distribution and characteristics shown by the 1960 Census. The number of households remains unchanged at 35,000 .

Each month, 35,000 occupied units are designated for interview. About 1,500 of these households are visited but interviews are not obtained because the occupants are not found at home after repeated calls or are unavailable for other reasons. This represents a noninterview rate for the survey of about 4 percent. In addition to the 35,000 occupied units there are 5,000 sample units in an average month which are visited but found to be vacant or otherwise not to be ehumerated. Part of the sample is changed each month. The rotation plan provides for approximately three-fourths of the sample to be common from one month to the next, and one-half to be common with the same month a year ago.

## CONCEPTS

Employed Persons comprise (a) all those who during the survey week did any work at all either as paid employees, or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (b) all those who were not working or looking for work but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for various other reasons, whether or not they were paid by their employers for the time off.

Each employed person is counted only once. Those who held more than one job are counted in the job at which they worked the greatest number of hours during the survey week.

Included in the total are employed citizens of foreign countries, temporarily in the United States, who are not living on the premises of an Embassy (e.g., Mexican migratory farm workers).

Excluded are persons whose only activity consisted of work around the house (such as own home housework, and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations.

Unemployed Persons comprise all persons who did not work at all during the survey week and were looking for work, regardless of whether or not they were eligible for unemployment insurance. Also included as unemployed are those who did not work at all and (a) were waiting to be called back to a job from which they had been laid off; or (b) were waiting to report to a new wage or salary job within 30 days (and were not in school during the survey week); or (c) would have been looking for work except that they were temporarily ill or believed no work was available in their line of work or in the community. Persons in this latter category will usually be residents of a community in which there are only a few dominant industries which were shut down during the survey week. Not included in this category are persons who say they were not looking for work because they were too old, too young, or handicapped in any way.

The Unemployment Rate represents the number unemployed as a percent of the civilian labor force, i.e., the sum of the employed and unemployed. This measure can also be computed for groups within the labor force classified by sex, age, marital status, color, etc. When applied to industry and occupation groups, the labor force base for the unemployment rate also represents the sum of the employed and the unemployed, the latter classified according to industry and occupation of their latest full-time civilian job.

Duration of Unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work or would have been looking for work except for temporary illness, or belief that no work was available in their line of work or in the community. For persons on layoff, duration of anemployment represents the number of full weeks since the termination of
their most recent employment. Average duration is an arithmetic mean computed from a distribution by single weeks of unemployment.

The Civilian Labor Force comprises the total of all civilians classified as employed or unemployed in accordance with the criteria described above. The "total labor force" also includes members of the Armed Forces stationed either in the United States or abroad.

Not in Labor Force includes all civilians 14 years and over who are not classified as employed or unemployed. These persons are further classified as "engaged in own home housework," "in school," "unable to work", because of long-term physical or mental illness, and "other." The "other" group includes for the most part retired persons, those reported as too old to work, the voluntarily idle, and seasonal workers for whom the survey week fell in an "off" season and who were not reported as unemployed. Persons doing only incidental unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation, Industry, and Class of Worker apply to the job held in the survey week. Persons with two or more jobs are classified in the job at which they worked the greatest number of hours during the survey week. The occupation and industry groups used in data derived from the CPS household interviews are defined as in the 1960 Census of Population. Information on the detailed categories included in these groups is available upon request.

The industrial classification system used in the Census of Population and the current Population Survey differs some what from that used by the BLS in its reports on employment, by industry. Employment levels by industry from the household survey, although useful for many analytical purposes, are not published in order to avoid public misunderstanding since they differ from the payroll series because of differences in classification, sampling variability, and other reasons. The industry figures from the household survey are used as a base for published distributions on hours of work, unemployment rates, and other characteristics of industry groups such as age, sex, and occupation.

The class-of-worker breakdown specifies "wage and salary workers," subdivided into private and government workers, "self-employed workers," and "unpaid family workers." Wage and salary workers receive wages, salary, commission, tips, or pay in kind from a private employer or from a governmental unit. Self-employed persons are those who work for profit or fees in their own business, profession, or trade, or operate a farm. Unpaid family workers are persons working without pay for 15 hours a week or more on a farm or in a business operated by a member of the household to whom they are related by blood or marriage.

Hours of Work statistics relate to the actual number of hours worked during the survey week. For example, a person who normally works 40 hours a week but who was off on the Veterans Day holiday would be reported as working 32 hours even though he was paid for the holiday.

For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the week. However, all the hours are credited to the major job.

Persons who worked 35 hours or more in the survey week are designated as working "full time"; persons who worked between 1 and 34 hours are designated as working "part time." Part-time workers are classified by their usual status at their present job (either full time or part time) and by the ir reason for working part time during the survey week (economic or other reasons). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find fulltime work. "Other reasons" include: Labor dispute, bad weather, own illness, vacation, demands of home housework, school, no desire for full-time work and fulltime worker only during peak season.

## ESTIMATING METHODS

The estimating procedure is essentially one of using sample results to obtain percentages of the population in a given category. The published estimates are then obtained by multiplying these percentage distributions by independent estimates of the population. The principal steps involved are shown below. Under the estimation methods used in the CPS, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. There are no subsequent adjustments to independent benchmark data on labor force, employment, or unenployment. Therefore, revisions of the historical data are not an inherent feature of this statistical program.

1. Nonimterview adjustment. The weights for all interviewed households are adjusted to the extent needed to account for occupied sample households for which no information was obtained because of absence, impassable roads, refusals, or unavailability for other reasons. This adjustment is made separately by groups of sample areas and, within these, for six groups - color (white and nonwhite) within the three residence categories (urban, rural nonfarm, and rural farm). The proportion of sample households not interviewed varies from 3 :o 5 percent depending on weather, vacations, etc.
2. Ratio estimates. The distribution of the population selected for the sample may differ somewhat, by chance, from that of the Nation as a whole, in such characteristics as age, color, sex, and residence. Since these population characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio estimates as follows:
a. First-stage ratio estimate. This is the procedure in which the sample proportions are weighted by the known 1960 Census data on the color-residence distribution of the population. This step takes into account the differences existing at the time of the 1960 Census between the color-residence distribution for the Nation and for the sample areas.
b. Second-stage ratio estimate. In this step, the sample proportions are weighted by independent
current estimates of the population by age, sex, and color. These estimates are prepared by carrying forward the most recent census data (1960) to take account of subsequent aging of the population, mortality, and migration between the United States and other countries.
3. Composite estimate procedure. In deriving statistics for a given month, a composite estimating procedure is used which takes account of net changes from the previous month for continuing parts of the sample ( 75 percent) as well as the sample results for the current month. This procedure reduces the sampling variability especially of month-to-month changes but also of the levels for most items.

## Reliability of the Estimates

Since the estimates are based on a sample, they may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures.

The standard error is a measure of sampling variability, that is, the variations that might occur by chance because only a sample of the population is surveyed. The chances are about 2 out of 3 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 19 out of 20 that the difference would be less than twice the standard error.

Table A shows the average standard error for the major employment status categories, by sex, computed from data for past months. Estimates of change derived from the survey are also subject to sampling variability. The standard error of change for consecutive months is also shown in table A. The standard errors of level shown in table $A$ are acceptable approximations of the standard errors of year to y ear change.

| Average stondard or status (In thous | or of major em ategories <br> nds) | oyment |
| :---: | :---: | :---: |
| Employment status and sex | Average standard error of- |  |
|  | Monthly leval | Month-to-month change (consecutive months only) |
| BOTH SEXES |  |  |
| Labor force and total employment Agriculture . . . . . . . . . . . . . . Nonagricultural employment. . . . Unemployment.. | 250 200 300 100 | 180 120 180 100 |
| MALE |  |  |
| Labor force and total employment | 120 | 90 |
| Agriculture . . . . . . . . . . . . . | 180 | 90 |
| Nonagricultural employment. | 200 | 120 |
| Unemployment . . . . . . . . . . . | 75 | 90 |
| FEMALE |  |  |
| Lobor force and total employment | 180 | 150 |
| Agriculture . . . . . . . . . . . . . | 75 | 55 |
| Nonagricultural employment. . . . | 180 | 120 |
| Unemployment . . . . . . . . . . . | 65 | 65 |

The figures presented in table B are to be used for other characteristics and are approximations of the standard errors of all such characteristics. They should be interpreted as providing an indication of the order of magnitude of the standard errors rather than as the precise standard error for any specific item.

The standard error of the change in an item from one month to the next month is more closely related to the standard error of the monthly level for that item than to the size of the specific month-to-month change itself. Thus, in order to use the approximations to the standard errors of month-to-month changes as presented in table $C$, it is first necessary to obtain the standard error of the monthly level of the item in table $B$, and then find the standard error of the month-to-month change in table C corresponding to this standard error of level. It should be noted that table $C$ applies to estimates of change between 2 consecutive months. For changes between the current month and the same month last year, the standard errors of level shown in table B are acceptable approximations.

Table B. Standard error of lovel of monthly estimates

| Size of estimate | Both sexes |  | Male |  | Female |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 20,000 | 180 | . . | 150 | $\ldots$ | 170 | . |
| 30,000 . . | 210 | . $\cdot$ | $\cdots$ | $\ldots$ | . . | . |
| 40,000 . . . | 220 | . . | $\ldots$ |  |  |  |

Illustration: Assume that the tables showed the total number of persons working a specific number of hours as $15,000,000$, an increase of 500,000 over the previous month. Linear interpolation in the first column of table B shows that the standard error of $15,000,000$ is about 160,000 . Consequently, the chances are about 68 out of 100 that the sample estimate differs by less than 160,000 from the figure which would have been obtained from a complete count of the number of persons working the given number of hours. Using the 160,000 as the
standard error of the monthly level in table $C$, it may be seen that the standard error of the 500,000 increase is about 135,000 .

Table C. Stondard error of estimates of month-to-month change

| (In thousands) |  |  |
| :---: | :---: | :---: |
| Standard error of monthly level | Standard error of month-to-month change |  |

| 300 . . . . . . . . . . . . . . . | -•• | 220 |

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Where the numerator is a subclass of the denominator, estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerator of the percentage, particularly if the percentage is large ( 50 percent or greater). Table $D$ shows the standard errors for percentages derived from the survey. Linear interpolation may be used for percentages and base figures not shown in table $D$.

Table D. Standard error of percentages

| Base of percentages (thousands) | Estimated percentage |  |  |  |  |  |  |  |  |

## COLLECTION

Payroll reports provide current information on wage and salary employment, hours, earnings, and labor turnover in nonfarm establishments, by industry and geographic location.

## Federal-State Cooperation

Under cooperative arrangements with State agencies, the respondent fills out only one employment or labor turnover schedule, which is then used for national, State, and area estimates. This eliminates duplicate reporting on the part of respondents and, together with the use of identical techniques at the national and State levels, insures maximum geographic comparability of estimates.

State agencies mail the forms to the establishments and examine the returns for consistency, accuracy, and completeness. The States use the information to prepare State and area series and then send the data to the BLS for use in preparing the national series.

## Shuttle Schedules

Two types of data collection schedules are used: Form BLS 790-Monthly Report on Employment, Payroll, and Hours; and Form DL 1219-Monthly Report on Labor Turnnver. These schedules are of the "shutcle" type, with space for each month of the calendar year. The schedule is returned to the respondent each month by the collecting agency so that the next month's data can be entered. This procedure assures maximum comparability and accuracy of reporting, since the respondent can see the figures he has reported for previous months.

The BLS 790 provides for entry of data on the number of full- and part-time workers, on the payrolls of nonagricultural establishments and, for most industries, payroll and man-hours of production and related workers or nonsupervisory workers for the pay period which most nearly coincides with the standard survey reference week (the calendar week, Sunday through Saturday, which includes the 12th of the month). The labor turnover schedule provides for the collection of information on the total number of accessions and separations, by type, during the calendar month.

## CONCEPTS

## Industrial Classification

Establishments are classified into industries on the basis of their principal product or activity determined from information on annual sales volume. This information is collected each year on an industry class supplement to the monthly 790 or 1219 report. In the case of an establishment making more than one product or engaging in more than one activity, the entire employment of the establishment is included under the industry indicated by the most important product or activity.

All national, State, and area employment, hours, earnings, and labor turnover series are classified in accordance with the Standard Industrial Classification Manual, Bureau of the Budget, 1957. Since many of the published industry series represent combinations of SIC industries, the BLS has prepared a Guide to Employment Statistics of BLS, 1961 which specifies the SIC code or codes covered by each industry title listed in Employment and Earnings. In addition, the Guide provides industry definitions and lists the beginning date of each series. The Guide is available free upon request.

## Industry Employment

Employment data for all except the Federal Government refer to persons on establishment payrolls who received pay for any part of the pay period which includes the 12th of the month. For Federal Government establishments, employment figures represent the number of persons who occupied positions on the last day of the calendar month. Intermittent workers are counted if they performed any service during the month.

The data exclude proprietors, the self-employed, unpaid family workers, farm workers, and domestic workers in households. Salaried officers of corporations are included. Government employment covers only civilian employees; Federal military personnel are excluded from total nonagricultural employment.

Persons on an establishment payroll who are on paid sick leave (when pay is received directly from the firm), on paid holiday or paid vacation, or who work during a part of the pay period and are unemployed or on strike during.the rest of the period, are counted as employed. Not counted as employed are persons who are laid off, on leave without pay, or on strike for the entire period, or who are hired but do not report to work during the period.

## Industry Hours and Eamings

Hours and earnings data are derived from reports of payrolls and man-hours for production and related workers, construction workers, or nonsupervisory employees. These terms are defined below. When the pay period reported is longer than 1 week, the figures are reduced to a weekly basis.

Production and related workers include working foremen and all nonsupervisory workers (including leadmen and trainees) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping, maintenance, repair, janitorial and watchman services, product development, auxiliary production for plant's own use (e.g., power plant), and recordkeeping and other services closely associated with the above production operations.

Construction workers relate to the following employees in the contract construction division: Working foremen, journeymen, mechanics, apprentices, laborers, etc., whether working at the site of construction or in shops or yards, at jobs (such as precutting and preassembling) ordinarily performed by members of the construction trades.

Nonsupervisory employees include employees (not above the working supervisory level) such as office and clerical workers, repairmen, salespersons, operators, drivers, attendants, service employees, linemen, laborers, janitors, watchmen, and similar occupational levels, and other employees whose services are closely associated with those of the employees listed.

Payroll covers the payroll for full-and part-time production, construction, or nonsupervisory workers who received pay for any part of the pay period which includes the 12 th of the month. The payroll is reported before deductions of any kind, e.g., for old-age and unemployment insurance, group insurance, withholding tax, bonds, or union dues; also included is pay for overtime, holidays, vacations, and sick' leave paid directly by the firm. Bonuses (unless earned and paid regularly each pay period), other pay not earned in pay period reported (e.g., retroactive pay), and the value of free rent, fuel, meals, or other payment in kind are excluded.

Man-bours cover man-hours worked or paid for, during the pay period which includes the 12th of the month, for production, construction, and nonsupervisory workers. The man-hours include hours paid for holidays and vacations, and for sick leave when pay is received directly from the firm.

Overtime bours cover premium overtime hours of production and related workers during the pay period which includes the 12th of the month. Overtime hours are those for which premiums were paid because the hours were in excess of the number of hours of either the straight-time workday or workweek. Weekend and holiday hours are included only if premium wage rates were paid. Hours for which only shift differential, hazard, incentive, or other similar types of premiums were paid are excluded.

## Gross Average Hourly and Weekly Earnings

Average hourly earnings for manufacturing and nonmanufacturing industries are on a "gross" basis, reflecting not only changes in basic hourly and incentive wage rates, but also such variable factors as premium pay for overtime and late-shift work, and changes in output of workers paid on an incentive plan. Shifts in the volume of employment between relatively high-paid and low-paid work and changes in workers' earnings in individual establishments also affect the general earnings averages. Averages for groups and divisions further reflect changes in average bourly earnings for individual industries.

Averages of hourly earnings differ from wage rates. Earnings are the actual return to the worker for a stated period of time, while rates are the amounts stipulated for a given unit of work or time. The earnings series, however, does not measure the level of total labor costs on the part of the employer since the following are excluded: Irregular bonuses, retroactive items, payments of various welfare benefits, payroll taxes paid by employers, and earnings for those employees not covered under the pro-duction-worker or nonsupervisory-employee definitions.

Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings. Therefore, weekly earnings are affected not only by
changes in gross average hourly earnings, but also by changes in the length of the workweek, part-time work, stoppages for varying causes, labor turnover, and absenteeism.

## Average Weekly Hours

The workweek information relates to the average hours for which pay was received, and is different from standard or scheduled hours. Such factors as absenteeism, labor turnover, part-time work, and stoppages cause average weekly hours to be lower than scheduled hours of work for an establishment. Group averages further reflect changes in the work week of component industries.

## Average Overtime Hours

The overtime hours represent that portion of the gross average weekly hours which were in excess of regular hours and for which premium payments were made. If an employee worked on a paid holiday at regular rates, receiving as total compensation his holiday pay plus straight-time pay for hours worked that day, no overtime hours would be reported.

Since overtime hours are premium hours by definition, gross weekly hours and overtime hours do not necessarily move in the same direction, from month-to-month; for example, premiums may be paid for hours in excess of the straight-time workday although less than a full week is worked. Diverse treads at the industry-group level may also be caused by a marked change in gross hours for a component industry where little or no overtime was worked in both the previous and current months. In addition, such factors as stoppages, absenteeism, and labor turnover may not have the same influence on overtime hours as on gross hours.

## Railroad Hours and Earnings

The figures for class I railroads (excluding switching and terminal companies) are based on monthly data summarized in the $\mathrm{M}-300$ report of the Interstate Commerce Commission and relate to all employees who received pay during the month, except executives, officials, and staff assistants (ICC group I). Gross average hourly earnings are computed by dividing total compensation by total hours paid for. Average weekly hours are obtained by dividing the total number of hours paid for, reduced to a weekly basis, by the number of employees, as defined above. Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings.

## Spendable Average Weekly Earnings

Spendable average weekly earnings in current dollars are obtained by deducting estimated Federal social security and income taxes from gross weekly earnings. The amount of income tax liability depends on the number of dependents supported by the worker, as well as on the level of his gross income. To reflect these variables, spendable earnings are computed for a worker with no dependents, and a worker with three dependents. The computations are based on the gross average weekly earnings for all production or nonsupervisory workers in the industry division without regard to marital status, family composition, or total family income.
"Real" earnings are computed by dividing the current Consumer Price Inder into the earnings averages for the current month. The resulting level of earnings erpressed in 1957-59 dollars is thus adjusted for changes in purchasing power since the base period.

## Average Hourly Earnings Excluding Overtime

Average hourly earnings excluding premium overtime pay are computed by dividing the total productionworker payroll for the industry group by the sum of total production-worker man-hours and one-half of total overtime man-hours. Prior to January 1956, these data were based on the application of adjustment factors to gross average hourly earnings (as described in the Monsbly Labor Review, May 1950, pp. 537-540). Both methods eliminate only the earnings due to overtime paid for at $11 / 2$ times the straight-time rates. No adjustment is made for other premium payment provisions, such as holiday work, late-shift work, and overtime rates other than time and one-half.

## Indexes of Aggregate Weekly Payrolls and Man-Hours

The indexes of aggregate weekly payrolls and manhours are prepared by dividing the current month's aggregate by the monthly average for the 1957-59 period. The man-hour aggregates are the product of average weekly hours and production-worker employment, and the payroll aggregates are the product of gross average weekly earnings and production-worker employment.

## Labor Tumovar

Labor turnover is the gross movement of wage and salary workers into and out of employed status with respect to individual establishments. This movement, which relates to a calendar month, is divided into two broad types: Accessiows (new hires and rehires) and separations (terminations of employment initiated by either employer or employee). Each type of action is cumulated for a calendar month and expressed as a rate per 100 employees. The data relate to all employees, whether full- or part-time, permanent or temporary, including executive, office, sales, other salaried personnel, and production workers. Transfers to another establishment of the company are included, beginning with January 1959.

Accessions are the total number of permanent and temporary additions to the employment roll, including both new and rehired employees.

New bires are temporary or permanent additions to the employment roll of persons who have never before been employed in the establishment (except employees transferring from another establishment of the same company) or of former employees not recalled by the employer.

Otber accessions, which are not published separately but ate included in total accessions, are all additions to the employment roll which are not classified as new hires, including transfers from another establishment of the company.

Separations are terminations of employment during the calendar month and are classified according to cause: Quits, layoffs, and other separations, as defined as follows:

Quits are terminations of employment initiated by employees, failure to report after being hired, and unauthorized absences, if on the last day of the month the person has been absent more than 7 consecutive calendar days.

Layoffs are suspensions without pay lasting or expected to last more than 7 consecutive calendar days, initiated by the employer without prejudice to the worker.

Other separations, which are not published separately but are included in total separations, are terminations of employment because of discharge, permanent disability, death, retirement, transfers to another establishment of the company, and entrance into the Armed Forces for a period expected to last more than 30 consecutive calendar days.

## Comparability With Employment Series

Month-to-month changes in total employment in manufacturing industries reflected by labor turnover rates are not comparable with the changes shown in the Bureau's employment series for the following reasons: (1) Accessions and separations are computed for the entire calendar month; the employment reports refer to the pay period which includes the 12th of the month; and (2) employees on strike are not counted as turnover actions although such employees are excluded from the employment estimates if the work stoppage extends through the report period.

## ESTIMATING METHODS

The principal features of the estimating procedure used to prepare estimates of employment for the industry statistics are (1) the use of the "link relative" technique, which is a form of ratio estimation, (2) periodic adjustment of employment levels to new benchmarks, and (3) the use of a modified cutoff type of sample.

## The "Link Relative" Technique

From a sample of establishments, which report for both the previous and current months, the ratio of current month employment to that of the previous month is computed. The estimates of employment (all employees, including production and nonproduction workers together) for the current month are obtained by multiplying the estimates for the previous month by these "link relatives." Other features of the general procedures used for estimating industry employment, hours, earnings, and labor turnover statistics are described in the table on page 12-E. Further details are given in the technical notes on Measurement of Employment. Hours, and Earnings in Nonagricultural Industries and on Measurement of Labor Turnover, which are available upon request.

A number of industries are stratified by size of establishment and/or by region, and the stratified produc-tion- or nonsupervisory-worker data are used to weight the hours and earnings into broader industry groupings. Accordingly, the basic estimating cell for an employment, hours, or earnings series, as the term is used in the summary of computational methods on page $12-\mathrm{E}$, may be a whole industry or a size stratum, a region stratum, or a size stratum of a region within an industry.

## Benchmark Adjustments

Employment estimates are periodically compared with comprehensive counts of employment which provide "benchmarks" for the various nonagricultural industries, and appropriate adjustments are made as indicated. The industry estimates are currently projected from March 1963 levels; normally, benchmark adjustments are made annually.

The primary source of benchmark information is the employment data, by industry, compiled quarterly by State agencies from reports of establishments covered under State unemployment insurance laws. These tabulations, covering three-fourths of the total nonfarm employment in the United States, are prepared under the direction of the Bureau of Employment Security. Benchmark data for the residual are obtained from the records of the Social Security Administration, the Interstate Commerce Commission, and a number of other agencies in private industry or government.

The estimates relating to the benchmark month are compared with new benchmark levels, industry by industry. If revisions are necessary, the monthly series of estimates are adjusted between the new benchmark and the preceding one, and the new benchmark for each industry is then carried forward progressively to the current month by use of the sample trends. Thus, under this procedure, the benchmark is used to establish the level of employment, while the sample is used to measure the month-to-month changes in the level.

Data for all months between the previous benchmark and the month in which the adjusted series is published are therefore subject to revision. To provide users of the data with a convenient reference source for the revised data, the BLS publishes as soon as possible after each benchmark revision a summary volume of employment, hours, earnings, and labor turnover statistics. The current volume in this series is Employment and Earnings Statistics for the United States, 1909-64, Bulletin 1312-2 (Dec. 1964), and contains monthly statistics from the earliest date of availability through August 1964.

## THE SAMPLE

## Design

The sample design used in the BLS establishment employment and labor turnover statistics programs is that of a modified cutoff sample. In a cutoff design, all establishments in a category are listed in sequence by number of employees. A cutoff point is selected in terms of the number of employees in an establishment, and only establishments above the cutoff point are included in the design. At present, sample selection is made by the cooperating State agencies at the area level with supplementation for establishments in sections of the State lying outside of the defined areas. The national sample therefore is then the sum of all the State samples.

In cutoff sampling, the general objective is to obtain a sample comprising a large enough proportion of universe employment so that satisfactory estimates can be prepared. Since employer participation in the. BLS programs is voluntary, some establishments above the cutoff may decline to report. To replace these in the design, reports are solicited from the next largest establishments below the cutoff until the desired employment
coverage is attained. In addition, to meet the needs of preparing estimates of weekly hours and hourly earnings, procedures were introduced to secure representation of the smaller establishments in each industry. Because of this procedure, and also because sampling takes place primarily at the level of the metropolitan areas, which vary greatly in size, the sample includes a considerable number of small establishments, together with a very substantial proportion of the larger establishments in American industry.

In the context of the BLS employment and labor turnover statistics program, with their emphasis on producing timely data at minimum cost, a sample must be obtained which will provide coverage of a sufficiently large segment of the universe to provide reasonably reliable estimates that can be published promptly and regularly. The present sample meets these specifications for most industries. With its use, the BLS is able to produce preliminary estimates each month for many industries and for many geographic levels within a few weeks after reports are mailed by respondents, and at a somewhat later date, statistics in considerably greater industrial detail. The tendency of such a sample to produce biased estimates of the level of earnings for certain industries is counteracted by the stratified estimating procedure described under "Estimating Methods."

## Coverage

The BLS sample of establishment employment and payrolls is the largest monthly sampling operation in the field of social statistics. The table that follows shows the approximate proportion of total employment in each industry division covered by the group of establishments furnishing monthly employment data. The coverage for individual industries within the division may vary from the proportions shown.

Approximate size and coverage of BLS employment and payrolls sample, March 19631

| Industry division | Employees |  |
| :---: | :---: | :---: |
|  | Number reported | Percent of total |
| Mining | 287,000 | 47 |
| Contract construction | 582,000 | 23 |
| Manufacturing | 10,753,000 | 64 |
| Transportation and public utilities: |  |  |
| Railraad transportation (ICC) | 737,000 | 97 |
| Other transportation and |  |  |
| public utilitios | 1,711,000 | 55 |
| Wholesale and retail trade | 2,265,000 | 20 |
| Finance, insurance and real estate . . . . . . . . . . . . | 1,020,000 | 36 |
| Service and miscellaneous | 1,541,000 | 19 |
| Government: |  |  |
| Federal (Civil Service |  | 100 |
| State and local . . . . . . . . . . . | 3,334,000 | 50 |

1 Since a few establishments do not report payroll and man. hour information, hours and earnings estimates may be based on a slightly smaller sample than employment estimates.
2 state and area estimates of Federal employment are based on reports from a sample of Federal establishments, collected through the BLS-State cooperative program.

The table below shows the approximate coverage, in terms of employment, of the labor turnover sample.

| Industry | Employees |  |
| :---: | :---: | :---: |
|  | Number reported | Percent of total |
| Monufocturing | 9,131,000 | 55 |
| Mefal mining . | 58,000 | 75 |
| Coal mining . | 62,000 | 42 |
| Communications |  |  |
| Telephone | 578,000 | 85 |
| Telegraph | 25,000 | 73 |

## Reliability of the Employment Estimate

One measure of the reliability of an employment estimate projected from a benchmark is the amount by which it differs from the new benchmark at the next adjustment period. The BLS uses this criterion instead of the standard error of the estimates, since it is not possible to compute a mathematically precise statement of error unless the estimates are based on a probability sample. An approximation of the accuracy of the BLS employment estimates is shown by the following table:

Nonagricultural payroll employment estimates, by industry division, as a percentage of the benchmark for recent years

| Industry division | 1961 | 1962 | 1963 |
| :--- | ---: | ---: | ---: |
| Total . . . . . . . . . . . . . . . | 100.0 | 99.3 | 101.0 |
| Mining . . . . . . . . . . . . . | 99.4 | 99.2 | 100.3 |
| Contract construction. . . . | 99.9 | 93.9 | 101.5 |
| Manufacturing. . . . . . . . | 99.7 | 99.4 | 100.1 |
| Transportation ond public |  |  |  |
| utilities . . . . . . . . . | 100.7 | 100.4 | 100.0 |
| Wholesale and retail frade. . | 100.5 | 100.1 | 100.6 |
| Finance, insurance, and |  |  |  |
| real estate . . . . . . . . | 101.0 | 99.9 | 99.8 |
| Service and miscellaneous . | 99.4 | 98.0 | 100.8 |
| Government . . . . . . . . . | 100.0 | 100.0 | 103.8 |

For some detailed industries, the relative size of the correction to benchmarks is somewhat greater than is indicated for the major industry divisions in the preceding table.

The high degree of reliability of BLS estimates is due to the relatively large percentage of the employment universe covered by the sample, the frequent adjustments of employment estimates to benchmark levels, and the use of special techniques, such as stratification by size and/or region.

Differences between the benchmarks and the estimates, as well as the sampling and response errors, result from changes in the industrial classification of individual establishments (resulting from changes in their product), which are not reflected in the levels of estimates until the data are adjusted to new benchmarks. At more detailed industry levels, particularly within manufacturing, changes in classification are the major cause of benchmark adjustments; however, it becomes of less importance at broader aggregations of industries. Another cause of differences, generally minor, between the estimates and the benchmark arises from improvements in the quality of benchmark data.

For the most recent months, national estimates of employment, hours, and earnings are preliminary, and are so footnoted in the tables. These particular figures are based on less than the full sample and consequently are subject to revisions when all the reports in the sample have been received. Studies of these revisions of preliminary estimates in the past indicate that they have been relatively small (and most frequently upward) for employment, and even smaller for hours and earnings.

## STATISTICS FOR STATES AND AREAS

State and area employment, hours, earnings, and labor turnover data are collected and prepared by State agencies in cooperation with BLS. The area statistics relate to metropolitan areas, as defined in the Annual Supplement Issue of Employment and Earnings. Additional industry detail may be obtained from the State agencies listed on the inside back cover of each issue. These statistics are based on the same establishment reports used by BLS for preparing national estimates. For employment, the sum of the State figures may differ slightly from the equivalent official U.S. totals on à national basis, because some States have more recent benchmarks than others and because of the effects of differing industrial and geographic stratification.

Users of State and area employment, hours, and earnings statistics may be interested in Employment and Earnings Statistics for States and Areas, 1939-63, BLS Bulietin 1370-1. For the States and the areas shown in the $B$ and $C$ sections of this periodical, all the annual average data for the detailed industry statistics currently published by each cooperating State agency are presented from the earliest date of availability of each series through 1963 .

## Seasonal Adjustment

Many economic statistics reflect a regularly recurring seasonal movement which can be estimated on the basis of past experience. By eliminating that part of the change which can be ascribed to usual seasonal variation, it is possible to observe the cyclical and other nonseasonal movements in the series. However, in evaluating deviations from the seasonal pattern-that is, changes in a seasonally adjusted series-it is important to note that seasonal adjustment is merely an approximation based on past experience. Seasonally adjusted estimates have a broader margin of possible error than the original data on which they are based, since they are subject not only to sampling and other errors but, in addition, are affected by the uncertainties of the seasonal adjustment process itself. Seasonally adjusted series for selected labor force and establishment data are published regularly in Employment and Earnings.

The seasonal adjustment method used for these series is an adaptation of the standard ratio-in-movine average method, with a provision for "moving" adjustment factors to take account of changing seasonal patterns. A detailed description and illustration of the basic method was published in the August 1960 Monthly Labor Review, and a revised version is described in the 1962 Report of the President's Committee to Appraise Employment and Unemployment Statistics, Measuring Employment and Unemployment, Appendix G, "The Bureau of Labor Statistics Seasonal Factor Method."

For establishment data, the seasonally adjusted series on weekly hours and labor turnover rates for industry groupings are computed by applying factors directly to the corresponding unadjusted series, but seasonally adjusted employment totals for all employees and production workers by industry divisions are obtained by summing the seasonally adjusted data which are published for component industries. Seasonally adjusted aggregate weekly man-hours for mining, contract construction, and the major industries in manufacturing are obtained by multiplying average weekly hours, seasonally adjusted, by production workers, seasonally adjusted. For total, manufacturing, and
durable and nondurable goods, aggregate weekly manhours, seasonally adjusted, are obtained by summing the aggregate weekly man-hours, seasonally adjusted, for the appropriate component industries.

The seasonally adjusted establishment data for Federal Government are based on a series which excludes the Christmas temporary help employed by the Post Office Department in December. The employment of these workers constitutes the only significant seasonal change in Federal Government employment during the winter months. Furthermore, the volume of such employment may change substantially from year to year because of administrative decisions by the Post Office Department. Hence, it was considered desirable to exclude this group from the data upon which the seasonally adjusted series is based. Factors currently in use for the establishment data are shown in the December 1964 Employment and Earnings, and revisions will be made coincidental with the adjustment of series to new benchmark levels.

For each of the three major labor force compo-nents-agricultural and nonagricultural employment, and unemployment-data for four age-sex groups (male and female workers under age 20 , and age 20 and over) are separately adjusted for seasonal variation and are then added to give seasonally adjusted total figures. In order to produce seasonally adjusted total employment and civilian labor force data, the appropriate series are aggregated. The seasonally adjusted rate of unemployment is derived by dividing the seasonally adjusted figure for total unemployment (the sum of four seasonally adjusted age-sex components) by the figure for the seasonally adjusted civilian labor force (the sum of twelve seasonally adjusted age-sex components).

The seasonal adjustment factors applying to current data are based on a pattern shown by past experience. These factors are revised in the light of the pattern revealed by subsequent data. Revised seasonally adjusted series for major components of the labor force based ondata through December 1963 are published in the February 1964 Employment and Earnings. Revisions will be made annually as each additional year's data become available.
on Employment, Hours, Earnings, and Labor Turnover

| Item | Basic estimating cells (industry, region, size, or region/size cell) | Aggregate industry levels (divisions, groups and, where stratified, individual cells) |
| :---: | :---: | :---: |
|  | Monthly Data |  |
| All employees | All-employee estimate for previous month multiplied by ratio of all employees in current month to all employees in previous month, for sample establishments which reported for both months. | Sum of all-employee estimates for component cells. |
| Production or nonsupervisory workers; women employees. | All-employee estimate for current month multi plied by (1) ratio of production or aonsupervisory workers to all employees in sample establishments for current month, (2) ratio of women to all employees. | Sum of production-or nonsupervisory-worker estimates, or women estimates, for component cells. |
| Gross average weekly hours | Production- or nonsupervisory-worker man-hours divided by number of production or nonsupervisory workers. | Average, weighted by production- or nonsuper-visory-worker employment, of the average weekly hours for component cells. |
| Average weekly overtime hours | Production-worker overtime man-hours divided by number of production workers. | Average, weighted oy production-worker employment, of the average weekly overtime hours for component cells. |
| Gross a verage houcly earnings . | Total production- or nonsupervisory-worker payroll divided by total production- or nonsuper-visory-worker manhours. | Average, weighted by aggregate man-hours, of the average hourly earnings for compunent cells. |
| Gross average weekly eamings . | Product of gross average weekly hours and average hourly earnings. | Product of gross average weekly hours and average hourly earaings. |
| Labor turnover rates (total, men, and women). | The number of particular actions (e.g., quits) in reporting firms divided by total employment in those firms. The result is multiplied by 100. For men (or women), the number of men (women) who quit is divided by the total number of men (women) employed. | Average, weighted by employment, of the rates for component cells. |
|  | Annual Averoge Dafa |  |
| All employees and production or nonsupervisory workers. | Sum of monthly estimates divided by 12. | Sum of monthly estimates divided by 12. |
| Gross average weekly hours | Annual total of aggregate man-hours (productionor nonsupervisory-worker employment multiplied by average weekly hours) divided by annual sum of employment. | Annual cotal of aggregate man-hours for production or nonsupervisory workers divided by annual sum of employment for these workers. |
| Average weekly overtime hours | Annual total of aggregate overtime man-hours (production-worker employment multiplied by average weekly overtime hours) divided by annual sum of employment. | Annual total of aggregate overime man-hours for production workers divided by annual sum of employment for these workers. |
| Gross average hourly earnings | Annual total of aggregate payrolls (productionor nonsupervisory-worker employment multiplied by weekly earnings) divided by annual aggregate manhours. | Annual total of aggregate payrolls divided by annual aggregate man-hours. |
| Gross average weekly eamings. | Product of gross average weekly hours and average hourly earaings. | Product of gross average weekly hours and average hourly eamings. |
| Labor tumover rates . | Sum of monthly rates divided by 12. | Sum of monthly rates divided by 12. |
