Age adjustments to occupational employment data ..... 28
Charts ..... 38
Monthly statistical tables ..... 47
Technical note ..... 135

Unemployment dropped sharply in November, while nonfarm employment was virtually unchanged. The overall unemployment rate, which had risen substantially in September and remained about the same in October, fell from 3.9 to 3.4 percent in November, a return to the August level.

Unemployment rates for secondary work-ers-teenagers, adult women, and part-time workers-were reduced significantly over the month. Among primary breadwinners-adult men, married men, and all full-time workersrates of unemployment also moved down, but more moderately. Jobless rates for blue-collar and manufacturing workers, however, remained at their October levels.

Nonfarm payroll employment remained virtually unchanged in November, after seasonal adjustment, but would have increased modestly except for a large net rise in the number of manufacturing workers off payrolls because of strikes. (Workers on strike are not counted as employed in the payroll employment series, whereas they are classified as employed-with a job but not at work-in the household series.) The slowdown in the pace of payroll employment growth, which began in July, remained evident in November. After allowance for strikes, monthly payroll employment advances have averaged only 80,000 in the June-November period compared to 240,000 in the November 1968 to June 1969 period.

## Unemployment

The number of unemployed persons totaled 2.7 million in November. Unemployment usually rises at this time of year, but this November it dropped, as a number of workers unemployed in October either found jobs or left the labor force. After seasonal adjustment, unemployment was down by 360,000 from October, with nearly all of the decline among workers who were either new entrants or re-entrants to the labor force.

The November drop in unemployment was primarily among teenagers, young men (age 20
to 24), and adult women. Jobless rates for teenagers fell from 13.0 to 11.6 percent, for young men from 6.5 to 5.3 percent, and for adult women from 4.0 to 3.5 percent. The over-themonth declines for teenagers and women reduced these unemployment rates to the post-Korean lows of early 1969, while the rate for young men dropped to its mid-summer level.

Jobless rates also moved down for adult men ( 2.2 percent), married men ( 1.5 percent), and all full-time workers ( 3.0 percent), although not to the same extent as for the more marginal workers. The rates of joblessness among these primary workers dropped back to their August levels but were somewhat above their postKorean lows of early 1969.

Rates of unemployment for white workers (3.1 percent) and Negro workers ( 6.2 percent) were both down over the month. The November rates were about the same as in August but slightly above the rates posted in early 1969.

Despite the declines in jobless rates for most groups of workers, rates for blue-collar workers ( 4.2 percent) and for persons who had last worked in the manufacturing industry (3.8 percent) were unchanged over the month. These rates have risen gradually since late spring. For workers covered under State unemployment insurance programs, the jobless rate move from 2.2 to 2.4 percent over the month. Their rate has also inched upward since late spring.

## Industry Employment

Nonfarm payroll employment was virtually unchanged in November but would have shown a modest gain (about 100,000 ) except for substantially increased strike activity, particularly in manufacturing. Employment gains were reported in State and local government $(50,000)$ and trade and construction ( 35,000 each).

Manufacturing employment declined by 175,000 between October and November. Most of this decline was attributable to new strike
activity in the durable goods industries, primarily in electrical equipment. However, small employment declines were also reported in most other durable goods industries. The nondurable goods industries reported a job gain of 50,000 in November. Nearly all of the increase occurred in the food industry, reflecting the end of a strike and a rise from the artificially low October employment level in this industry which resulted from a late survey week.

## Workweek

The workweek for all rank-and-file workers on private nonagricultural payrolls declined seasonally in November. On a seasonally adjusted basis, the average workweek was unchanged at 37.6 hours, after falling 0.2 hour in October. Except for February 1969, when hours of work were affected by unusually bad weather, this was the lowest level reported since late 1968. A decline in average hours in trade offset longer workweeks in other major industry divisions. The average workweek in manufacturing was unchanged over the month, following a 0.3 hour decline to 40.5 hours in the previous month. The manufacturing workweek was at its lowest level in more than $1-1 / 2$ years (with the exception of February 1969).

For the second month, factory overtime declined, edging down over the month by 0.1 hour to 3.4 hours (seasonally adjusted). In the durable goods sector, overtime registered a 0.3 hour drop from October and was at its lowest point in 2 years (with the exception of April 1968). Since September, overtime in durables has declined
by one-half hour. Overtime hours in nondurable goods industries were unchanged in November.

## Earnings

Average hourly earnings for production and nonsupervisory workers on private payrolls were unchanged in November at $\$ 3.11$. Hourly earnings were up 19 cents, or 6.5 percent, from a year ago.

Average weekly earnings fell by 62 cents in November to $\$ 116.63$, reflecting the seasonal decrease in average weekly hours. Over-themonth declines in construction and trade offset the gains registered in manufacturing and finance, insurance, and real estate. Compared to a year ago, average weekly earnings were upby $\$ 7.13$ ( 6.5 percent).

## Labor Force and Total Employment

The civilian labor force totaled 81.4 million workers in November, about 2.2 million more than a year ago. On a seasonally adjusted basis, nearly three-fifths of the over-the-year rise occurred between November 1968 and February 1969. Labor force growth in recent months has slowed significantly.

Total employment was 78.7 million, up 2.1 million over the year. Total nonagricultural employment, which rose sharply in late 1968 and early 1969 , has shown only moderate growth in the summer and fall of this year. Employment in agriculture has been on an unusually sharp downward trend since February, although it edged up in November.

Regular publication of new data on persons not in the labor force-that is, those who are neither working nor looking for work-begins with this issue of Employment and Earnings and will continue on a quarterly basis. Presentation of these data is designed to answer such questions as: How many of the persons outside the labor force want work but are prevented from looking for a job because of illness, home responsibilities, or other impediments? How many of them are "discouraged workers," that is, persons who are willing and able to work but think that any search for a job would be in vain? How many have worked previously, and when and why did they leave their last job? How many intend to seek work in the near future? 1/

The new information on nonparticipants in the labor force is based on data collected for the Bureau of Labor Statistics by the Bureau of the Census as part of the Current Population Survey (CPS). This nationwide sample survey is conducted monthly in about 50,000 households and provides the basic national labor force and unemployment data. To obtain the new data, a series of special questions on nonparticipation in the labor force-questions 24 A through $24 \mathrm{E}-$ were added beginning in January 1967. (A portion of the questionnaire showing these questions appears on page 6.)

Because a person's reasons for being outside the labor force are not likely to change from 1 month to another, the CPS interviewers ask the special questions in only 1 of the 4 consecutive monthly visits to the household. 2/ Repeating the questions every month would unnecessarily lengthen the interview and may even lead to a reduction in cooperation from some of the respondents.

Since the new data on persons not in the labor force are derived from only one-fourth of the CPS sample (or about 12,500 households), they are subject to somewhat greater sampling
variability than are estimates based on the full sample. It is mainly for this reason that the results are presented on a quarterly average basis. Standard errors for these quarterly data may be approximated by applying a factor of 1.4 to the standard errors of the monthly data from the entire CPS sample, shown in tables B, C, and D of the "Technical Note" in the back of this publication.

## Comparability with Other Data

The new quarterly data on the nonparticipants in the labor force are designed to supplement some limited data which always have been available from the CPS and appear monthly in table A-3 of this publication. The data in this table, however, describe only the major activity of the nomparticipants, who are classified as either "in school," "keeping house," "unable to work," or "other reasons."

By asking the additional questions, some of the nonparticipants now can be placed in two additional categories which better describe their reasons for being outside the labor force. These two categories are: "retirement or old age" and "think cannot get job." More importantly, how many of the nonparticipants want jobs and how
*Of the Division of Employment and Unemployment Analysis, Bureau of Labor Statistics.

1/ Some of these new data on the reasons for nonparticipation in the labor force already have been presented and analyzed in a recent Special Labor Force Report. See Paul O. Flaim, "Persons Not in the Labor Force: Who They Are and Why They Don't Work," Monthly Labor Review, July 1969, pp. 3-14. A companion report now being prepared will focus on the nonparticipants as a labor force reserve.

2/ A household selected for the CPS sample is visited by interviewers for an initial period of 4 consecutive months. The household is then dropped from the survey for an 8-month interval before being returned to the sample for a second 4 -month period.
many intend to seek work in the future can now be determined. Additional information also is gathered about their education, previous work experience, and reasons for leaving their last job.

The classification of the nonparticipants on the basis of the data obtained through this special series of questions ( $24 \mathrm{~A}-\mathrm{D}$ ) is carried out as follows: If he states that he wants a job (24C), he is generally classified according to the reasons for not seeking work cited in answer to 24 D , with ill health and disability given priority over other reasons. If he does not want a job when interviewed but has worked during the preceding 5 years, the nonparticipant is classified either on the basis of his major activity during the reference week (question 19) or his reasons for leaving his last job (24B), whichever is deemed to describe more accurately his current status. If he neither wants a job when interviewed nor has worked in the preceding 5 years, his classification is based solely on his activity during the reference week.

The classification system for the new data on the nonparticipants is not without some problems and limitations. One such problem arises when persons give more than one reason for not seeking work. When this occurs, they are generally classified according to the reason or impediment which is deemed to be the most serious obstacle to participation. Under this system, ill health and disability are given priority over other reasons. Thus, a woman citing both family responsibilities and poor health as reasons for not seeking work would be placed in the "ill health, disability" category. Although both conditions may be equally forbidding to her, she could conceivably make some arrangement whereby she could work despite the family needs, but she would generally have much less control over her health conditions.

Because of technical problems arising from separate estimating procedures, the total number of nonparticipants as computed from the onefourth sample may differ slightly from data derived from the entire CPS. For most demographic groups, these differences are usually very minor.

More important differences between the two series of data arise in the classification of the nonparticipants according to their reasons for not seeking work. These differences are outlined schematically at the end of this article.

## The Tables

The new quarterly data on persons not in the labor force will be presented in 10 special tables. In addition to classifying the nonparticipants according to their reasons for being outside the labor force, these tables also will contain information on the job desire of these persons, their previous work experience, and their future jobseeking intentions.

Three of the 10 tables-1, 6, and 9-will present data only for the most recent quarter. The other seven tables will present data for the comparable year-ago quarter as well as for the most recent one. The 10 tables which are published in this issue on pages $10-17$ cover the third quarter of 1969, and seven of them also present comparable data for the third quarter of 1968.

In addition to these 10 tables, which will be published on a regular quarterly basis, this issue contains a series of special tables which present historical quarterly data on persons outside the labor force from the first quarter of 1967 through the second quarter of 1959. Whereas the data in the regular tables are presented by age group as well as by sex and race, the special tables contain no age detail and more limited coverage of other characteristics.

Portion of Current Population Survey questionnaire showing questions used to obtain data on persons not in labor force

# PRINCIPAL DIFFERENCES BETWEEN TWO SERIES OF DATA ON NONPARTICIPATION IN LABOR FORCE 

Data obtained through regular interview of all nonparticipants in CPS sample

Data obtained through special series of questions asked of one-fourth of nonparticipants in CPS sample
"Going to school"-Includes all the nonparticipants who report "going to school" as their major activity during the reference week (question 19).
"Unable to work"-This group includes only those persons who are afflicted by a physical or mental ailment or disability which is expected to prevent them from working for at least 6 months.
"Keeping house"-This group includes all those persons (mostly women) who report housekeeping as their major activity during the reference week.
"Other reasons"-This group includes all nonparticipants whose activity during the reference week does not fall within the three categories discussed above. (In the new data obtained from
"In school"-In addition to all the nonparticipants who report "going to school" as their major activity during the reference week (question 19), this group includes a small number of persons who, in response to 24 D , give "in school or other training" as their reason for not seeking work. As a result, the number of "in school" nonparticipants obtained through the additional questions asked of one-fourth of the CPS sample is slightly higher (about 1 percent) than the number obtained through the regular interview of the entire sample.
"Ill health, disability"-This group includes all persons who attribute their nonparticipation in the labor force to ill health or disability, regardless of the intensity or expected duration of the condition afflicting them. Consequently, the number of nonparticipants placed in the "ill health or disability category" is about twice as large as the number of nonparticipants classified as "unable to work."
"Home responsibilities"-This category of nonparticipants is roughly synonymous to the "keeping house" group obtained from the entire CPS sample. However, it excludes those persons who, although having kept house during the reference week, cite an illness or disability as the reasons for leaving their last job or as an obstacle to current work-seeking, or who think that it would be impossible for them to find a job. Because of this, the average number of persons placed in the "home responsibilities" category runs about 6 to 7 percent lower than the number classified as "keeping house."
"Retirement or old age"-The nonparticipants placed in this category through the additional questions are part of those who fall within the "other reasons" category in data collected from

Data obtained through regular interview of all nonparticipants in CPS sample

Data obtained through special series of questions asked of one-fourth of nonparticipants in CPS sample
one-fourth of the CPS sample, this group of nonparticipants is divided roughly into the three groups listed in the opposite column: "Retirement or old age," "think cannot get job," and "all other reasons.")
the entire sample. However, this group does not include all persons who might consider themselves "retired" in terms of having permanently separated themselves from their jobs. As used here, the retirement or old age concept applies, first of all, only to persons 60 years and over who have not worked during the previous 5 years and to persons who, regardless of their age, have left their last job because of "retirement or old age." Even within these two groups, however, a person is not classified as retired if reported as either wanting a job, keeping house (which allows few women to be classified as retired), or if prevented from seeking work by an illness or disability.
"Think cannot get job"-This category includes all nonparticipants who say they want a job (24C) but add that they think it would be impossible for them to find work (24D). These persons are often referred to as "discouraged workers."
"All other reasons"-This group includes all the nonparticipants who, even on the basis of their responses to the additional questions, cannot be placed in any of the five categories discussed above.

${ }^{1}$ Oceupational data not available by color.

The minimum age coverage revision for labor force data from 14 to 16 years in. January 1967 prompted a number of immediate adjustments to insure historical comparability. One such adjustment at that time was for occupational employment statistics. Annual average revisions covering the 1958-66 period for the 11 major occupations first appeared in the July 1967 issue of Employment and Earnings, with further breakdowns by sex in the December 1967 issue.

During the last few years, interest in occupational detail by color has greatly increased. The Bureau of Labor Statistics, accordingly, undertook a complete reexamination of the comparability adjustment procedures in order to extend the 16-and-over revisions to color, sex, and more detailed occupations. The nine tables on pages $27-35$ present the results of the reexamination.

The adjustment process used to develop these new estimates was considerably more exacting than the earlier one and was facilitated by utilizing all available information pertinent to 14 and 15 year-olds by sex and occupation for the 195866 period. The procedures were actually divided into two separate techniques, one for 1966 and the other for the years 1958-65.

In 1966, the entire set of statistics had been retabulated on a 16-year-and-over basis in order to assist in the analysis of differences due to the age change. Although not precisely comparable to the official estimates for that year because
certain minor estimating procedures could not be used, the availability of these retabulations permitted a differential adjustment of the detailed occupation statistics, which were ratioed to published employment controls by color and sex for 14 and 15 year-olds. When these specially calculated occupational estimates for 14 and 15 year-olds were resubtracted from the original 14-year-and-over data, comparable 16 and over estimates of detailed occupation by sex and color became available.

For years prior to 1966, adjustments were calculated based upon the following four controls: (1) total employment levels for 14-15 year-olds by sex and color for 1958-65, (2) detailed occupation statistics on 14-17 year-olds by sex for the years 1958-65, (3) unpublished data on 14-15 year-olds by the major occupations and sex, covering the 1961-65 period, and (4) the detailed occupational distribution by color from the 1966 calculations. The first of these four was the overall control, while the other three were the individual occupation controls.

Because of the more detailed micthods, the revised occupation group totals differ somewhat from the earlier estimated annual average occupational data for the 1958-66 period, which have appeared in Employment and Earnings, The Manpower Report of the President, The Handbook of Labor Statistics, and other publications. The new estimates should now be used in lieu of the previously published data. A comparable monthly series on total employment by major occupations will be available in early 1970.

Table 1. Employed persons 16 years and over by occupation, annual averages, 1958-68
All persons
(In thousands)

| Occupation | 1968 | 1967 | 1966 | 1965 | 1964 | 1963 | 1962 | 1961 | 1960 | 1959 | 1958 |

${ }^{1}$ Beginning with January 1999, cransfers berween establishments of the same firm are included in total accessions and total separations, therefore rates for these items are not strictly comparable with prior data. Transfers comprise part of ocher accessions and ocher separations, the rates for which are not shown separately.

NOTE: Data include Alaske and Hawaii beginning 1939. This inclusion has not significantly affected the labor turnover series.
Date for the curreat month are preliminary.
D.2: Labor turnover rates, by industry

${ }^{1}$ Beginning with January 1959, transfers between establishments of the same firm ate included in total accessions and toral separations, therefore rates for these icems are not strictly comparable with prior data. Transfers comprise part of other accessions and other separations, the rates for which are not shown separately.

NOTE: Data include Alaska and Hawaii beginning 1959. This inclusion has not significantly affected the labor turnover series.
Data for the current month are preliminary.

## Technical Note

#### Abstract

Additional information concerning the preparation of the labor force, employment, hours and earnings, and labor turnover series--concepts and scope, survey methods, and limitations--is contained in technical notes for each of these series, available from the Bureau of Labor Statistics free of charge.

## INTRODUCTION

The statistics in this periodical are compiled from three major sources: (1) household interviews, (2) payroll reports from employers, and (3) administrative statistics of unemployment insurance systems.

Data based on household interviews areobtained from a sample survey of the population 16 years of age and over. The survey is conducted each month by the Bureau of the Census for the Bureau of Labor Statistics and provides comprehensive data on the labor force, the employed and the unemployed, including such characteristics as age, sex, color, marital status, occupations, hours of work, and duration of unemployment. The survey also provides data on the characteristics and past work experience of those not in the labor force. The information is collected by trained interviewers from a sample of about 50,000 households, representing 449 areas in 863 counties and independent cities, with coverage in 50 States and the District of Columbia. The data collected are based on the activity or status reported for the calendar week including the 12th of the month.

Data basedonestablishmentpayroll records are compiled each month from mail questionnaires by the Bureau of Labor Statistics, in cooperation with State agencies. The payroll survey provides detailed industry information on nonagricultural wage and salary employment, average weekly hours, average hourly and weekly earnings, and labor turnover for the Nation, States, and metropolitan areas. The figures are based on payroll reports from a sample of establishments employing about 30 million nonagriculture wage and salary workers. The data relate to all workers, full- or part-time, who received pay during the payroll period which includes the 12th of the month.

Data based on administrative records of unemployment insurance systems furnish a complete count of insured unemployment among the two-thirds of the Nation's labor force covered by unemployment insurance programs. Weekly reports, by State, are issued on the number of initial claims, the volume and rate of insured unemployment under State unemployment insurance programs, and the volume under programs of unemployment compensation for Federal employees, ex-servicemen, and railroad workers. These statistics are published by the Manpower Administration, U.S. Department of Labor, in "Unemployment Insurance Claims."

## Relation between the household and payroll series

The household and payroll data supplement one another, each providing significant types of information that the other cannot suitably supply. Population characteristics, for example, are readily obtained only from the household survey whereas detailed industrial classifications can be reliably derived only from establishment reports.

Data from these two sources differ from each other because of differences in definition and coverage, sources of information, methods of collection, and estimating procedures. Sampling variability and response errors are additional reasons for discrepancies. The major factors which have a differential effect on levels and trends of the two series are as follows:

## Employment

Coverage. The household survey definition of employment comprises wage and salary workers (including domestics and other private household workers), selfemployed persons, and unpaid workers who worked 15 hours or more during the survey week in family-operated enterprises. Employment in both agricultural and nonagricultural industries is included. The payroll survey covers only wage and salary employees on the payrolls of nonagricultural establishments.

Multiple jobholding. The household approach provides information on the work status of the population without duplication since each person is classified as employed, unemployed, or not in the labor force. Employed persons holding more than one job are counted only once and are classified according to the job at which they worked the greatest number of hours during the survey week. In the figures based on establishment records, persons who worked in more than one establishment during the reporting period are counted each time their names appear on payrolls.

Unpaid absences from jobs. The household survey includes among the employed all persons who had jobs but were not at work during the survey week--that is, were not working but had jobs from which they were temporarily absent because of illness, bad weather, vacation, labor-management dispute, or because they were taxing time off for various other reasons, even if they were not paid by their employers for the time off. In
the figures based on payroll reports, persons on leave paid for by the company are included, but not those on leave without pay for the entire payroll period.

## Hours of Work

The household survey measures hours actually worked whereas the payroll survey measures hours paid for by employers. In the household survey data, all persons with a job but not at work are excluded from the hours distributions and the computations of average hours. In the payroll survey, employees on paid vacation, paid holiday, or paid sick leave are included and assigned the number of hours for which they were paid during the reporting period.

## Comparability of the household interview data with other series

Unemployment insurance data. The unemployed total from the household survey includes all persons who did not have a job at all during the survey week and were looking for work or were waiting to be called back to a job from which they had been laid off, regardless of whether or not they were eligible for unemployment insurance. Figures on unemployment insurance claims, prepared by the Manpower Administration of the Department of Labor, exclude persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (agriculture, State and local government, domestic service, self employment, unpaid family work, nonprofitorganizations, and firms below a minimum size).

In addition, the qualifications for drawing unemployment compensation differ from the definition of unemployment used in the household survey. For example, persons with a job but not at work and persons working only a few hours during the week are sometimes eligible for unemployment compensation but are classified as employed rather than unemployed in the household survey.

Agricultural employment estimates of the Department of Agriculture. The principal differences in coverage
are the inclusion of persons under 16 in the Statistical Research Service (SRS) series and the treatment of dual jobholders who are counted more than once if they worked on more than one farm during the reporting period. There are also wide differences in sampling techniques and collecting and estimating methods, which cannot be readily measured in terms of impact on differences in level and trend of the two series.

## Comparability of the payroll employment data with other series

Statistics on manufactures and business, Bureau of the Census. BLS establishment statistics on employment differ from employment counts derived by the Bureau of the Census from its censuses or annual sample surveys of manufacturing establishments and the censuses of business establishments. The major reasons for some noncomparability are different treatment of business units considered parts of an establishment, such as central administrative offices and auxiliary units, the industrial classification of establishments, and different reporting patterns by multiunit companies. There are also differences in the scope of the industries covered, e.g., the Census of Business excludes contract construction, professional services, public utilities, and financial establishments, whereas these are included in BLS statistics.

County Business Patterns. Data in County Business Patterns, published jointly by the U.S. Departments of Commerce and Health, Education, and Welfare, differ from BLS establishment statistics in the treatment of central administrative offices and auxiliary units. Differences may also arise because of industrial classification and reporting practices. In addition, CBP éxcludes interstate railroads and government, and coverage is incomplete for some of the nonprofit activities.

Employment covered by State unemployment insurance programs. Not all nonagricultural wage and salary workers are covered by the unemployment insurance programs. All workers in certain activities, such as interstate railroads, are excluded. In addition, small firms in covered industries are also excluded in 31 States. In general, these are establishments with less than four employees.

## Labor Force Data

## COLLECTION AND COVERAGE

Statistics on the employment status of the population, the personal, occupational, and other characteristics of the employed, the unemployed, and persons not in the labor force, and related data are complled for the BLS by the Bureau of the Census in its Current Population Survey (CPS). A detailed description of this survey appears in "Concepts and Methods Used in Manpower Statistics from the Current Population Survey" (BLS Re-
port 313). This report is available from BLS on request.

These monthly surveys of the population are conducted with a scientifically selected sample designed to represent the civilian noninstitutional population 16 years and over. Respondents are interviewed to obtain information about the employment status of each member of the household 16 years of age and over. The inquiry relates to activity or status during the calendar week,

Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted in the following week.

Inmates of institutions and persons under 16 years of age are not covered in the regular monthly enumerations and are excluded from the population and labor force statistics shown in this report. Data on members of the Armed Forces, who are included as part of the categories "total noninstitutional population" and "total labor force," are obtained from the Department of Defense.

Each month, 50,000 occupied units are designated for interview. About 2,250 of these households are visited but interviews are not obtained because the occupants are not found at home after repeated calls or are unavailable for other reasons. This represents a noninterview rate for the survey of about 4.5 percent. In addition to the 50,000 occupied units, there are 8,500 sample units in an average month which are visited but found to be vacant or otherwise not to be enumerated. Part of the sample is changed each month. The rotation plan provides for three-fourths of the sample to be common from one month to the next, and one-half to be common with the same month a year ago.

## CONCEPTS

Employed persons comprise (a) all those who during the survey week did any work at all as paid employees, in their own business, profession, or farm, or who worked 15 hours or more as unpaid workers in an enterprise operated by a member of the family, and (b) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, labor-management dispute, or personal reasons, whether or not they were paid by their employers for the time off, and whether or not they were seeking other jobs.

Each employed person is counted only once. Those who held more than one job are counted in the job at which they worked the greatest number of hours during the survey week.

Included in the total are employed citizens of foreign countries, temporarily in the United States, who are not living on the premises of an Embassy.

Excluded are persons whose only activity consisted of work around the house (such as own home housework, and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations.

Unemployed persons comprise all persons who did not work during the survey week, who made specific efforts to find a job within the past 4 weeks, and who were available for work during the survey week (except for temporary illness). Also included as unemployed are those who did not work at all, were available for work, and (a) were waiting to be called back to a job from which they had been laid off; or (b) were waiting to report to a new wage or salary job within 30 days.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of seeking work. Average duration is an arithmetic mean computed from a distribution by single weeks of unemployment.

Unemployed persons by reasons for unemployment are divided into four major groups. (1) Job losers are persons whose employment ended involuntarily who immediately began looking for work and persons on layoff. (2) Job leavers are persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work. (3) Reentrants are persons who previously worked at a full-time job lasting 2 weeks or longer but who were out of the labor force prior to beginning to look for work. (4) New entrants are persons who never worked at a full-time job lasting 2 weeks or longer.

The civilian labor force comprises the total of all civilians classified as employed or unemployed in accordance with the criteria described above. The "total labor force" also includes members of the Armed Forces stationed either in the United States or abroad.

The unemployment rate represents the number unemployed as a percent of the civilian labor force. This measure can also be computed for groups within the labor force classified by sex, age, marital status, color, etc. The job-loser, job-leaver, reentrant, and new entrant rates are each calculated as a percent of the civilian labor force; the sum of the rates for the four groups thus equals the total tinemployment rate.

Not in labor force includes all civilians 16 years and over who are not classified as employed or unemployed. These persons are further classified as "engaged in own home housework," "in school," "unable to work" because of long-term physical or mental illness, and "other." The "other" group includes for the most part retired persons, those reported as too old to work, the voluntarily idle, and seasonal workers for whom the survey week fell in an "off" season and who were not reported as unemployed. Persons doing only incidental unpaid family work (less than 15 hours) are also classified as not in the labor force.

For persons not in the labor force, data on previous work experience, intentions to seek work again, desire for a job at the time of interview, and reasons for not looking for work are compiled on a quarterly basis. The detailed questions for persons not in the labor force are asked enly in those households that are new entrants to the sample and in those that are reentering the sample after 8 months' absence.

Occupation, industry, and class of worker for the employed apply to the job held in the survey week. Per-
sons with two or more jobs are classified in the job at which they worked the greatest number of hours during the survey week. The unemployed are classified according to their latest full-time civilian job lasting 2 weeks or more. The occupation and industry groups used in data derived from the CPS household interviews are defined as in the 1960 Census of Population. Information on the detailed categories included in these groups is available upon request.

The class-of-worker breakdown specifies "wage and salary workers," subdivided into private and government workers, "self-employed workers," and "unpaid family workers." Wage and salary workers receive wages, salary, commission, tips, or pay in kind from a private employer or from a governmental unit. Self-employed persons are those who work for profit or fees in their own business, profession, or trade, or operate a farm. Unpaid family workers are persons working without pay for 15 hours a week or more on a farm or in a business operated by a member of the household to whom they are related by blood or marriage.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, a person who normally works 40 hours a week but who was off on the Veterans Day holiday would be reported as working 32 hours even though he was paid for the holiday.

For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the week. However, all the hours are credited to the major job.

Persons who worked 35 hours or more in the survey week are designated as working "full time"; persons who worked between 1 and 34 hours are designated as working "part time." Part-time workers are classified by their usual status at their present job (either full time or part time) and by their reason for working part time during the survey week (economic or other reasons). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. "Other reasons" include: Labor dispute, bad weather, own illness, vacation, demands of home housework, school, no desire for full-time work, and full-time worker only during peak season. Persons on full-time schedules include, in addition to those working 35 hours or more, those who worked from 1-34 hours for noneconomic reasons but usually work full time.

Full-and part-time labor force. The full-time labor force consists of persons working on full-time schedules, persons involuntarily working part time (because fulltime work is not available), and unemployed persons seeking full-time jobs. The part-time labor force consists of persons working part time voluntarily and unemployed persons seeking part-time work. Persons with a job but not at work during the survey week are classified ac-
cording to whether they usually work full or part time.

Labor force time lost is a measure of man-hours lost to the economy through unemployment and involuntary part-time employment and is expressed as a percent of potentially available man-hours. It is computed by assuming: (1) that unemployed persons looking for full-time work lost an average of 37.5 hours, (2) that those looking for parttime work lost the average number of hours actually worked by voluntary part-time workers during the survey week, and (3) that persons on part time for economic reasons lost the difference between 37.5 hours and the actual number of hours they worked.

## ESTIMATING METHODS

Under the estimation methods used in the CPS, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. There are no subsequent adjustments to independent benchmark data on labor force, employment, or unemployment. Therefore, revisions of the historical data are not an inherent feature of this statistical program.

1. Noninterview adjustment. The weights for all interviewed households are adjusted to the extent needed to account for occupied sample households for which no information was obtained because of absence, impassable roads, refusals, or unavailability for other reasons. This adjustment is made separately by groups of sample areas and, within these, for six groups--color (white and nonwhite) within the three residence categories (urban, rural nonfarm, and rural farm). The proportion of sample households not interviewed varies from 4 to 6 percent depending on weather, vacations, etc.
2. Ratio estimates. The distribution of the population selected for the sample may differ somewhat, by chance, from that of the Nation as a whole, in such characteristics as age, color, sex, and residence. Since these population characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio estimates as follows:
a. First-stage ratio estimate. This is a procedure in which the sample proportions are weighted by the known 1960 Census data on the color-residence distribution of the population. This step takes into account the differences existing at the time of the 1960 Census between the color-residence distribution for the Nation and for the sample areas.
b. Second-stage ratio estimate. In this step, the sample proportions are weighted by independent current estimates of the population by age, sex, and color. These estimates are prepared by carrying forward the most recent census data (1960) to take account of subsequent aging of the population, mortality, and migra-
tion between the United States and other countries.
3. Composite estimate procedure. In deriving statistics for a given month, a composite estimating procedure is used which takes account of net changes from the previous month for continuing parts of the sample (75 percent) as well as the sample results for the current month. This procedure reduces the sampling variability of month-to-month changes especially and of the levels for most items also.

## Rounding of Estimates

The sums of individual items may not always equal the totals shown in the same tables because of independent rounding of totals and components to the nearest thousand. Differences, however, are insignificant.

## Reliability of the Estimates

Since the estimates are based on a sample, they may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures.

The standard error is a measure of sampling variability, that is, the variations that might occur by chance because only a sample of the population is surveyed. The chances are about 2 out of 3 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 19 out of 20 that the difference would be less than twice the standard error.

Table A shows the average standard error for the major employment status categories, by sex, computed from data for past months. Estimates of change derived from the survey are also subject to sampling variability. The standard error of change for consecutive months is also shown in table A. The standard errors of level shown in table A are acceptable approximations of the standard errors of year-to-year change.

The figures presented in table B are to be used for other characteristics and are approximations of the standard errors of all such characteristics. They should be interpreted as providing an indication of the order of magnitude of the standard errors rather than as the precise standard error for any specific item.

The standard error of the change in an item from one month to the next month is more closely related to the standard error of the monthly level for that item than to the size of the specific month-to-month change itself. Thus, in order to use the approximations to the standard errors of month-to-month changes as presented in table $C$, it is first necessary to obtain the standard error of the monthly level of the item in table B, and then find the standard error of the month-to-month change in table C corresponding to this standard error of level. It should

Table A. Average standard error of major employment status categories
(In thousands)

| Employment status <br> and sex | Average standard error of-- |  |
| :---: | :---: | :---: |

Table B. Standard error of level of monthly estimates
(In thousands)

| Size of estimate | Both sexes |  | Male |  | Female |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total or white | Nonwhite | Total or white | Nonwhite | $\begin{aligned} & \text { Total } \\ & \text { or } \\ & \text { white } \end{aligned}$ | Nonwhite |
| 10. | 4 | 4 | 6 | 4 | 6 | 4 |
| 50 | 9 | 9 | 11 | 9 | 11 | 9 |
| 100 | 12 | 12 | 16 | 12 | 16 | 12 |
| 250 | 20 | 17 | 25 | 17 | 25 | 17 |
| 500 | 30 | 25 | 34 | 25 | 34 | 25 |
| 1,000 | 40 | 35 | 50 | 35 | 50 | 35 |
| 2,500 .... | 60 | 40 | 75 | 40 | 75 | 40 |
| 5,000 . . . | 85 | 45 | 90 | ... | 90 | ... |
| 10,000 . . | 115 | ... | 115 | ... | 115 | $\ldots$ |
| 20,000 . . . | 150 | . $\cdot$ | 125 | ... | 125 | $\ldots$ |
| 30,000 . . . | 170 | ... | ... | $\cdots$ | ... | $\ldots$ |
| 40,000 . . . | 180 | ... | . $\cdot$ | $\ldots$ | ... | $\ldots$ |

be noted that table C applies to estimates of change between 2 consecutive months. For changes between the current month and the same month last year, the standard errors of level shown in table B are acceptable approximations.

Illustration: Assume that the tables showed the total number of persons working a specific number of hours as $15,000,000$, an increase of 500,000 over the previous month. Linear interpolation in the first column of table B shows that the standard error of $15,000,000$ is about 133,000. Consequently, the chances are about 68 out of 100 that the sample estimate differs by less than 133,000 from the figure which would have been obtained from a complete count of the number of persons working the given number of hours. Using the 133,000 as the standard error of the monthly level in table C , it may be seen that the standard error of the 500,000 increase is about 126,000.

Table C. Standard error of estimates of month-to-month change
(In thousands)

| Standard error of monthly level | Standard error of month-to-month change |
| :---: | :---: |
| 10.............................. | 12 |
| 25.............................. | 28 |
| 50.............................. | 55 |
| 100............................ | 100 |
| 150 ............................ | 140 |
| 200 ............................. | 155 |
| 250 ............................ | 160 |
| $300 . . . . . . . . . . . . . . . . . . . . . . . . . . . ~$ | 190 |

The reliability of an estimated percentage, compured by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Where the numerator is a subclass of the denominator, estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerator of the percentage, particularly if the percentage is large ( 50 percent or greater). Table D shows the standard errors for percentages derived from the survey. Linear interpolation may be used for percentages and base figures not shown in table $D$.

Table D. Standard error of percentage

| Base of percentages (thousands) | Estimated percentage |  |  |  |  |  |  |  |  |

## Establishment Data

## COLLECTION

Payroll reports provide current information on wage and salary employment, hours, earnings, and labor turnover in nonagricultural establishments, by industry and geographic location.

## Federal-State Cooperation

Under cooperative arrangements with State agencies, the respondent fills out a single employment or labor turnover reporting form, which is then used for national, State, and area estimates. This eliminates duplicate reporting on the part of respondents and, together with the use of identical techniques at the national and State levels, insures maximum comparability of estimates.

State agencies mail the forms to the establishments and examine the returns for consistency, accuracy, and completeness. The States use the information to prepare

State and area series and then send the establishment data to the BLS for use in preparing the national series.

## Shuttle Schedules

Two types of data collection schedules are used: Form BLS 790--Monthly Report on Employment, Payroll, and Hours; and Form DL 1219--Monthly Report on Job Openings and Labor Turnover. These schedules are of the "shuttle" type, with space for each month of the calendar year. The collecting agency returns the schedule to the respondent each month so that the next month's data can be entered. This procedure assures maximum comparability and accuracy of reporting, since the respondent can see the figures he has reported for previous months.

Form BLS 790 provides for entry of data on the number of full- and part-time workers on the payrolls of non-
agricultuiral establishments and, for most industries, payroll and man-hours of production and related workers or nonsupervisory workers for the pay period which includes the 12 th of the month. Form DL 1219 provides for the collection of information on the total number of accessions and separations, by type, during the calendar month, and was revised in January 1969 to provide for the collection of job openings data as well.

## CONCEPTS

Industrial Classification
Establishments reporting on Form BLS 790 and Form DL 1219 are classified into industries on the basis of their principal product or activity determined from information on annual sales volume. This information is collected each year on a supplement to the monthly 790 or 1219 report. For an establishment making more than one product or engaging in more than one activity, the entire employment of the establishment is included under the industry indicated by the most important product or activity.

All national, State, and area employment, hours, earnings, and labor turnover series are classified in accordance with the Standard Industrial Classification Manual, Bureau of the Budget, 1967.

## Industry Employment

Employment data, except those for the Federal Government, refer to persons on establishment payrolls who received pay for any part of the pay period which includes the 12 th of the month. For Federal Government establishments, employment figures represent the number of persons who occupied positions on the last day of the calendar month. Intermittent workers are counted if they performed any service during the month.

The data exclude proprietors, the self-employed, unpaid volunteer, or family workers, farm workers, and domestic workers in households. Salaried officers of corporations are included. Government employment covers only civilian employees; military personnel are excluded.

Persons on establishment payrolls who are on paid sick leave (when pay is received directly from the firm), on paid holiday or paid vacation, or who work during a part of the pay period and are unemployed or on strike during the rest of the period, are counted as employed. Not counted as employed are persons who are laid off, on leave without pay, or on strike for the entire period, or who are hired but have not reported to work during the period.

## Industry Hours and Earnings

Hours and earnings data are derived from reports of payrolls and man-hours for production and related workers in manufacturing and mining, construction workers in contract construction, and nonsupervisory employees in the remaining nonagricultural components. For Federal

Government, hours and earnings relate to all employees, both supervisory and nonsupervisory. Terms are defined below. When the pay period reported is longer than 1 week, figures are reduced to a weekly basis.

Production and related workers include working foremen and all nonsupervisory workers (including leadmen and trainees) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping, maintenance, repair, janitorial and watchman services, product development, auxiliary production for plant's own use (e.g., power plant), and recordkeeping and other services closely associated with the above production operations.

Construction workers include the following employees in the contract construction division: working foremen, journeymen, mechanics, apprentices, laborers, etc., whether working at the site of construction or in shops or yards, at jobs (such as precutting and preassembling) ordinarily performed by members of the construction trades.

Nonsupervisory employees include employees (not above the working supervisory level) such as office and clerical workers, repairmen, salespersons, operators, drivers, physicians, lawyers, accountants, nurses, social workers, research aids, teachers, draftsmen, photographers, beauticians, musicians, restaurant workers, custodial workers, attendants, linemen, laborers, janitors, watchmen, and similar occupational levels, and other employees whose services are closely associated with those of the employees listed.

Payroll covers the payroll for full- and part-time production, construction, or nonsupervisory workers who received pay for any part of the pay period which includes the 12 th of the month. The payroll is reported before deductions of any kind, e.g., for old-age and unemployment insurance, group insurance, withholding tax, bonds, or union dues; also included is pay for overtime, holidays, vacations, and sick leave paid directly by the firm. Bonuses (unless earned and paid regularly each pay period), other pay not earned in pay period reported (e.g., retroactive pay), tips, and the value of free rent, fuel, meals, or other payment in kind are excluded. "Fringe benefits" (such as health and other types of insurance, contributions to retirement, etc. paid by the employer) are also excluded.

Man-hours cover man-hours paid for, during the pay period which includes the 12 th of the month, for production, construction, or nonsupervisory workers. The manhours include hours paid for holidays and vacations, and for sick leave when pay is received directly from the firm.

Overtime hours cover hours worked by production or related workers for which overtime premiums were paid because the hours were in excess of the number of hours of either the straight-time workday or the workweek during the pay period which includes the 12 th of the month. Weekend and holiday hours are included only if overtime
premiums were paid. Hours for which only shift differential, hazard, incentive, or other similar types of premiums were paid are excluded.

## Gross Average Hourly and Weekly Earnings

Average hourly earnings are on a "gross" basis, reflecting not only changes in basic hourly and incentive wage rates but also such variable factors as premium pay for overtime and late-shift work and changes in output of workers paid on an incentive plan. Shifts in the volume of employment between relatively high-paid and low-paid work and changes in workers' earnings in individual establishments also affect the general earnings averages. Averages for groups and divisions further reflect changes in average hourly earnings for individual industries.

Averages of hourly earnings differ from wage rates. Earnings are the actual return to the worker for a stated period of time; rates are the amounts stipulated for a given unit of work or time. The earnings series does not measure the level of total labor costs on the part of the employer since the following are excluded: Irregular bonuses, retroactive items, payments of various welfare benefits, payroll taxes paid by employers, and earnings for those employees not covered under the pro-duction-worker, construction worker, or nonsupervisoryemployee definitions.

Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings. Therefore, weekly earnings are affected not only by changes in gross average hourly earnings but also by changes in the length of the workweek, part-time work, stoppages for varying causes, labor turnover, and absenteeism.

## Average Weekly Hours

The workweek information relates to the average hours for which pay was received and is different from standard or scheduled hours. Such factors as absenteeism, labor turnover, part-time work, and stoppages cause average weekly hours to be lower than scheduled hours of work for an establishment. Group averages further reflect changes in the workweek of component industries.

## Average Overtime Hours

The overtirne hours represent that portion of the gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid. If an employee worked on a paid holiday at regular rates, receiving as total compensation his holiday pay plus straight-time pay for hours worked that day, no overtime hours would be reported.

Since overtime hours are premium hours by definition, gross weekly hours and overtime hours do not necessarily move in the same direction from month-tomonth; for example, overtime premiums may be paidfor hours in excess of the straight-time workday although less than a full week is worked. Diverse trends at the in-dustry-group level also may be caused by a marked change
in gross hours for a component industry where little or no overtime was worked in both the previous and current months. In addition, such factors as stoppages, absenteeism, and labor turnover may not have the same influence on overtime hours as on gross hours.

## Hours and Earnings For Total Private Nonagricultural Industries

This series covers all nonagricultural industry divisions except government. The principal source of payroll data is Form BLS 790. Secondary source material such as Employment and Wages (Manpower Administration), County Business Patterns (Bureau of the Census), and additional supporting information such as The Hospital Guide, Part II, of the American Hospital Association and special studies by the National Council of Churches supplement data for certain industry groups within the service division.

For a technical description of this series, see the article, "Hours and Earnings for Workers in Private Nonagriculcural Industries," published in the May 1967 issue of Employment and Earnings and Monthly Report on the Labor Force.

## Railroad Hours and Earnings

The figures for class I railroads (excluding switching and terminal companies) are based on monthly data summarized in the M-300 report of the Interstate Commerce Commission and relate to all employees except executives, officials, and staff assistants (ICC group I) who received pay during the month. Gross average hourly earnings are computed by dividing total compensation by total hours paid for. Average weekly hours are obtained by dividing the total numberof hours paid for, reduced to a weekly basis, by the number of employees, as defined above. Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings.

## Spendable Average Weekly Earnings

Spendable average weekly earnings in current dollars are obtained by deducting estimated Federal social security and income taxes from gross weekly earnings. The amount of income tax liability depends on the number of dependents supported by the worker and his marital status, as well as on the level of his gross income. To reflect these variables, spendable earnings are computed for a worker with no dependents and a married worker with three dependents. The computations are based on gross average weekly earnings for all production or nonsupervisory workers in the industry division excluding other income and income earned by other family members.
"Real" earnings are computed by dividing the current Consumer Price Index into the earnings averages for the current month. The level of earnings is thus adjusted for changes in purchasing power since the base period (1957-59).

Average Hourly Earnings Excluding Overtime

Average hourly earnings excluding overtime premium pay are computed by dividing the total productionworker payroll for the industry group by the sum of total production-worker man-hours and one-half of total overtime man-hours. Prior to January 1956, these data were based on the application of adjustment factors to gross average hourly earnings (as described in the Monthly Labor Review, May 1950, pp. 537-540). Both methods eliminate only the earnings due to overtime paid for at $1 \frac{1}{2}$ times the straight-time rates. No adjustment is made for other premium payment provisions, such as holiday work, late-shift work, and overtime rates other than time and one-half.

## Indexes of Aggregate Weekly Payrolls and Man-Hours

The indexes of aggregate weekly payroils and manhours are prepared by dividing the current month's aggregate by the monthly average for the 1957-59 period. The man-hour aggregates are the product of average weekly hours and production-worker employment, and the payroll aggregates are the product of gross average weekly earnings and production-worker employment.

## Labor Turnover

Labor turnover is the gross movement of wage and salary workers into and out of employed status with respect to individual establishments. This movement, which relates to a calendar month, is divided into two broad types: Accessions (new hires and rehires) and separations (terminations of employment initiated by either employer or employee). Each type of action is cumulated for a calendar month and expressed as a rate per 100 employees. The data relate to all employees, whether full- or part-time, permanent or temporary, including executive, office, sales, other salaried personnel, and production workers. Transfers to another establishment of the company are included, beginning with January 1959.

Accessions are the total number of permanent and remporary additions to the employment roll, including both new and rehired employees.

New hires are temporary or permanent additions to the employment roll of persons who have never before been employed in the establishment (except employees transferring from another establishment of the same company) or of former employees not recalled by the employer.

Other accessions, which are not published separately but are included in total accessions, are all additions to the employment roll which are not classified as new hires, including transfers from another establishment of the company.

Separations are terminations of employment during the calendar month and are classified according to cause: Quits, layoffs, and other separations, are defined as follows:

Quits are terminations of employment initiated by employees, failure to report after being hired, and unauthorized absences, if on the last day of the month the person has been absent more than 7 consecutive calendar days.

Layoffs are suspensions without pay lasting or expected to last more than 7 consecutive calendar days, initiated by the employer without prejudice to the worker.

Other separations, which are not published separately but are included in total separations, are terminations of employment because of discharge, permanent disability, death, retirement, transfers to another establishment of the company, and entrance into the Armed Forces for a period expected to last more than 30 consecutive calendar days.

## Relationship to Employment Series

Month-to-month changes in total employment in manufacturing industries reflected by labor turnover rates are not comparable with the changes shown in the Bureau's employment series for the following reasons: (1) Accessions and separations are computed for the entirecalendar month; the employment reports refer to the pay jeriod which includes the 12th of the month; and (2) employees on strike are not counted as turnover actions although such employees are excluded from the employment estimates if the work stoppage extends through the report period.

## ESTIMATING METHODS

The principal features of the procedure used to estimate employment for the industry statistics are (1) the use of the "link relative" technique, which is a form of ratio estimation, (2) periodic adjustment of employment levels to new benchmarks, and (3) the use of size and regional stratification.

## The "Link Relative" Technique

From a sample composed of establishments reporting for both the previous and current months, the ratio of current month employment to that of the previous month is computed. This is called a link relative. The estimates of employment (all employees, including production and nonproduction workers together) for the current month are obtained by multiplying the estimates for the previous month by these 'link relatives. In addition, small bias correction factors are applied to selected employment estimates each month. The size of the bias correction factors is determined from past experience. Other features of the general procedures are described later in the table, Summary of Methods for Computing Industry Statistics on Employment, Hours, Earnings, and Labor Turnover. Further details are given in the technical notes on Measurement of Employment, Hours, and Earnings in Non-agricultural Industries and on Measurement of $L$ abor $T$ urnover, which are available upon request.

## Size and Regional Stratification

A number of industries are stratified by size of establishment and/or by region, and the stratified produc-
tion- or nonsupervisory-worker data are used to weight the hours and earnings into broader industry groupings. Accordingly, the basic estimating cell for an employment, hours, or earnings series, as the term is used in the summary of computational methods, may be a whole industry or a size stratum, a region stratum, or a size stratum of a region within an industry.

## Benchmark Adjustments

Employment estimates are compared periodically with comprehensive counts of employment which provide "benchmarks" for the various nonagricultural industries, and appropriate adjustments are made as indicated. The industry estimates are currently projected from March 1968 levels. Normally, benchmark adjustments are made annually.

The primary sources of benchmark information are employment data, by industry, compiled quarterly by State agencies from reports of establishments covered under State unemployment insurance laws. These tabulations, covering three-fourths of the total nonagricultural employment in the United States, are prepared under the direction of the Manpower Administration. Benchmark data for the residual are obtained from the records of the Social Security Administration, the Interstate Commerce Commission, and a number of other agencies in private industry or government.

The estimates relating to the benchmark month are compared with new benchmark levels, industry by industry. If revisions are necessary, the monthly series of estimates are adjusted between the new benchmark and the preceding one, and the new benchmark for each industry is then carried forward progressively to the current month by use of the sample trends. Thus, under this procedure, the benchmark is used to establish the level of employment; the sample is used to measure the month-to-month changes in the level. A comparison of the actual amounts of revisions made in the last 3 benchmark years follows:

Nonagricultural payroll employment estimates, by industry division, as a percentage of the benchmark for 1966-1968

| Industry division | 1966 | 1967 | 1968 |
| :---: | ---: | ---: | ---: |
| Total . . . . . . . . . . . . . . . . | 99.9 | 100.0 | 100.4 |
| Mining . . . . . . . . . . . | 100.5 | 99.5 | 101.7 |
| Contract construction . . . . . | 99.7 | 101.6 | 99.5 |
| Manufacturing . . . . . . . . | 99.4 | 99.5 | 99.8 |
| Transportation and public |  |  |  |
| utilities . . . . . . . . . . | 99.7 | 99.8 | 100.7 |
| Wholesale and retail trade . . . | 100.1 | 100.7 | 100.3 |
| Finance, insurance, and |  |  |  |
| real estate . . . . . . . . . . | 99.5 | 100.2 | 99.2 |
| Services . . . . . . . . . . . | 100.3 | 99.8 | 99.2 |
| Government. . . . . . . . . | 100.0 | 100.0 | 102.8 |

Data for all months since the last benchmark to which the series has been adjusted are subject to revision. To provide users of the data with a convenient reference source for the revised data, the BLS publishes as soon as possible after each benchmark revision a summary volume of employment, hours, earnings, and labor turnover statistics.

## THE SAMPLE

## Design

The sampling plan used in the current employment statistics program is known as "sampling proportionate to average size of establishment." This design is an optimum allocation design among strata since the sampling variance is proportional to the average size of establishments. The universe of establishments is stratified first by industry and then within each industry by size of establishment in terms of employment. For each industry, the number of sample units is distributed among the size class cells on the basis of average employment per establishment in each cell. In practice, this is equivalent to distributing the predetermined total number of establishments required in the sample among the cells on the basis of the ratio of employment in each cell to total employment in the industry. Within each noncertainty stratum the sample members are selected at random.

Under this type of design, large establishments fall into the sample with certainty. The size of the samples for the various industries is determined empirically on the basis of experience and of cost considerations. In a manufacturing industry in which a high proportion of total employment is concentrated in relatively few establishments, a large percentage of total employment is included in the sample. Consequently, the sample design for such industries provides for a complete census of the larger establishments with only a few chosen from among the smaller establishments or none at all if the concentration of employment is great enough. On the other hand, in an industry in which a large proportion of total employment is in small establishments, the sample design calls for inclusion of all large establishments and also for a substantial number of the smaller ones, Many industries in the trade and service divisions fall into this category. To keep the sample to a size which can be handled by available resources, it is necessary to accept samples in these divisions with a smaller proportion of universe employment than is the case for most manufacturing industries. Since individual establishments in these nonmanufacturing divisions generally show less fluctuation from regular cyclical or seasonal patterns than establishments in manufacturing industries, these smaller samples (in terms of employment) generally produce reliable estimates.

In the context of the BLS employment and labor turnover statistics programs, with their emphasis on pro-
ducing timely data at minimum cost, a sample must be obtained which will provide coverage of a sufficiently large segment of the universe to provide reasonably reliable estimates that can be published promptly and regularly. The present sample meets these specifications for most industries. With its use, the BLS is able to produce preliminary estimates each month for many industries and for many geographic levels within a few weeks after reports are malled by respondents, and at a somewhat later date, statistics in considerably greater industrial detail.

## Coverage

The BLS sample of establishment employment and payrolls is the largest monthly sampling operation in the field of social statistics. The table that follows shows the approximate proportion of total employment in each industry division covered by the group of establishments furnishing monthly employment data. The coverage for individual industries within the division may vary from the proportions shown.

Approximate size and coverage of BLS employment and payrolls sample, March $1968^{1}$

| Industry division | Number of establishments in sample | Employees |  |
| :---: | :---: | :---: | :---: |
|  |  | Number reported | Per- <br> cent <br> of <br> total |
| Mining | 2,200 | 274,000 | 47 |
| Contract construction | 16,200 | 772,000 | 26 |
| Manufacturing | 46,100 | 12,422,000 | 64 |
| Transportation and public utilities: |  |  |  |
| Railroad transportation (ICC) . . . . . . . . . . . . . | 100 | 636,000 | 96 |
| Other transportation and public utilities. . . . . . . | 7,100 | 2,042,000 | 57 |
| Wholesale and retail trade. | 39,700 | 2,815,000 | 21 |
| Finance, insurance and real estate. . . . . . . . . . . | 9,400 | 1,239,000 | 37 |
| Services. | 22,400 | 2,227,000 | 21 |
| Government: |  |  |  |
| Federal (Civil Service Commission) ${ }^{2}$. . . . . | 3,200 | 2,699,000 | 100 |
| State and local | 9,400 | 4,907,000 | 54 |

${ }^{1}$ Since a few establishments do not report payroll and man-hour information, hours and earnings estimates may be based on a slightly smaller sample than employment estimates.
${ }^{2}$ State and area estimates of Federal employment are based on reports from a sample of Federal establishments, collected through the BLS-State cooperative program.

The table below shows the approximate coverage, in terms of employment, of the labor turnover sample.

Approximate size and coverage of BLS labor turnover sample, March 1968

| Industry | Employees |  |
| :---: | ---: | :---: |
|  | Number <br> reported | Percent <br> of total |
| Manufacturing . . . . . . | $11,060,000$ | 57 |
| Metal mining. . . . . . | 49,100 | 74 |
| Coal mining. . . . . . | 59,800 | 44 |
| Communication: | . . . | 632,400 |
| Telephone . . . . . . | 78 |  |
| Telegraph . . . . | 22,400 | 69 |

## Reliability of the Employment Estimates

The estimates derived from the establishment survey may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures. The relatively large size of the BLS establishment sample assures a high degree of accuracy. However, since the link relative technique requires the use of the previous month's estimate as the base in computing the current month's estimate, small sampling and response errors may cumulate over several months. To remove this accumulated error, the estimates are adjusted annually to new benchmarks. In addition to the sampling and response errors, the benchmark revision adjusts the estimates for changes in the industrial classification of individual establishments (resulting from changes in their product which are not reflected in the levels of estimates until the data are adjusted to new benchmarks). In fact, at the more detailed industry levels, particularly within manufacturing, changes in classification are the major cause of benchmark adjustments. Another cause of differences, generally minor, arises from improvements in the quality of the benchmark data. (A detailed description of the March 1968 benchmark is available from the Bureau upon request.)

One measure of the reliability of ratio estimates is the root mean square error (RMSE). This measure is the standard deviation adjusted for the bias in ratio estimates (RMSE $=\sqrt{\left(\text { Standard Deviation) }{ }^{2}+(\text { Bias })^{2}\right)}$. If the bias is small, the chances are about 2 out of 3 that an estimate from the sample would differ from its benchmark by less than the roor mean square error. The chances are about 19 out of 20 that the difference would be less than twice the root mean square error.

Approximations of the root mean square errors (based on the experience of the last several years) of differences between final estimates and benchmarks are presented in the following table.

| Root-mean-square errors of differences <br> between benchmarks and estimates |  |
| :---: | :---: |
| Size of employment <br> estimate | Root-mean-square <br> error |
| 50,000 | 2,000 |
| 100,000 | 2,600 |
| 200,000 | 3,600 |
| 500,000 | 7,000 |
| $1,000,000$ | 11,600 |
| $2,000,000$ | 18,400 |

${ }^{1}$ Assuming 12 -month intervals between benchmark revisions.

For the most recent months, estimates of employment, hours, and earnings are preliminary and are so footnoted in the tables. These figures are based on less than the total sample and are revised when all the reports in the sample have been received. The table below presents root-mean-square-errors of the amounts of

Errors of preliminary employment estimates

| Size of empl. <br> estimate | Root-mean-square error of |  |
| :---: | :---: | :---: |
|  | Monthly level | Month-to-month <br> change |
| 50,000 | 600 | 600 |
| 100,000 | 900 | 900 |
| 200,000 | 1,700 | 1,700 |
| 500,000 | 3,000 | 2,800 |
| $1,000,000$ | 4,300 | 4,000 |
| $2,000,000$ | 8,000 | 8,000 |
| $10,000,000$ | 29,600 | 27,600 |
| Total Nonag. empl. | 84,000 | 74,000 |

revision that may be expected between the preliminary and final levels of employment and preliminary and final month-to-month changes. Revisions of preliminary hours and earnings estimates are normally not greater than . 1 of an hour for weekly hours or 1 cent for hourly earnings.

## STATISTICS FOR STATES AND AREAS

State and area employment, hours, earnings, and labor turnover data are collected and prepared by State agencies in cooperation with BLS. The area statistics relate to-metropolitan areas. Definitions for all areas are published each year in the issue of Employment and Earnings that contains State and area annual averages (usually the May issue). Changes in definitions are noted as they occur. Additional industry detail may be obtained from the State agencies listed on the inside back cover of each issue. These statistics are based on the same establishment reports used by BLS for preparing national estimates. For employment, the sum of the State figures may differ slightly from the equivalent official U.S. totals on a national basis, because some States have more recent benchmarks than others and because of the effects of differing industrial and geographic stratification.

For the States and the areas shown in the B and C sections of this periodical, all the annual average data for the detailed industry statistics currently published by each cooperating State agency are presented (from the earliest date of availability of each series) in a summary volume published annually by the BLS.

## UNEMPLOYMENT INSURANCE DATA

Insured unemployment represents the number of persons reporting a week of unemployment under an unemployment insurance program. It includes some persons who are working part time who would be counted as employed in the payroll and household surveys. Excluded are persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (agriculture, State and local government, domestic service, self-employment, unpaid family work, nonprofit organizations, and firms below a minimum size). The rate of insured unemployment is the number of insured unemployed expressed as a percent of average covered employment in a 12 -month periodending 6 to 8 months prior to the week of reference. Initial
claims are notices filed by those losing jobs covered by an unemployment insurance program that they are starting a period of unemployment. A claimant who continues to be unemployed a full week is then counted in the insured unemployment figure.

Because of differences in State laws and procedures under which unemployment insurance programs are operated, State unemployment rates generally indicate, but do not precisely measure, differences among the individual States. Persons wishing to receive a detailed description of the nature, sources, inclusions and exclusions, and limitations of unemployment insurance data should address their inquiries to Manpower Administration, Washington, D.C.

## SEASONAL ADJUSTMENT

Many economic statistics reflect a regularly recurring seasonal movement which can be estimated on the basis of past experience. By eliminating that part of the change which can be ascribed to usual seasonal variation, it is possible to observe the cyclical and other nonseasonal movements in the series. However, in evaluating deviations from the seasonal pattern--that is, changes in a seasonally adjusted series--it is important to note that seasonal adjustment is merely an approximation based on past experience. Seasonally adjusted estimates have a broader margin of possible error than the original data on which they are based, since they are subject not only to sampling and other errors but, in addition, are affected by the uncertainties of the seasonal adjustment process itself. Seasonally adjusted series for selected labor force and establishment data are published regularly in. Employment and Earnings.

The seasonal adjustment method used for these series is an adaptation of the standard ratio-to-moving average method, with a provision for "moving"adjustment factors to take account of changing seasonal patterns. A detailed description of the method is given in the booklet, The BLS Seasonal Factor Method (1966), which may be obtained from the Bureau on request.

For establishment data, the seasonally adjusted series on weekly hours and labor turnover rates for industry groupings are compured by applying factors directly to the corresponding unadjusted series. However, seasonally adjusted employment totals for all employees and production workers by industry division are obtained by summing seasonally adjusted data for the component industries. Indexes of aggregate weekly man-hours, seasonally adjusted, for mining, contract construction, and the major industries in manufacturing are obtained by multiplying average weekly hours, seasonally adjusted, by production workers, seasonally adjusted, and dividing by the 1957-59 base. For total, manufacturing, and durable and nondurable goods, the indexes of aggregate weekly man-hours, seasonally adjusted, are obtained by summing the aggregate weekly man-hours, seasonally adjusted, for the appropriate component industries and dividing by the 1957-59 base.

The seasonally adjusted establishment data for Federal Government are based on a series which excludes the Christmas temporary help employed by the Post Office Department in December. The employment of these workers constitutes the only significant seasonal change in Federal Government employment during the winter months. Furthermore, the volume of such employment may change substantially from year to year because of administrative decisions by the Post Office Department. Hence, it was considered desirable to exclude this group from the data upon which the seasonally adjusted series is based. Factors currently in use for the establishment data are shown in the July 1969 Employment and Earnings, and revisions will be made coincidental with the adjustment of series to new benchmark levels.

For each of the three major labor force components-agricultural and nonagricultural employment and unem-ployment--data for four age-sex groups (male and female workers under age 20 and age 20 and over) are separately adjusted for seasonal variation and are then added to give seasonally adjusted total figures. In order to produce seasonally adjusted total employment and civilian labor force data, the appropriate series are aggregated. The seasonally adjusted rate of unemployment is derived by dividing the seasonally adjusted figure for total unemployment (the sum of four seasonally adjusted age-sex components) by the figure for the seasonally adjusted civilian labor force the sum of twelve seasonally adjusted age-sex components).

The seasonal adjustment factors applying to current data are based on a pattern shown by past experience. These factors are revised in the light of the pattern revealed by subsequent data. Revised seasonally adjusted series for major components of the labor force based on data through December 1968 are published in the February 1969 Employment and Earnings and Monthly Report on the LaborForce. Revisions will be made annually as each additional year's data become available.

## ATTENTION

As discuspsed in the Technical Note, the Bureau periodically adjusts the industry employment series to a recent benchmark to improve their accuracy. These adjustments may also affect the hours and earnings series because employment levels are used as weights. Industry data for all national series shownin this report have been adjusted to March 1968 benchmarks. Data from April 1968 forward are subject to revision at the time of the next benchmark.

Beginning with the July 1969 and subsequent issues of Employment and Earnings, the national data in sections B, C, and D supersede those publishedin previousissues, as well as those appearing in the Handbook of Labor Statistics, 1969. Comparable data will be published in Employment and Earnings, United States, 190 9-69, BLS Bulletin 1312-7.
on Employment, Hours, Earnings, and Lnhor Turnover

| Item | Basic estimating cells (industry, region, size, or region/size cell) | Aggregate industry levels (divisions, groups and, where stratified, individual cells) |
| :---: | :---: | :---: |
|  | Monthly Data |  |
| All employees | All-employee estimate for previous month multiplied by ratio of all employees in current month to all employees in previous month, for sample establishments which reported for both months. | Sum of all-employee estimates for component cells. |
| Production or nonsupervisory workers; women employees. | All-employee estimate for current month multi plied by (1) ratio of production or nonsupervisory workers to all employees in sample establishments for current month, (2) ratio of women to all employees. | Sum of production- or nonsupervisory-worker estimates, or estimates of women employees, for component cells. |
| Gross average weekly hours | Production- or nonsupervisory-worker man-hours divided by number of production or nonsupervisory workers. | Average, weighted by production- or nonsuper-visory-worker employment, of the average weekly hours for component cells. |
| Average weekly overtime hours | Production-worker overtime man-hours divided by number of production workers. | A verage, weighted by production-worker employment, of the average weekly overtime hours for component cells. |
| Gross average hourly earnings . . | Total production- or nonsupervisory-worker payroll divided by total production- or nonsuper-visory-worker man-hours. | Average, weighted by aggregate man-hours, of the average hourly earnings for component cells. |
| Gross average weekly earnings . . | Product of gross average weekly hours and average hourly earnings. | Product of gross average weekly hours and average hourly earnings. |
| Labor turnover rates . | The number of particular actions (e.g., quits) in reporting firms divided by total employment in those firms. The result is multiplied by 100. | Average, weighted by employment, of the rates for component cells. |
|  | Annual Average Dafa |  |
| All employees and production or nonsupervisory workers. | Sum of monthly estimates divided by 12. | Sum of monthly estimates divided by 12. |
| Gross average weekly hours | Annual total of aggregate man-hours (productionor nonsupervisory-worker employment multiplied by average weekly hours) divided by annual sum of employment. | Annual total of aggregate man-hours for production or nonsupervisory workers divided by annual sum of employment for these workers. |
| Average weekly overtime hours. . | Annual total of aggregate overtime man-hours (production-worker emp'oyment multiplied by average weekly overtime hours) divided by annual sum of employment. | Anaual total of aggregate overtime man-hours for producrion workers divided by annual sum of employment for these workers. |
| Gross average hourly earnings . | Annual total of aggregate payrolls (productionor nonsupervisory-worker employment multiplied by weekly earnings) divided by annual aggregate man-hours. | Annual total of aggregate payrolls divided by annual aggregate man-hours. |
| Gross average weekly earnings . . | Product of gross average weekly hours and average hourly earnings. | Product of gross average weekly hours and average hourly earnings. |
| Labor turnover rates. . | Sum of monthly rates divided by 12. | Sum of monthly rates divided by 12. |
