

EMPLOYMENT AND EARNINGS
January 1985
U.S. Department of Labor

Bureau of Labor Statistics

In this issue:
1984 annual averages
Revised seasonally adjusted labor force series
Data on union affiliation

Digitized for FRASER

## U.S. DEPARTMENT OF LABOR <br> Raymond J. Donovan, Secretary

BUREAU OF L.ABOR STATISTICS
Janet I.. Norwood, Commissioner

Employment and Earnings is prepared by the Division of Data Development and Users' Services and the Division of Monthly Industry Employment Statistics in collaboration with the Division of Special Publications. The data are collected by the Bureau of the Census (Department of Commerce) and State employment security agencies, in cooperation with the Bureau of I abor Statistics. A brief description of the cooperative statistical programs of the BLS with these agencies is presented in the Explanatory Notes. The State agencies are listed on the inside back corer.

Emplovment and Earnings may be ordered through the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Subscription price per year $\$ 31$ domestic and $\$ 38.75$ foreign. Single copy $\$ 4.50$ domestic and $\$ 5.63$ foreign. Annual supplement $\$ 8$ domestic and $\$ 10$ foreign. Prices are subject to change by the U.S. Government Printing Office. For ordering information call (202) 783-3238.

Communications on material in this publication should be addressed to: Editors, Employment and Earnings, Bureau of Labor Statistics, Washington, D.C. 20212, or phone: Gloria P. Green (202) 523-1821. Send correspondence on circulation and subscription matters (inciuding address changes) to the Superintendent of Documents.

The Secretary of Labor has determined that publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through July 1, 1985. Second-class postage paid at W'ashington, D.C. and at additional mailing addresses.

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission.

ISSN 0013-6840

## Calendar of Features

In addition to the monthly data appearing regularly in Employment and Earnings special features appear in most of the issucs as shown below:

## Household data

| Annual averages <br> Union affiliation | Jan. |
| :--- | ---: |
| Jan. |  |
| Revised seasonally adjusted serics | Jan., Feb. |
| Quarterly averages: Seasonally adjusted <br> data, persons not in labor force, persons <br> of Hispanic origin, Vietnam-era veterans <br> and nonveterans, family relationship data, <br> weekly earnings data | Jan., Apr., |

## Establishment data

National annual averages:
Industry divisions (preliminary) Jan.
Industry detail (final) Mar.

Women employees (final) Mar.
National data revised to reflect new benchmarks and June ${ }^{1}$ new seasonal factors

Revised historical national data
Supplement ${ }^{2}$
State and area annual averages May
Area definitions May
State and area labor force data

Annual averages
May
${ }^{1}$ Issue varies. Latest revised data introduced June 1984.
${ }^{2}$ Month of publication varies. The latest supplement was published in July 1984.

# Employment and Earnings 

Vol. 32 No. 1 January 1985
Editors: Gloria Peterson Green, Rosalie K. Epstein

## Editors' note

It is the annual practice of the Bureau of Labor Statistics to recalculate the seasonal adjustment factors for unemployment and other labor force series derived from the Current Population Survey (household survey) to incorporate the experience in the most recent year. As a result of the recalculation of seasonal adjustment factors, seasonally adjusted data for the past 5 years are subject to revision. The data in tables A-1, 2, 3, and 31-52 have been revised to reflect the updated seasonal adjustment factors. Revised monthly and quarterly data covering the 1980-84 revision period for a broader range of labor force series will appear in next month's issue.
The seasonal adjustment methodolgy is described in the article beginning on page 9 in this issue. The article also gives the new seasonal adjustment factors to be used to calculate the civilian labor force and other major series for January-June 1985.

# Employment and Unemployment Developments, December 1984 

Employment continued to rise in December and unemployment was little changed. The overall unemployment rate was 7.1 percent, little different from the 7.0 percent in November. The rate for civilian workers, at 7.2 percent, was about the same as November's 7.1 percent (as revised). Each measure has declined by a full percentage point from a year earlier.

Civilian employment-as measured by the monthly survey of households-rose by 340,000 to a level of 106.3 million. The number of nonagricultural payroll jobs-as measured by the monthly survey of establishments-was up by 310,000 to 95.8 million. Each employment series rose sharply in 1984 and has advanced by more than 7.1 million since the November 1982 recession trough.

## Unemployment

The number of unemployed persons and the civilian worker unemployment rate were both about unchanged in December. A total of 8.2 million persons were unemployed, 1 million fewer than a year earlier. Most of the decline occurred early in the year, but there was also some improvement in the final quarter. (See table A-33.)

Jobless rates among most major worker groups-including adult men ( 6.3 percent), adult women ( 6.4 percent), whites ( 6.2 percent), blacks ( 15.0 percent), and Hispanics ( 10.2 percent)-were essentially unchanged over the month. The jobless rate for teenagers edged up to 18.8 percent in December, about the same as in October. (See tables A-33 and A-34.)

The average duration of unemployment was about unchanged in December but was down markedly over the past year. Virtually all of the 1 million decline in unemployment from December 1983 took place among those out of work for 15 weeks or longer. (See table A-40.)

The number of job losers was unchanged over the month but was down about 850,000 over the year. Job losers accounted for about 50 percent of the total unemployed in December, compared with 58 percent in December 1983. (See table A-41.)

## Civilian employment and the labor force

Civilian employment rose by 340,000 to 106.3 million in December, after seasonal adjustment. Most of the
over-the-month gain occurred among adult women. Over the past year, civilian employment has risen by 3.2 million; this increase was shared equally by adult men and women. The proportion of the civilian population with jobs-the employment-population ratio-continued to edge upward and, at 59.9 percent in December, was up by 1.1 percentage points during 1984. (See table A-33.)

The civilian labor force expanded by nearly 400,000 in December to 114.5 million. Over the year, the labor force grew by about 2.2 million, and the proportion of the civilian working-age population in the labor force-the labor force participation rate-was 64.6 percent, one-half point above the year-earlier figure. As with the employed, all of the labor force growth for the year took place among adult workers. Teenagers continued to decline, reflecting reductions in their population.

## Discouraged workers

At 1.3 million in the fourth quarter, the number of discouraged workers-persons who report that they want to work but are not looking for jobs because they believe they cannot find any-edged up slightly from the third quarter level. Their number had been trending downward over the past 2 years from the recession high of 1.8 million reached in the fourth quarter of 1982. All of the recent increase occurred among blacks, who continue to comprise a high proportion of the discouraged total. (See table A-53.)

## Industry payroll employment

Total nonagricultural payroll employment, at 95.8 million, was up by 310,000 in December, seasonally adjused. Employment growth was widespread, with twothirds of the industries in the blS diffusion index registering over-the-month increases. (See tables B-4 and B-7.)

Manufacturing employment rose by 85,000 to 19.8 million. The biggest gain took place in transportation equipment $(30,000)$, mostly due to growth in motor vehicles and equipment. Of the 1.4 million increase in durable goods during the current recovery, 1 out of 5 has been in autos, though employment in the industry was still 150,000 below the 1979 record levels. Moderate December employment gains were also registered, after
seasonal adjustment, in the food processing, apparel, fabricated metals, and stone, clay, and glass products industries.

Construction employment fell less than seasonally expected in December, partly because of unusually good weather and, after seasonal adjustment, registered a gain of 55,000 . Since the March 1983 low, construction jobs have risen by 655,000 .

In the service-producing sector, the services industry continued its rapid job growth, expanding by 95,000 . There were also employment gains in wholesale trade $(30,000)$ and finance, insurance, and real estate $(20,000)$. Retail trade employment rose in line with the usual December expansion and was about unchanged after seasonal adjustment. There was also little over-the-month change in government and transportation and public utilities.

## Weekly Hours

The average workweek of production or nonsupervisory workers on private nonagricultural payrolls edged up 0.1 hour in December to 35.3 hours. Weekly hours in manufacturing rose by 0.2 hour to a relatively high level of 40.7 hours. Factory overtime was unchanged at 3.4 hours. (See table C-5.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonagricultural
payrolls was up 0.4 percent in December to 114.5 $(1977=100)$. The manufacturing index increased by 1.1 percent to 97.0 and was up by $31 / 2$ percent over the year. (See table C-6.)

## Hourly and weekly earnings

Average hourly earnings rose 0.7 percent in December, and weekly earnings were up 1 percent, seasonally adjusted. Prior to seasonal adjustment, average hourly earnings increased 4 cents to $\$ 8.47$, and average weekly earnings were up $\$ 4.80$ to $\$ 300.69$. Over the past year, hourly earnings have risen 31 cents and weekly earnings $\$ 11.01$. (See tables $\mathrm{C}-1$ and $\mathrm{C}-7$.)

## The Hourly Earnings Index

The Hourly Earnings Index (HEI) was 163.0 ( $1977=100$ ) in December, seasonally adjusted, an increase of 0.6 percent from November. For the 12 months ended in December, the increase (before seasonal adjustment) was 3.4 percent. The HEI excudes the effects of two types of changes unrelated to underlying wage rate movements-fluctuations in overtime in manufacturing and interindustry employment shifts. In dollars of constant purchasing power, the HEI decreased 0.4 percent during the 12 -month period ended in November. (See table C-7.)

# Revision of Seasonally <br> Adjusted Labor Force Series 

*Robert J. McIntire

As pointed out in the explanatory note on seasonal adjustment published at the back of each issue of Employment and Earnings, the purpose of seasonal adjustment is to eliminate from economic time series the influence of seasonal events such as weather, holidays, opening and closing of schools, etc., to make it easier to observe and analyze the cyclical and other nonseasonal movements in the series. The seasonality which the adjustment process endeavors to eliminate is measured by seasonal factors. The seasonal factors used for current adjustment are estimates of how much the original unadjusted values can be expected to deviate from underlying trend-cycle levels due to annually recurring behavior as projected from average seasonal patterns in the recent past. However, even though seasonality involves regularly recurring patterns, it does tend to change over time, creating a need for periodic reestimation of factors and revision of recently adjusted estimates. By including more recent data in the estimation process, the revision process can provide better estimates of how much the original, unadjusted estimates actually deviated from underlying trend-cycle levels during the recent period, thereby improving the historical seasonally adjusted data for that period. In addition, the new information is incorporated to produce the new projected factors to be used for current seasonal adjustment.

Therefore, at the end of each calendar year, the Bureau of Labor Statistics reestimates the seasonality of the unemployment, employment, and other labor force series derived from the Current Population Survey by including another full year of data in the estimation process. Based on this annual reestimation, blS issues the projected factors for the first 6 months of the new year as well as revised estimates of historical seasonally adjusted data for the last 5 years. Each year's data are generally subject to five revision cycles before the values are considered final. This year's revisions incorporate data through December 1984 and provide revised estimates for January 1980 through December 1984.

Revised data for many of the major seasonally adjusted labor force series were published in the news release on the December 1984 employment situation, issued January 9 (USDL 85-10). Data for recent months and quarters for many more of the revised series appear in this issue of Employment and Earnings. In addition,

[^0]this article provides the projected seasonal factors for the first 6 months of 1985 for the 12 component series used in the computation of the seasonally adjusted civilian labor force and unemployment rate (see table 3). Projected factors for the last 6 months of 1985 will be estimated in early July, based on data through June 1985, and will be published in the July issue of this publication. Next month's issue will contain the 1980-84 revisions for a few hundred of the seasonally adjusted labor force series most in demand. These revisions replace the data published in the February 1984 issue for 1980-83 and the seasonally adjusted estimates for 1984 published during the past year. (Seasonally adjusted data for 1979 and earlier years were not revised.)

## Effect of revisions

One of the criteria used to evaluate alternative methods of seasonal adjustment is how close initial estimates are to later revisions. Policymakers and analysts must make determinations based on current information, and so it is important that the initial estimates of current factors for the seasonal adjustment of major economic series produce estimates of level and change that are as close as possible to the improved estimates that will be made after more data have become available. Even though the revisions currently being released for the 1984 seasonally adjusted data are not final, the first revisions are usually the most substantial of the five that will be made and generally indicate the direction any subsequent revisions will take. Therefore, it is appropriate to compare the initial estimates with these first revisions. Based on such a comparison for the overall and civilian worker unemployment rates, the Bureau's official method for seasonal adjustment of the labor force series performed quite well in 1984. Table 1 shows these rates as first computed and as revised, as well as the change due to revision. The civilian rate to one decimal place was unchanged by the revisions in 8 of the 11 months subject to revision. (December is excluded since estimates based on projected factors were not published). The overall rate was unchanged in 7 of the 11 months. The absolute effect on the revisions never exceeded 0.1 for either of the rates.

## Adjustment methods and procedures

Through most of the 1970's, the Census Bureau's X-11 method ${ }^{1}$ was used for seasonal adjustment of

[^1]Table 1. Seasonally adjusted unemployment rates in 1984 and change due to revision

| Month | As first computed |  | As revised |  | Change due to revision |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Overall | Civilian | Overall | Civilian | Overall | Civilian |
| January | 7.9 | 8.0 | 7.9 | 8.0 | 0 | 0 |
| February | 7.7 | 7.8 | 7.7 | 7.8 | 0 | 0 |
| March | 7.7 | 7.8 | 7.7 | 7.8 | 0 | 0 |

| December | 7.1 | 7.2 | 7.1 | 7.2 | 0 | 0 |

labor force series. At the end of 1979, the X-11 ARIMA procedure, ${ }^{2}$ developed by Statistics Canada as an extension of the X-11 method, was adopted as the official seasonal adjustment procedure. The switch was made after extensive tests had shown that initial seasonally adjusted estimates were, on average, better (closer to later revisions) with the X-11 arima than with the X-11 alone. Its use for seasonal adjustment of labor force data at blS was also consistent with the recommendations of the National Commission on Employment and Unemployment Statistics. ${ }^{3}$

The X-11 arima method improves current estimates by allowing recent observations, especially the last 6 months, to weigh more heavily in the estimates of current and recent seasonal factors than did the X-11 alone. The method provides this improvement through the use of ARIMA models to extend the data series by 12 months. The X-11 algorithm for seasonal adjustment is then applied to the extended series.

Arima projections are based only on the past experience observed in a series itself. ARIMA models have proved to have good properties for short-term projection or extrapolation of a large class of time series, especially in a seasonal adjustment context, since the extrapolations tend to track intra-year movements quite well. The arima models in the X-11 Arima program used to seasonally adjust the labor force series are of the Box-Jenkins type. ${ }^{4}$ They can generally be described with the notation:

[^2](p,d,q) (P,D,Q) TRANSFORMATION,
Where:
(1) $p$ is the number of regular (nonseasonal) autoregressive parameters
(2) $d$ is the number of regular differences
(3) q is the number of regular moving average parameters
(4) P is the number of seasonal autoregressive parameters
(5) D is the number of seasonal differences
(6) $Q$ is the number of seasonal moving average parameters
(7) TRANSFORMATION may be NONE,LOG, or POWER(n).

While the lettered elements within the parentheses of the model specifications can theoretically take on many values, in practice only small values are useful.

For each labor force series which has been extended based on an ARIMA model, the model has been specifically chosen as well suited to the particular series, based on a set of established criteria. The criteria essentially require a model to: (1) fit the series well, (2) have low average forecasting errors in the last 3 years prior to the projected year, and (3) produce residuals (the differences between the observed values and the values forecast by the model for the observed period) which follow a random pattern. Acceptable arima models have been identified and were used for 155 of the 195 labor force series which were directly adjusted at the end of 1984 , including all 12 major civilian labor force components, whose ARIMA models are shown in table 2. The 40 remaining series for which acceptable models have not been identified were simply run through the X-11 part of the program without any ARIMA extrapolations.

The procedures used for adjusting the labor force series within the $\mathrm{X}-11$ part of the process were the same as those followed last year. In keeping with the minor

Table 2. ARIMA models for the 12 major civilian labor force components, 1985

| Series | Model | Transformation |
| :---: | :---: | :---: |
| Agricultural employment: |  |  |
| Men. 20 years and over | $(0,1,4)(0,1.1)$ | NONE |
| Women, 20 years and over | $(0,1,2)(0.1,1)$ | LOG |
| Men, 16 to 19 years | $(0,1,2)(0,1,1)$ | NONE |
| Women, 16 to 19 years | (2.0.1) (0.1.1) | NONE |
| Nonagricultural employment: |  |  |
| Men, 20 years and over | $(0,1,1)(0.1,1)$ | LOG |
| Women, 20 years and over | (0.1.1) (0.1.1) | LOG |
| Men, 16 to 19 years | $(0.1,1)(0.1,1)$ | NONE |
| Women, 16 to 19 years | $(0,1,1)(0.1,1)$ | NONE |
| Unemployment: |  |  |
| Men, 20 years and over | $(2.1 .2)(0.1 .1)$ | NONE |
| Women, 20 years and over | $(2.1 .2)(0.1 .1)$ | LOG |
| Men, 16 to 19 years | $(0.1 .1)(0.1 .1)$ | NONE |
| Women, 16 to 19 years | $(0.1 .4)(0.1,1)$ | NONE |

change initiated during the last year's revision, a 10-year time period, including data from January 1975 through December 1984, was used for the adjustment of all the labor force series.

The X-11 method of seasonal adjustment contained in the $\mathrm{X}-11$ arima procedure assumes that the original series, including the 12 extrapolated observations if an ARIMA model has been applied, is either the product or the sum of three components- trend-cycle, seasonal, and irregular. The method uses either a ratio-to- or difference-from-moving-average approach to estimate the components, depending on whether the multiplicative or additive model is used. The seasonally adjusted series values are computed by dividing each month's original value by the corresponding seasonal factor if the multiplicative model is used, or by subtracting the factor if the additive model is used. Of the 12 major civilian labor force components, the four teenage unemployment and nonagricultural employment series were adjusted using the additive model, and the other eight series with the multiplicative model. Of all the 195 directly adjusted series, 37 were adjusted with the additive model, primarily those involving teenage employment and unemployment, for which the seasonal component seems to be fairly independent of the trendcycle.

## Aggregation procedures

BLS maintains and publishes several hundred seasonally adjusted labor force series in addition to the 195 directly adjusted series discussed above. The additional series are produced by arithmetically combining or aggregating the directly adjusted series with each other or, in some cases, with series on population or resident Armed Forces levels, which are not seasonally adjusted because they are not considered to have any significant seasonal variation. For example, the seasonally adjusted levels of total unemployment, civilian employment, and civilian labor force, and the seasonally adjusted civilian unemployment rate are all produced by aggregation of the seasonally adjusted results for the $\mathbf{1 2}$ major civilian labor force components. The seasonally adjusted level of total unemployment is the sum of the seasonally adjusted levels of unemployment for the four age-sex groups-men and women 16 to 19 , and men and women 20 years and over. Seasonally adjusted civilian employment is the sum of the seasonally adjusted levels of employment for the eight employment components-the same four age-sex groups as noted above employed, respectively, in nonagricultural and agricultural industries. The seasonally adjusted civilian labor force is the sum of all 12 components. The seasonally adjusted civilian unemployment rate is calculated by taking the total seasonally adjusted unemployment level as a percent of the total seasonally adjusted civilian labor force. For the overall labor force, the resident Armed Forces level is added to the seasonally adjusted civilian labor force, and the seasonally adjusted overall unemployment rate
is, of course, calculated by taking totai seasonalily adjusted unemployment as a percent of that labor force figure.

The principal reason for producing many of the major seasonally adjusted estimates for the labor force by aggregation rather than by direct adjustment is that this approach ensures that the major seasonally adjusted totals will be consistent (additively) with at least one major set of components. If the totals were directly adjusted along with the components, such consistency would not, in all likelihood, occur, since the X-11 is not a sum-preserving procedure; that is, the sum of the result for two or more directly adjusted series will not generally be the same as the result of directly adjusting the sum of the unadjusted versions of the same series. The various components tend to have significantly different patterns of seasonal variation; for example, teenage unemployment tends to peak in June, while unemployment of adult men tends to peak in the winter months of January and February. It is necessary to directly adjust the components in order to properly estimate these varying seasonal patterns. Of course, one of the implications of producing seasonally adjusted estimates for many major series by aggregation is that exact factors cannot be projected for those series. However, implicit seasonal factors can be calculated after the fact by taking the ratio of the unadjusted aggregate to the seasonally adjusted aggregate, or, for additive implicit factors, the difference between those two aggregates.

## Alternative seasonal adjustment procedures

BlS regularly computes several unofficial seasonally adjusted unemployment rate series based on alternative approaches. The results are presented in a monthly table released with the testimony of Commissioner Norwood before the Joint Economic Committee. The table provides a basis for identifying the range of seasonally adjusted unemployment rates that can result from varying the procedures, although the range is somewhat constrained by the fact that all of the computed alternatives reflect the use of X-11 arima or X-II.

The alternative which has received substantial attention in recent literature ${ }^{5}$ is"concurrent adjustment," where the factors for any current month are based on data through that month. ${ }^{6}$ Concurrent adjustment has been shown to result in smaller average revisions for many series. For the civilian unemployment rate in 1984, concurrently adjusted rates to one decimal place

[^3]would have been revised in only 1 month (November, from 7.2 to 7.1 ), with an average revision over the 11 months subject to revision of $.009,67$ percent lower than the official method's already low comparable average revision of .027 .

While it is relevant to look at revisions for the unemployment rate to one decimal place (since it is published that way), it can be somewhat misleading about the magnitude of the underlying revisions, due to the effects of rounding. For example, if an unrounded rate of 7.449 (which rounds to 7.4 ) were to be revised to 7.451 (which rounds to 7.5 ), the revision for the rate as published would be . 1 even though the revision for the unrounded rate was only .002 and the underlying revisions to levels would most likely have been very small. This effect can also work the other way-an unrounded rate of 7.451 could be revised to 7.549 , resulting in no revision to the rate as published but clearly indicating more substantial revisions in the underlying levels. These effects of rounding will not necessarily balance out over an 11-month period, and so it can be more informative, particularly with respect to the underlying levels, to look at revisions based on the rate calculated to more decimal places. For the civilian rate calculated to three decimal places, the average revision for the official method was .043 , while the comparable figure for the concurrent method was .020 , about 53 percent lower. If we look at the month-to-month changes between the rates calculated to three decimal places, the average revision to those changes as produced by the of-
ficial method was .046 while the comparable figure for the concurrent method was .032 , aboui 30 pelcent lower.

The concurrent method resulted in fewer and smaller revisions to the unemployment rate in 1984. It should be kept in mind, however, that revisions of .1 or less to rates in the $7-8$ percent range are less than the standard errors for the unadjusted versions of those rates. Concurrent adjustment also precludes prior publication of seasonal factors, which BlS has historically considered important to public confidence in the data. Given the performance of concurrent adjustment, it certainly deserves further attention, but it is not yet clear that its advantages outweigh the disadvantages.

## Availability of revised series

As indicated above, much of the revised seasonally adjusted data is being published in this and next month's issues of Employment and Earnings. Additional data for any of the several hundred seasonally adjusted labor force series, as well as the January-June 1985 factors for any of the directly adjusted series beyond the 12 major components, can be obtained from BLS upon request. Requests for data or inquiries concerning the seasonal adjustment methodology or the availability of machinereadable files of labor force data should be addressed to the Division of Data Development and Users' Services, Office of Employment and Unemployment Statistics, Bureau of Labor Statistics, Washington, D.C. 20212.

Table 3. Current seasonal adjustment factors for the 12 major civilian labor force components, January-June 1985

# New Data on Union Members and Their Earnings 

*Paul O. Flaim

This issue of Employment and Earnings introduces a new series of annual data on the extent of unionization among American workers and on the basic differences in earnings between workers who are unionized and those who are not. This new series begins with annual averages for 1983 and 1984, which are presented in tables 52 through 55 (pages 208-211).

The data in tables 52 and 53 show the number and characteristics of persons in wage and salary jobs who belonged to unions as well as separate data on workers who, although not belonging to unions, were in jobs covered by union contracts. Tables 54 and 55 contain data on the reported usual weekly earnings of full-time wage and salary workers in these two universes as well as on the earnings of workers who neither belong to unions nor are covered by union contracts.
This new information is obtained through the Current Population Survey, the monthly survey of about 60,000 households which provides the basic information on the Nation's labor force. Beginning in January 1983, two special questions focusing on union membership and union coverage were added to the questionnaire used in this survey. The two questions are being asked monthly in one-fourth of the survey's households. Specifically, they are asked of respondents in the so-called "outgoing rotation groups,"' that is, in households which are either in their fourth or eighth month in the sample. (Households falling in the CPS sample are visited by interviewers for 4 consecutive months; they are then dropped from the sample for 8 months; and they then return to the sample for a second and final 4 -month stint.)

The survey questions relating to unions are the last in a sequence focusing on the nature of the job held by employed persons, that is, the occupation and industry, the hours worked, and the hourly and weekly earnings (earnings are asked only of the outgoing rotation groups). After providing this information concerning a specific household member, the survey respondent is asked whether "on this job" the worker in question "is a member of a labor union or of an employee association similar to a union." If the answer to this question is

[^4]"no," a further question is asked to determine whether "on this job" the worker is "covered by a union or employee association contract."

As indicated in table 52, about 17.3 million wage and salary workers-out of a total of 92.2 million-were reported in 1984 as belonging to unions. The total reporting either membership or coverage was 19.9 million. Taken as a percent of total wage and salary employment, these numbers yield a unionization rate for 1984 equal to 18.8 percent in terms of actual membership and 21.6 percent in terms of coverage, with both of these proportions showing a decline relative to the averages for 1983. The data in table 53 show large variations among the various occupations and industries in the proportions of workers who are members of unions or are covered by union contracts. In terms of earnings, the data in table 54 show that, among all fulltime wage and salary workers, those who belonged to unions in 1984 earned 33 percent more a week than those who were not unionized. However, as is shown both by the data in table 54 and those in table 55, for some specific groups the earnings differences between organized and nonorganized workers are much smaller-and even nonexistent.

Data of similar nature had previously been collected through special questions asked only once a year, each May, but of the entire CPS sample. However, the special May survey, into which a question concerning union membership was first introduced in 1973, had to be suspended after 1980 because of budget constraints. The new data are very comparable with those previously collected each May. There are, however, some differences which should be pointed out. For example, as is also the case for the questions on usual weekly earnings, the new questions on union membership are not asked of those workers who are reported as self-employed but who, in the basic labor force data, are classified as wage and salary workers because they have incorporated their business. Of course, another difference is that the new series, as published here, reflect the "average" situation during the entire course of the year, both for 1983 and 1984, whereas the old series available through 1980 were only reflective of the situation as of May of the year in question, and may thus have been affected by seasonal
variation. Also, prior to 1977 , the question on union membership did not include any mention of employee associations.

Both the data previously collected in May and the new series are subject to sampling errors. However, the annual average data, being an accumulation of data obtained monthly from one-fourth of the CPS sample, or the equivalent of three full monthly samples over the course of the year, are subject to smaller sampling errors than those associated with the May data. Finally, the data may also be subject to nonsampling errors, such as a possible systematic bias in reporting union
membership and weekly earnings. ${ }^{1}$
An analysis of the new data on union membership, including a comparison with those collected in 1980 through the May CPS, will appear in the February 1985 issue of the Monthly Labor Review.
' For a discussion of the reliability of the earnings data collected through the Current Population Survey, see Larry Carstensen and Henry Woltman, "Comparing Earnings Data from the CPS and Employer Records," The American Statistical Association, Proceedings of the Social Statistics Section, 1979. See also Earl F. Mellor. Technical Description of the Quarterly Data on Weekly Earnings from the Current Population Survey, bl.s Bulletin 2113, January 1982.

## HOUSEHOLD DATA

NOT SEASONALLY ADJUSTED
A-8. Employment status of male Vietnam-era veterans and nonveterans by age

| (Numbers in thousands) |
| :---: |

NOTE: Male Vietnam-era veterans are those who served in the Armed Forces between August 5, 1964 and May 7, 1975. Nonveterans are men who have never served in the Armed Forces; published data
are limited to those 25 to 39 years of age, the group that most closely corresponds to the bulk of the Vietnam-era veteran population.

A-9. Full- and part-time status of the civilian labor force by sex, age, and race

| 25 years and over ........................................................ | 795 | 56.7 | 694 | 101 | 12.7 | 607 | 318 | 14 | 62 | 212 |

' Excludes persons living alone or with nonrelatives, persons in married-couple families where the husband or wife is in the Armed Forces, persons in unrelated subfamilies, and those whose family status is unknown.
NOTE: Because of new estimation techniques introduced in January

1984, these data are not comparable with those for earlier years.
Moreover, estimates for husbands, wives, and women who maintain families are somewhat different from marital status estimates shown in other tables in this publication because of differences in definitions and weighting patterns used in aggregating the data.

A-11. Unemployed persons by marital status, race, age, and sex

| Occupation | Tiiuusainuto of persons |  | Unemployment rates |  |  |  |  |  |

${ }^{1}$ Data not shown where base is less than 75,000 .
NOTE: The jobseekers total is less than the total unemployed because it does not include persons on layoff or waiting to begin a new
job within 30, groups for whom jobseeking information is not collected. The percent using each method will always total more than 100 because many jobseekers use more than one method.

A-20. Unemployed jobseekers by sex, reason for unemployment, and jobsearch methods used

1 Includes members of the Armed Forces stationed in the United States.
${ }_{2}$ Labor force as a percent of the noninstitutional population
${ }^{3}$ Total employment as a percent of the noninstitutional population.
${ }^{4}$ Unemployment as a percent of the labor force (including the resident Armed Forces)

NOTE: The population and Armed Forces figures are not adjusted for seasonal variation. Detail for the seasonally adjusted data shown in tables A-32 through A-41 will not necessarily add to totals because of the independent seasonal adjustment of the various series. Seasonally adjusted data have been revised based on the experience through December 1984. See the article in this issue for additional information.

' The population figures are not adjusted for seasonal variation.
${ }^{2}$ Civilian employment as a percent of the civilian noninstitutional population.

NOTE: Seasonally adjusted data have been revised based on the experience through December 1984. See the article in this issue for additional information.

## household data

SEASONALLY ADJUSTED
A-34. Employment status of the civilian noninstitutional population by race, sex, age, and Hispanic origin, seasonally adjusted
(Numbers in thousands)

See footnotes at end of table.

A-34. Employment status of the civilian noninstitutional population by race, sex, age, and Hispanic origin, seasonally adjusted-Continued
(Numbers in thousands)

${ }^{1}$ The population figures are not adjusted for seasonal variation.
Civilian employment as a percent of the civilian noninstitutional population.
NOTE: Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented
and Hispanics are included in both the white and black population groups. Seasonally adjusted data have been revised based on the experience through December 1984. See the article in this issue for additional information.

A-35. Employed civilians by selected social and economic categories, seasonally adjusted
(In thousands)

${ }^{1}$ Data not shown where base is less than 60,000 .
NOTE: Detail for the above race and Hispanic-origin groups will not
sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

## HOUSEHOLD DATA

NOT SEASONALLY ADJUSTED
QUARTERLY AVERAGES
A-68. Unemployment in families by type of family, race, Hispanic origin, and presence of employed family members

1 Data not shown where base is less than 60,000
NOTE: Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are
included in both the white and black population groups. Because of the introduction of new estimation techniques beginning with data for January 1983, these data are not comparable with those previously published.

1 Excludes persons living alone or with nonrelatives, persons in married-couple families where the husband or wife is in the Armed Forces, persons in unrelated subfamilies, and those whose family status is unknown
2 Data not shown where base is less than 60,000 .
NOTE: Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are
included in both the white and black population groups. Because of the introduction of new estimation techniques beginning with data for January 1983, these data are not comparable with those previously published. Moreover, estimates for husbands, wives, and women who maintain families are somewhat different from marital status estimates shown in other tables in this publication because of differences in definitions and weighting patterns used in aggregating the data.

A-70. Employed civilians by family relationship, race, Hispanic origin, and presence of additional employed family members
(Numbers in thousands)

${ }^{1}$ Excludes persons living alone or with nonrelatives, persons in married-couple families where the husband or wife is in the Armed Forces, persons in unvelated subfamilies, and those whose family status is unknown.

2 Data not shown where base is less than 60,000
NOTE: Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not preserted and Hispanics are
included in both the white and black population groups. Because of the introduction of new estimation techniques beginning with data for January 1983, these data are not comparable with those previously published. Moreover, estimates for husbands, wives, and women who maintain families are somewhat different from marital status estimates shown in other tables in this publication because of differences in definitions and weighting patterns used in aggregating the data.

A-71. Median weekly earnings of families by type of family, number of earners, race, and Hispanic origin

${ }^{1}$ Data exclude families in which there is no wage or salary earner or in which the husband, wife, or other person maintaining the family is either self-employed or in the Armed Forces.
${ }^{2}$ Data not shown where base is less than 100,00c.
NOTE: The Consumer Price Index for All Urban Consumers (CPI-U) is used to deflate quarterly earnings data published in tables A-71 through A-75. Because the index for the most recent quarter is not available at the time Employment and Earnings is published, it is necessary to lag the publication of these tables by 1 quarter. Data on families for 1984
reflect revised editing and weighting procedures and are not comparable with data for 1983 and prior years. Moreover, data on median weekly earnings are now derived using $\$ 10$ intervals rather than the $\$ 50$ intervals previously used. Data for 1983 and prior years have been recalculated and are not comparable with previously published data Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

## A-72. Families with unemployed members and wage and salary workers by type of family and median weekly earnings

' Data exclude families in which there is no wage or salary earner or in which the husband, wife, or other person maintaining the family is either self-employed or in the Armed Forces.

2 Data not shown where base is less than 100,000.
NOTE: Data on families for 1984 reflect revised editing and weighting
procedures and are not comparable with data for 1983 and prior years. Moreover, data on median weekly earnings are now derived using $\$ 10$ intervals rather than the $\$ 50$ intervals previously used. Data for 1983 and prior years have been recalculated and are not comparable with previously published data.

ESTABLISHMENT DATA
EMPLOYMENT
NOT SEASONALLY ADJUSTED
B-2. Employees on nonagricultural payrolls by detailed industry-Continued
(In thousands)

' Data relate to production workers in mining and manufacturing; construction workers in construction; and nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services.
${ }^{2}$ Beginning in January 1978, data relate to line haul railroads with operating revenues of $\$ 50,000,000$ or more.
${ }^{3}$ Data for nonoffice sales agents are excluded from the nonsupervisory count for all series in this division.
${ }^{4}$ Prepared by the Office of Personnel Management. Data relate to
civilian employment only and exclude the Central Intelligence Agency and the National Security Agency.

- Data not available.
${ }^{\circ}=$ preliminary.
NOTE: Establishment survey estimates are currently projected from March 1983 benchmark levels. When more recent benchmark data are introduced, all unadjusted data from April 1983 forward are subject to revision.

Based on the number of employees, seasonally adjusted for 1 , 3 , and 6 month spans, on the payrolls of 185 private nonagricultural industries. Data for the 12 -month span are unadjusted.
${ }^{p}=$ preliminary.
NOTE: Figures are the percent of industries with employment
rising. (Half of the unchanged components are counted as rising.) Data are centered within the spans. Establishment survey estimates are currently projected from March 1983 benchmark levels. When more recent benchmark data are introduced, all seasonally adjusted data from January 1980 forward are subject to revision.

${ }^{1}$ Data relate to production workers in mining and manufacturing; construction workers in construction; and nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance and real estate; and services.
${ }_{2}$ These series are not published seasonally adjusted because the seasonal components are small relative to the trend-cycle and/or irregular
components and consequently cannot be separated with sufficient precision. ${ }^{\mathrm{p}}=$ preliminary.
NOTE: Establishment survey estimates are currently projected from March 1983 benchmark levels. When more recent benchmark data are introduced, all seasonally adjusted data from January 1980 fonward are subject to revision.

## ESTABLISHMENT DATA <br> HOURS <br> SEASONALLY ADJUSTED

C-6. Indexes of aggregate weekly hours of production or nonsupervisory workers ' on private nonagricultural payrolls by major industry and manufacturing group, seasonally adjusted
$(1977=100)$

${ }^{1}$ Data are obtained directly from the Current Population Survey. See the Explanatory Notes for State and Area Labor Force Data.
${ }^{2}$ Not available.
p = preliminary.
NOTE: Data refer to place of residence. Estimates for 1983 have been
benchmarked to 1983 Current Population Survey annual averages. Except in the 10 States and 2 areas designated by footnote 1, estimates for 1984 are provisional and wili be revised when new benchmark intormation becomes available. Area definitions are published annually in the May issue of this publication.

## Annual Averages

## 1. Employment status of the civilian noninstitutional population, 1929 to date

(Numbers in thousands)

2. Employment status of the civilian noninstitutional population 16 years and over by sex, 1951 to date
(Numbers in thousands)

${ }^{1}$ Not strictly comparable with data for prior years. For an explanation, see Notes.
"Historical Comparability" under the Household Data section of the Explanatory

## 3. Employment status of the civilian noninstitutional population by age, sex, and race

## 3. Employment status of the civilian noninstitutional population by age, sex, and race-Continued

(Numbers in thousands)

## 3. Employment status of the civilian noninstitutional population by age, sex, and race-Continued

(Numbers in thousands)

## 5. Employment status of the civilian noninstitutional population by race, sex, and age

(Numbers in thousands)

NOTE: Male Vietnam-era veterans are men who served in the Armed Forces between August 5, 1964 and May 7, 1975. Nonveterans are men who have never served in the Armed Forces; published data are limited to those 25 to 39 years of age, the group that most closely corresponds to the bulk of the Vietnam-era veteran population. Although Public Law 96-466 (the Veterans Rehabilitation and Education

Amendments of 1980), which became effective October 17, 1980, requires publication of labor market data for veterans who actually served in Vietnam theater of operations, these data are not presently collected. Because of the widespread interest in statistics for all Vietnam-era veterans, the BLS is continuing publication of annual data for this group since these data are currently available.

## 48. Employment status of male Vietnam-era veterans and nonveterans by age, race, and Hispanic origin

## (Numbers in thousands)

| Employment status and age | Veterans |  |  |  |  |  | Nonveterans |  |  |  |  |  |

1 Excludes persons living alone or with nonrelatives, persons in married-couple families where the husband or wile is in the Armed Forces, persons in unrelated subfamilies, and those whose family status is unknown.

2 Data not shown where base is less than 35,000.
NOTE: Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are
included in both the white and black population groups. Because of the introduction of new estimation techniques beginning with data for January 1983, these data are not comparable with those previously published. Moreover, estimates for husbands, wives, and women who maintain families are somewhat different from marital status estimates shown in other tables in this publication because of differences in definitions and weighting patterns used in aggregating the data.
51. Employed civilians by family relationship, race, Hispanic origin, and presence of additional employed family members

' Data refer to members of a labor union or an employee association similar to a union.
${ }_{2}$ Data refer to members of a labor union or an employee association similar to a union as well as workers who report no union affiliation but whose jobs are covered by a union or an employee association contract.

The distinction between full- and part-time workers is based on hours usually worked.

NOTE: Data refer to the sole or principal job of fult- and part-time workers. Excluded are self-employed workers whose businesses are incorporated although they technically quality as wage and salary workers. Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

## 53. Employed wage and salary workers by occupation, industry, and union affiliation

' Data reiate to production workers in mining and manufacturing; construction workers in construction; and nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services.

Not available.
= preliminary.
NOTE: Establishment survey estimates are currently projected from March 1983 benchmark levels. When more recent benchmark data are introduced, all unadjusted data from April 1983 forward are subject to revision.

# Explanatory Notes 

## Introduction

The statistics in this periodical are compiled from two major sources: (1) Household interviews, and (2) reports from employers.

Data based on household interviews are obtained from a sample survey of the population 16 years of age and over. The survey is conducted each month by the Bureau of the Census for the Bureau of Labor Statistics and provides comprehensive data on the labor force, the empioyed, and the unemployed, including such characteristics as age, sex, race, family relationship, marital status, occupation, and industry attachment. The survey also provides data on the characteristics and past work experience of those not in the labor force. The information is collected by trained interviewers from a sample of about 60,000 households, representing 629 areas in 1,148 counties and independent cities, with coverage in 50 States and the District of Columbia. The data collected are based on the activity or status reported for the calendar week including the 12 th of the month.

Data based on establishment records are compiled each month from mail questionnaires by the Bureau of Labor Statistics, in cooveration with State agencies. The establishment survey is designed to provide industry information on nonagriculutral wage and salary employment, average weekly hours, average hourly earnings, and average weekly earnings for the Nation, States, and metropolitian areas. The employment, hours, and earnings series are currently based on payroll reports from a sample of over 200,000 establishments employing over 35 million nonagricultural wage and salary workers. The data relate to all workers, full- or part-time, who received pay during the payroll period which includes the 12 th day of the month.

## RELATION BETWEEN THE HOUSEHOLD AND ESTABLISHMENT SERIES

The household and establishment data supplement one another, each providing significant types of information that the other cannot suitably supply. Population characteristics, for example, are readily obtained only from the household survey whereas detailed industrial classifications can be reliably derived onlly from establishment reports.

Data from these two sources differ from each other because of differences in definitions and coverage,
sources of information, methods of collection, and estimating procedures. Sampling variability and response errors are additional reasons for discrepancies. The major factors which have a differential effect on levels and trends of the two series are as follows.

## Employment

Coverage. The household survey definition of employment comprises wage and salary workers (including domestics and other private household workers) selfemployed persons, unpaid workers who worked 15 hours or more during the survey week in familyoperated enterprises, and members of the Armed Forces stationed in the United States. Civilian employment in both agricultural and nonagricultural industries is included. The payroll survey covers only wage and salary employees on the payrolls of nonagricultural establishments.

Multiple jobholding. The household survey provides information on the work status of the population without duplication, since each person is classified as employed, unemployed, or not in the labor force. Employed persons holding more than one job are counted only once and are classified according to the job at which they worked the greatest number of hours during the survey week. In the figures based on establishment reports, persons who worked in more than one establishment during the reporting period are counted each time their names appear on payrolls.

Unpaid absences from jobs. The housheold survey includes among the employed all civilians who had jobs but were not at work during the survey week-that is, were not working but had jobs from which they were temporarily absent because of illness, bad weather, vacation, labor-management disputes, or because they were taking time off for various other reasons, even if they were not paid by their employers for the time off. In the figures based on payroll reports, persons on leave paid for by the company are included, but not those on leave without pay for the entire payroll period.

For a comprehensive discussion of the differences between household and establishment survey.employment data, see Gloria P. Green's article "Comparing Employment Estimates From Household and Payroll Surveys," Monthly Labor Review, December 1969.

## Hours of work

The household survey measures hours actually worked whereas the payroll survey measures hours paid for by employers. In the household survey data, all persons with a job but not at work are excluded from the hours distributions and the computations of average hours. In the payroll survey, production or nonsupervisory employees on paid vacation, paid holiday, or paid sick leave are included and assigned the number of hours for which they were paid during the reporting period.

## Earnings

The household survey measures median earnings of wage and salary workers in all occupations and industries in both the private and public sectors. Data refer to the usual earnings received from the worker's sole or primary job. Data from the establishment survey generally refer to average earnings of production and related workers in mining and manufacturing, construction workers in construction, and nonsupervisory employees in private service-producing industries. For a comprehensive discussion of the household survey earnings series, see Technical Description of the Quarterly Data on Weekly Earnings from the Current Population Survey, BLS Bulletin 2113.

## COMPARABILITY OF THE HOUSEHOLD DATA WITH OTHER SERIES

Unemployment insurance data. The unemployed total from the household survey includes all persons who did not have a job at all during the survey week and were looking for work or were waiting to be called back to a job from which they had been laid off, whether or not they were eligible for unemployment insurance. Figures on unemployment insurance claims, prepared by the Employment and Training Administration of the Department of Labor, exclude persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (some workers in agriculture, domestic services, and religous organizations, and self-employed and unpaid family workers). Beginning in January 1978, coverage was extended to include domestic workers whose employers paid $\$ 1,000$ or more in wages in any calendar quarter, agricultural employees whose employers engaged 10 or more workers in 20 weeks or paid a total of $\$ 20,000$ or more in wages in any calendar quarter, and almost all State and local government employees.

In addition, the qualifications for drawing unemployment compensation differ from the definition of unemployment used in the household survey. For example, persons with a job but not at work and persons working only a few hours during the week are
sometimes eligible for unemployment compensation but are classified as employed rather than unemployed in the household survey.

For an examination of the similarities and differences between State insured unemployment and total unemployment, see "Measuring Total and State Insured Unemployment'" by Gloria P. Green in the June 1971 issue of the Monthly Labor Review.

Agricultural employment estimates of the Department of Agriculture. The principal differences in coverage are the inclusion of persons under 16 in the Economics and Statistics Service series and the treatment of dual jobholders, who are counted more than once if they work on more than one farm during the reporting period. There are also wide differences in sampling techniques and collecting and estimating methods, which cannot be readily measured in terms of impact on differences in level and trend of the two series.

## COMPARABILITY OF THE PAYROLL EMPLOY. MENT DATA WITH OTHER SERIES

Statistics on manufactures and business, Bureau of the Census. BLS establishment statistics on employment differ from employment counts derived by the Bureau of Census from its censuses or sample surveys of manufacturing and business establishments. The major reasons for noncomparability are different treatment of business units considered parts of an establishment, such as central administrative offices and auxiliary units, the industrial classification of establishments, and different reporting patterns by multiunit companies. There are also differences in the scope of the industries covered, e.g., the Census of Business excludes professional services, public utilities, and financial establishments, whereas these are included in the BLS statistics.

County Business Patterns. Data in County Business Patterns (CBP), published by the Bureau of the Census, U.S. Department of Commerce, differ from BLS establishment statistics in the treatment of central administrative offices and auxiliary units. Differences may also arise because of industrial classification and reporting practices. In addition, CBP excludes interstate railroads and government, and coverage is incomplete for some of the nonprofit activities.

Employment covered by State unemployment insurance programs. Most nonagricultural wage and salary workers are covered by the unemployment insurance programs. However, certain activities, such as interstate railroads, parochial schools, and churches are not covered by unemployment insurance whereas these are included in this BLS establishment statistics.

# Household Data (A tables) 

## COLLECTION AND COVERAGE

Statistics on the employment status of the population, the personal, occupational, and other characteristics of the employed, the unemployed, and persons not in the labor force, and related data are compiled for the BLS by the Bureau of the Census in its Current Population Survey (CPS). A detailed description of this survey appears in Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey, BLS Report 463. Historical national data are published in Labor Force Statistics Derived From the Current Population Survey: A Databook, bl S Bulletin 2096.

These monthly surveys of the population are conducted with a scientifically selected sample designed to represent the civilian noninstitutional population. Respondents are interviewed to obtain information about the employment status of each member of the household 16 years of age and over. Separate statistics are also collected for 14-and 15 -year-olds. The inquiry relates to activity or status during the calendar week, Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted in the following week.

Inmates of institutions and persons under 14 years of age are not covered in the regular monthly enumerations, and are excluded from the population and labor force statistics shown in this report. Data on the members of the Armed Forces stationed in the United States, who are included as part of the categories "noninstitutional population," "labor force," and "total employment," are obtained from the Department of Defense.

Each month about 60,000 occupied units are eligible for interview. About 2,500 of these households are visited but interviews are not obtained because the occupants are not at home after repeated calls or are unavailable for other reasons. This represents a noninterview rate for the survey of between 4 or 5 percent. In addition to the 60,000 occupied units, there are 11,000 sample units in an average month which are visited but found to be vacant or otherwise not to be enumerated. Part of the sample is changed each month. The rotation plan provides for three-fourths of the sample to be common from 1 month to the next and onehalf to be common with the same month a year earlier.

## CONCEPTS AND DEFINITIONS

The concepts and definitions underlying labor force data have been modified, but not substantially altered, since the inception of the survey in 1940; those used since 1967 are as follows:

Employed persons are (a) all civilians who, during the survey week, did any work at all as paid employees, in their own business, profession, or on their own farm, or
who worked 15 hours or more as unpaid workers in an enterprise operated by a member of the family; and (b) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, labormanagement disputes, or personal reasons, whether they were paid for the time off or were seeking other jobs. Members of the Armed Forces stationed in the United States are also included in the employed total.

Each employed person is counted only once. Those who held more than one job are counted in the job at which they worked the greatest number of hours during the survey week.

Included in the total are employed citizens of foreign countries who are temporarily in the United States but not living on the premises of an embassy. Excluded are persons whose only activity consisted of work around the house (painting, repairing, or own home housework) or volunteer work for religious, charitable, and similar organizátions.

Unemployed persons are all civilians who had no employment during the survey week, were available for work, except for temporary illness, and (a) had made specific efforts to find employment sometime during the prior 4 weeks, or (b) were waiting to be recalled to a job from which they had been laid off, or (c) were waiting to report to a new job within 30 days.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of seeking work. Measurements of mean and median duration are computed from a distribution of single weeks of unemployment.

Unemployment is also categorized according to the status of individuals at the time they began to look for work. The reasons for unemployment are divided into four major groups. (1) Job losers are persons whose employment ended involuntarily who immediately began looking for work, and persons on layoff. (2) Job leavers are persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work. (3) Reentrants are persons who previously worked at a full-time job lasting 2 weeks or longer but were out of the labor force prior to beginning to look for work. (4) New entrants are persons who never worked at a full-time job lasting 2 weeks or
longer. Each of these four categories of the unemployed may be expressed as an unemployment rate or proportion of the entire civilian labor force; the sum of the four rates thus equals the unemployment rate for all civilian workers.

Jobseekers are all unemployed persons who made specific efforts to find a job sometime during the 4 -week period preceding the survey week. Jobseekers do not include those persons unemployed because they (a) were waiting to be called back to a job from which they had been laid off or (b) were waiting to report to a new job within 30 days. Jobseekers are grouped by the methods used to seek work, including going to a public or private employment agency or to an employer directly, seeking assistance from friends or relatives, placing or answering ads, or utilizing some other method. Examples of the "other" category include being on a union or professional register, obtaining assistance from a community organization, or waiting at a designated labor pickup point.

The civilian labor force comprises all civilians classified as employed or unemployed in accordance with the criteria described above. The "labor force" also includes members of the Armed Forces stationed in the United States.

The overall unemployment rate represents the number unemployed as a percent of the labor force, including members of the Armed Forces stationed in the United States.

The unemployment rate for all civilian workers represents the number unemployed as a percent of the civilian labor force. This measure can also be computed for groups within the labor force classified by sex, age, race, Hispanic origin, marital status, etc.

Participation rates represent the proportion of the population that is in the labor force. The labor force participation rate, is the ratio of the labor force, including the resident Armed Forces, to the noninstitutional population. The civilian labor force participation rate is the ratio of the civilian labor force to the civilian noninstitutional population. Civilian labor force participation rates are usually published for sex-age groups, often cross-classified by other demographic characteristics such as race and educational attainment.

Employment-population ratios represent the proportion of the noninstitutional population that is employed. The total employment-population ratio is total employment, including the resident Armed Forces, as a percent of the noninstitutional population. The civilian employment-population ratio is the percentage of all employed civilians in the civilian noninstitutional population.

Not in the labor force includes all persons who are not classified as employed or unemployed. These persons are further classified as engaged in own home housework, in school, unable to work because of long-
term physical or mental illness, retired, and other. The "other" group includes individuals reported as too old or temporarily unable to work, the voluntarily idle, seasonal workers for whom the survey week fell in an off season and who were not reported as looking for work, and persons who did not look for work because they believed that no jobs were available in the area or that no jobs were available for which they could qualify-discouraged workers. Persons doing only incidental, unpaid family work (less than 15 hours in the specified week) are also classified as not in labor force.

For persons not in the labor force, data on previous work experience, intentions to seek work, desire for a job at the time of interview, and reasons for not looking for work are published on a quarterly basis. As of January 1970, the detailed questions for persons not in the labor force are asked only in those households that are in the fourth and eighth months of the sample, i.e., the "outgoing" groups, those which had been in the sample for 3 previous months and would not be in for the subsequent month. Between 1967 and 1969 these questions were asked in those households entering the sample for the first time and those returning for the second 4 months of interviewing, i.e., the "incoming" groups.

Occupation, industry, and class of worker for the employed apply to the job held in the survey week. Persons with two or more jobs are classified in the job at which they worked the greatest number of hours during the survey week. The unemployed are classified according to their last full-time job lasting 2 weeks or more. The classifications of occupations and industries used in data derived from the CPS are defined as in the 1980 census. Information on the detailed categories included in these groups is available upon request.

The class-of-worker breakdown specifies wage and salary workers, subdivided into private and government workers; self-employed workers; and unpaid family workers. Wage and salary workers receive wages, salary, commission, tips, or pay in kind from a private employer or from a government unit. Self-employed persons are those who work for profit or fees in their own business, profession, or trade, or operate a farm. Unpaid family workers are persons working without pay for 15 hours a week or more on a farm or in a business operated by a member of the household to whom they are related by birth or marriage.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, persons who normally work 40 hours a week but were off on the Columbus Day holiday would be reported as working 32 hours even though they were paid for the holiday. For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the week; all the hours are credited to the major job.

The distribution of employment by hours worked relates to persons at work during the survey week. Atwork data differ from data on total employment because the latter include persons in the zero-hoursworked category, with a job but not at work. Included in this latter group are persons who were on vacation, ill, involved in a labor dispute, or otherwise absent from their jobs for voluntary, noneconomic reasons.

Persons who worked 35 hours or more in the survey week are designated as working full time. Persons who worked between 1 and 34 hours are designated as working pari time. Part-time workers are classified by their usual status at their present job (either full or part time) and by their reason for working part time during the survey week (economic or other reasons). Economic reasons include: Slack work, material shortages, repairs to plant or equipment, start or termination of a job during the week, and inability to find full-time work. Other reasons include: Labor dispute, bad weather, own illness, vacation, demands of home, housework, school, no desire for full-time work, and full-time worker only during peak season. Persons on full-time schedules include, in addition to those working 35 hours or more, those who worked from 1 to 34 hours for noneconomic reasons and usually work full time.

The full-time labor force consists of persons working on full-time schedules, persons involuntarily working part time (part time for economic reasons), and unemployed persons seeking full-time jobs. The parttime labor force consists of persons working part time voluntarily and unemployed persons seeking part-time work. Persons with a job but not at work during the survey week are classified according to whether they usually work full or part time.

Labor force time lost is a measure of aggregate hours lost to the economy through unemployment and involuntary part-time employment and is expressed as a percent of potentially available aggregate hours. It is computed by assuming that: (1) Unemployed persons looking for full-time work lost an average of 37.5 hours, (2) those looking for part-time work lost the average number of hours actually worked by voluntary parttime workers during the survey week, and (3) persons on part time for economic reasons lost the difference between 37.5 hours and the actual number of hours they worked.

White, black, and other are terms used to describe the race of workers. Included in the "other" group are American Indians, Alaskan Natives, and Asians and Pacific Islanders. All tables in this publication which contain racial data, with the exception of A-5 and its annual counterpart, present data for the black population group. Because of their relatively small sample size, data for "other" races are not published. In the enumeration process, race is determined by the household respondent.

Hispanic origin refers to persons who identified themselves in the enumeration process as Mexican, Puerto Rican living on the mainland, Cuban, Central or South American, or of other Hispanic origin or descent. Persons of Hispanic orgin may be of any race; thus they are included in both the white and black population groups.

Vietnam-era veterans are those who served in the Armed Forces of the United States between August 5, 1964, and May 7, 1975. Data are limited to men in the civilian noninstitutional population; i.e., veterans in institutions and women are excluded. Nonveterans are men who never served in the Armed Forces.

Usual weekly earnings data are provided from responses to the question "How much does...USUALLY earn per week at this job before deductions?" Included are any overtime pay, commissions, or tips usually received. The term "usual" is as perceived by the respondent. If the respondent asks for a definition of usual, interviewers are instructed to define the term as more than half the weeks worked during the past 4 or 5 months. Data refer to wage and salary workers (excluding the incorporated self-employed) who usually work full time on their sole or primary job.

Median earnings indicate the value which divides the earnings distribution into two equal parts, one part having values above the median and the other having values below the median. The medians as shown in this publication are calculated by linear interpolation of the $\$ 10$ interval within which each median falls.

The Consumer Price Index for All Urban Consumers (CPI-U) is used to deflate the earnings series.

Single, never married; married, spouse present; and other marital status are terms used to define the marital status of individuals at the time of interview. Married, spouse present, applies to husband and wife if both were reported as members of the same household even though one may be temporarily absent on business, vacation, on a visit, in a hospital, etc. Other marital status applies to persons who are married, spouse absent; widowed; or divorced. Married, spouse absent, includes persons who are separated because of marital discord, as well as persons who are living apart because either the husband or the wife was employed and living away from home, serving in the Armed Forces, or had a different place of residence for any reason.

A household consists of all persons-related family members and all unrelated persons-who occupy a housing unit. A house, an apartment, a group of rooms, or a single room is regarded as a housing unit when occupied or intended for occupancy as separate living quarters.

A householder is the person (or one of the persons) in whose name the housing unit is owned or rented. The term is never applied to either husbands or wives in married-couple families but relates only to persons in
families maintained by either men or women without a spouse.

Family refers to a group of two or more persons residing together who are related by birth, marriage, or adoption; all such persons are considered as members of one family even though they may include a related subfamily, that is, a married couple or a parent-child group related by birth or marriage to the householder and sharing the living quarters. The count of families used in this publication excludes unrelated subfamilies such as lodgers, guests, or resident employees living in a household but not related to the householder. Families are classified either as married-couple families or as families maintained by women or men without spouses. A family maintained by a woman or a man is one in which the householder is either single, widowed, divorced, or married, spouse absent. Data on the earnings of families exclude all those in which there is no wage or salary earner or in which the husband, wife, or other persons maintaining the family is either self-employed or in the Armed Forces.

## HISTORICAL COMPARABILITY

## Change in lower age limit

The lower age limit for official statistics on the labor force, employment, and unemployment was raised from 14 to 16 years of age in January 1967. Insofar as possible, historical series have been revised to provide consistent information based on the population 16 years and over. For a detailed discussion of this and other definitional changes introduced at that time, including estimates of their effect on the various series, see "New Definitions for Employment and Unemployment," Employment and Earnings and Monthly Report on the Labor Force, February 1967.

## Noncomparability of labor force levels

In addition to the changes introduced in 1967, there are several other periods of noncomparability in the labor force data: (1) Beginning in 1953, as a result of introducing data from the 1950 census into the estimating procedures, population levels were raised by about 600,000 ; labor force, total employment, and agricultural employment were increased by about 350,000 , primarily affecting the figures for totals and men; other categories were relatively unaffected. (2) Beginning in 1960, the inclusion of Alaska and Hawaii resulted in an increase of about 500,000 in the population and about 300,000 in the labor force-four-fifths of this increase was in nonagricultural employment; other labor force categories were not appreciably affected. (3) Beginning in 1962, the introduction of data from the 1960 census reduced the population by about 50,000 and labor force and employment by about 200,000 ; unemployment totals were virtually unchanged. (4)

Beginning in 1972, information from the 1970 census was introduced into the estimation procedures, increasing the population by about 800,000 ; labor force and employment totals were raised by a little more than 300,000 ; and unemployment levels and rates wers essentially unchanged. (5) A subsequent population adjustment based on the 1970 census was introduced in March 1973. This adjustment, which affected the white and black-and-other groups but had little effect on totals, resulted in the reduction of nearly 300,000 in the white population and an increase of the same magnitude in the black-and-other population. Civilian labor force and total employment figures were affected to a lesser degree; the white labor force was reduced by 150,000 , and the black-and-other labor force rose by about 210,000 . Unemployment levels and rates were not significantly affected.

In addition, beginning in January 1974, the methodology used to prepare independent estimates of the civilian noninstitutional population was modified to an inflation-deflation approach. This change in the derivation of the estimates had its greatest impact on estimates of 20 - to 24 -year-old men-particularly those of the black-and-other population-but had little effect on estimates of the total population 16 years and over. Additional information on the adjustment procedure appears in "CPS Population Controls Derived from Inflation-Deflation Method of Estimation", in the February 1974 issue of Employment and Earnings.

Effective in July 1975, as a result of the immigration of Vietnamese refugees into the United States, the total and black-and-other independent population controls for persons 16 years and over were adjusted upward by $76,000-30,000$ men and 46,000 women. The addition of the refugees increased the black-and-other population by less than 1 percent in any age-sex group, and all of the changes were in the other population.

Beginning in January 1978, the introduction of an expansion in the sample and revisions in the estimation procedures resulted in an increase of about 250,000 in the civilian labor force and employment totals; unemployment levels and rates were essentially unchanged. An explanation of the procedural changes and an indication of the differences appear in "Revisions in the Current Population Survey in January 1978" in the February 1978 issue of Employment and Earnings.
Beginning in October 1978, the race of the individual was determined by the household respondent for the incoming rotation group households, rather than by the interviewer as before. The purpose of this change was to provide more accurate estimates of characteristics by race. Thus, in October 1978, one-eighth of the sample households had race determined by the household respondent and seven-eighths of the sample households had race determined by interviewer observation. It was not until January 1980 that the entire sample had race
determined by the household respondent. The new procedure had no significant effect on the estimates.

Beginning in January 1979, the first-stage ratio estimation method was changed in the CPS estimation procedure. Differences between the old and new procedures exist only for metropolitan and nonmetropolitan area estimates, not for the total United States. The reasoning behind the change and an indication of the differences appear in "Change in the Estimation Procedure for the Current Population Survey Beginning in January 1979'' in the February 1979 issue of Employment and Earnings

Beginning in January 1982, the second-stage ratio adjustment methodology was changed in the CPS estimation procedure. The new procedure is described in the Estimating Methods section. The purpose of the change and an indication of its effect on national estimates of labor force characteristics appear in "Revisions in the Current Population Survey Beginning in January 1982"' in the February 1982 issue of Employment and Earnings. In addition, current population estimates used in the second-stage estimation procedure are derived from information obtained from the 1980 census, rather than the 1970 census. This change caused substantial increases in total population and estimates of persons in all labor force categories. Rates for labor force characteristics, however, remained virtually unchanged. Some 30,000 labor force series were adjusted back to 1970 to avoid major breaks in series. The adjustment procedure used is also described in the February 1982 article cited above. The revisions did not, however, smooth out the breaks in series occurring between 1972 and 1979 that are described above, and data users should make allowances for them in making certain data comparisons.

Beginning in January 1983, the first-stage ratio adjustment methodology was updated to account for results obtained from the 1980 census. The new procedure is described in the Estimating Methods section. The purpose of the change and an indication of its effect on national estimates of labor force characteristics appear in "Revisions in the Current Population Survey Beginning in January 1983'" in the February 1983 issue of Employment and Earnings. There are only slight differences between the old and new procedures in estimates of level for the various labor force characteristics and virtually no differences in estimates of participation rates.

## Changes in the occupational and industrial classification system

Beginning in 1971, the comparability of occupational employment data was affected as a result of changes in the occupational classification system for the 1970 census that were introduced into the CPS. Comparability was further affected in December 1971, when a question relating to major activity or duties was added to the
monthly CPS questionnaire in order to determine more precisely the occupational classification of individuals. As a result of these changes, meaningful comparisons of occupational employment levels could not be made between 1971-72 and prior years nor between those 2 years. Unemployment rates were not significantly affected. For a further explanation of the changes in the occupational classification system, see "Revisions in Occupational Classifications for 1971 " and "Revisions in the Current Population Survey" in the February 1971 and February 1972 issues, respectively, of Employment and Earnings.

Beginning in January 1983, the occupational and industrial classification systems used in the 1980 census were introduced into the CPS. These systems differ from those developed for the 1970 census which were used in the CPS from January 1971 through December 1982.

The 1980 census occupational classification system evolved from the Standard Occupational Classification system (SOC). While the CPS occupational data are now comparable with other data sources, the new system is so radically different in concepts and nomenclature from the 1970 system that comparisons of historical data are not possible without major adjustments. For example, the 1980 major group "sales occupations" is substantially larger than the 1970 category "sales workers'" Major additions include "cashiers" from "clerical workers" and some selfemployed proprietors in retail trade establishments from "managers and administratiors, except farm."

The industrial classification used in the 1980 census is based on the 1972 Standard Industrial Classification system (SIC), as modified in 1977. The adoption of the new system had much less of an adverse effect on historical comparability than did the new occupational system. The most notable changes from the 1970 system were the transfer of farm equipment stores from "retail" to "wholesale" trade, postal service from "public administration" to "transportation", and some interchange between "professional and related services" and "public administration."

Additional information on the 1980 census occupational and industrial classification systems appears in "Revisions in the Current Population Survey Beginning in January 1983'' in the February 1983 issue of Employment and Earnings.

## Changes in the sample design

Since the inception of the survey, there have been various changes in the design of the CPS sample. Most of these changes were made in order to improve the efficiency of the sample design and/or to increase the reliability of the sample estimates.

One major change made after every decennial census is to change the sample design to make use of the recently collected census materials. Also, the number of
sample areas and the number of sample persons are increased occasionally. In 1953, the current rotation plan was introduced in which a sample unit is interviewed for 4 months, leaves the sample for 8 months, and then returns to the sample for another 4 months. When Alaska and Hawaii achieved statehood, three more sample areas were added to account for the population in these States. After the 1960 census, selection of a major portion of the sample from census address lists was begun, though a portion of the sample is still collected using area sampling. Following the 1970 census, the ultimate sampling unit was changed from a noncontiguous cluster of six housing units to a usually contiguous cluster of four housing units. In January 1978, a supplemental sample of 9,000 housing units, selected in 24 States and the District of Columbia and designed to provide more reliable annual average estimates for States, was incorporated into the design. A coverage improvement sample, composed of approximately 450 sample household units which represent 237,000 occupied mobile homes and 600,000 new construction housing units, was included in computing the estimates beginning in October 1978 in order to provide coverage of mobile homes and new construction units that previously had no chance for selection in the CPS sample. In January 1980, another supplemental sample of 9,000 households selected in 32 States and the District of Columbia was added to the existing sample. A sample reduction of about 6,000 units was implemented in May 1981. Beginning in January 1982, the sample was expanded by 100 households to provide additional coverage in counties added to SMSA's, which were redefined in 1973.

Beginning in April 1984, households sleected based on the 1980 census sample design are being introduced into the survey, but they are located in those 1970 design sample areas that will continue into the 1980 sampling frame. Hence, there is no change in the number of sample areas at this time. (See pp. 7-10 of the May 1984 issue for an overview of the introduction of the new sample.)

Table A provides a description of some aspects of the CPS sample design in use during the different data col-
lection periods. A more detailed account of the history of the CPS sample design appears in The Current Population Survey: Design and Methodology, Technical Paper No. 40, Bureau of the Census, or Concepts and Methods Used in Labor Force Statistics Derived From the Current Population Survey, Report 463 Bureau of Labor Statistics.

## ESTIMATING METHODS

Under the estimating methods used in the CPS, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. The estimation procedure involves weighting the data from each sample person. The basic weight, which is the inverse of the probability of the person being in the sample, is a rough measure of the number of actual persons that the sample person represents. In States supplemented in the 1978 and 1980 expansions, almost all sample persons within the sample area have the same basic weight, but the weight may differ across sample areas. The basic weight is the same for almost all sample persons in unsupplemented States. The basic weights are then adjusted for noninterview, and the ratio estimation procedure is applied.

1. Noninterview adjustment. The weights for all interviewed households are adjusted to the extent needed to account for occupied sample households for which no information was obtained because of absence, impassable roads, refusals, or unavailability of the respondents for other reasons. This adjustment is made separately by combinations of sample areas within each State and the District of Columbia, and, within these, for six groups-two race categories (white, and black and other) within three residential categories. For sample areas which are Standard Metropolitan Statistical Areas, (SMSA's), these residence categories are the central cities, the urban, and the rural balance of the SMSA's. For other sample areas, the residence categories are urban, rural nonfarm, and rural farm. The proportion of sample households not interviewed

Table A. Characteristics of the CPS sample, 1947 to date

| Time period | Number of sample areas | Households eligible |  | Households visited but not eligible |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Interviewed | Not interviewed |  |
| Aug. 1947 to Jan. 1954 | 68 | 21,000 | 500-1,000 | 3,000-3,500 |
| Feb. 1954 to Apr. 1956 | 230 | 21,000 | 500-1,000 | 3,000-3,500 |
| May 1956 to Dec. 1959 | ${ }^{1} 330$ | 33,500 | 1,500 | 6,000 |
| Jan. 1960 to Feb. 1963 | ${ }^{2} 333$ | 33,500 | 1,500 | 6,000 |
| Mar. 1963 to Dec. 1966 | 357 | 33,500 | 1,500 | 6,000 |
| Jan. 1967 to July 1971 | 449 | 48,000 | 2,000 | 8,500 |
| Aug. 1971 to July 1972 | 449 | 45,000 | 2,000 | 8,000 |
| Aug. 1972 to Dec. 1977 | 461 | 45,000 | 2,000 | 8,000 |
| Jan. 1978 to Dec. 1979 | 614 | 53,500 | 2,500 | 10,000 |
| Jan. 1980 to Apr. 1981 ............................................ | 629 | 62,200 | 2,800 | 12,000 |
| May 1981 to present .............................................. | 629 | 57,800 | 2,500 | 11.000 | coverage in each State and the District of Columbia.

Hawaii after statehood.
varies from 4 to 5 percent, depending on weather, vacations, etc.
2. Ratio estimates. The distribution of the population selected for the sample may differ somewhat, by chance, from that of the population as a whole, in such characteristics as age, race, sex, and residence. Since these characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the survey estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio estimates as follows:
a. First-stage ratio estimate. In the CPS, a portion of the 629 sample areas is chosen to represent other areas not in the sample; the remainder of the sample areas represent only themselves. The first-stage ratio estimation procedure was designed to reduce the portion of the variance resulting from requiring sample areas to represent nonsample areas. Therefore, this procedure is not applied to sample areas which represent only themselves. The procedure is performed at two geographic levels: First, by the four census regions (Northeast, North Central, South, and West), and second, for each of the 46 States which contains nonsample areas. Effective with January 1983 data, the procedure corrects for the differences that existed at the time of the 1980 census between the distribution by race and residence of the population in the sample areas and the known race-residence distribution in the portions of the census region or State represented by these areas. The regional adjustment is performed by metropolitannonmetropolitan residence and race, while the State adjustment is done by race only. Prior to January 1983, the State adjustment was also done by urban-rural status. At both the regional and the State levels, the race-residence categories were changed from white/nonwhite to black/nonblack. The residence categories at the State level of the estimation procedure were dropped because definitional differences between the 1970 census and the 1980 census made it impossible to continue using the same categories.
b. Second-stage ratio estimate. In this stage, the sample proportions of persons in specific categories are adjusted to the distribution of independent current estimates of the civilian noninstitutional population in the same categories. The second-stage ratio adjustment which is performed to further reduce variability of the estimates and to correct to some extent for CPS undercoverage relative to the decennial census, is carried out in two steps. In the first step, the sample estimates are adjusted within each State and the District of Columbia to an independent control for the population 16 years and over for the State. The second step is applied to all sample persons and is a weighting to nationwide in-
dependent population estimates within 68 age-sex-race groups. The entire second-stage adjustment procedure is iterated six times, each time beginning at the weights developed the previous time. This ensures that the sample estimates of the population for both State and national age-sex-race categories will be virtually equal to the independent population control totals. This secondstage adjustment procedure incorporates changes instituted in January 1982. The nature and effect of these changes are discussed in detail in "Revisions in the Current Population Survey Beginning in January 1982" in the February 1982 issue of Employment and Earnings.
The controls by State for the civilian noninstitutional population 16 years and over are an arithmetic extrapolation of the trend in the growth of this segment of the population from the April 1, 1980, census through the latest available July 1 estimate, adjusted as a last step to a current estimate of the U.S. population of this group. State estimates by age for July 1 are published annually in Current Population Reports, Series P-25. For a description of the methodology used in developing the State total, use Report 640 of that series. A description of the age estimates methodology are available on request from the Chief of the Population Division, U.S. Bureau of the Census; Washington, D.C. 20233.

Beginning with the January 1982 estimates, the independent national controls used for the age-sex-race groups in the final step of the second-stage ratio adjustment are prepared by carrying forward the April 1, 1980, total population by age, race, and sex, taking account of the subsequent aging of the population, fertility, mortality, and net immigration, and then subtracting the estimate for the institutional population and Armed Forces. The April 1, 1980, total population was computed by adding together the resident population, consistent with that published for the 1980 census in $A d$ vance Reports, Series PHC80-V, and the Armed Forces overseas, as compiled from Department of Defense reports.

Data on births and deaths between April 1, 1980, and the estimate date are based on tabulations of vital statistics for the resident population made by the National Center for Health Statistics and data on deaths of military personnel overseas from the Department of Defense. Estimates of net civilian immigration are based on data provided by the Immigration and Naturalization Service, the Department of Defense, the Office of Personnel Management, and the Puerto Rico Planning Board. The civilian noninstitutional population is derived by subtracting the Armed Forces and the institutional population for the estimate date from the total including Armed Forces overseas. The institutional population is computed by applying institutional proportions derived from the 1980 census to the total population, including Armed Forces overseas for the estimate date. All computations described above are
performed in cells defined by single year of age, race, and sex. The independent national control totals are then obtained by collapsing these cells into broader age groups for the population 16 years and older.
3. Composite estimate procedure. In deriving statistics for a given month, a composite estimating procedure is used which takes account of net changes from the previous month for continuing parts of the sample ( 75 percent), as well as the sample results for the current month. Almost all estimates of month-to-month change are improved by this procedure, and most estimates of levels are also improved, but to a lesser extent.

## Rounding of estimates

The sums of individual items may not always equal the totals shown in the same tables because of independent rounding of totals and components to the nearest thousand. Similarly, sums of percent distributions may not always equal 100 percent because of rounding. Differences, however, are insignificant.

## Reliability of the estimates

There are two types of errors possible in an estimate based on a sample survey-sampling and nonsampling. The standard errors provided primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration but do not measure any systematic biases in the data.

Nonsampling error. The full extent of nonsampling error is unknown, but special studies have been conducted to quantify some sources of nonsampling error in the CPS, as discussed below. The effect of nonsampling error should be small on estimates of relative change, such as month-to-month change. Estimates of monthly levels would be more severely affected by the nonsampling error.

Nonsampling errors in surveys can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness of respondents to provide correct information, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all sample households and all persons within sample households (undercoverage).

Nonsampling errors occurring in the interview phase of the survey have been studied by means of a reinterview program. This program is used to estimate various sources of error as well as to evaluate and control the work of the interviewers. A random sample of each interviewer's work is inspected through reinterview at regular intervals. The results indicate, among other things, that the data published from the CPS are subject
to moderate systematic biases. A description of the CPS reinterview program and some of the other results may be found in the Current Population Survey Reinterview Program, January 1961 through December 1966. Technical Paper No. 19, Bureau of the Census, U.S. Department of Commerce.

The effects of some components of nonsampling error in the CPS data can be examined as a result of the rotation plan used for the sample, since the level of the estimates varies by rotation group. A description of these effects appears in the "The Effects of Rotation Group Bias on Estimates from Panel Surveys,'" by Barbara A. Bailar, Journal of the American Statistical Association, Volume 70, No. 349, March 1975.

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Compared to the level of the decennial census, undercoverage is about 5 percent. It is known that the CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for men than for women, and larger for black, and other races combined than for whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the biases due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1980 census.

Additional information on nonsampling error in the CPS appears in "An Error Profile: Employment as Measured by the Current Population Survey," by Camilla Brooks and Barbara Bailar, Statistical Policy Working Paper 3, U.S. Department of Commerce, Office of Federal Statistical Policy and Standards; in "The Current Population Survey: An Overview," by Marvin Thompson and Gary Shapiro, Annals of Economic and Social Measurement, Vol. 2, April 1973; and in The Current Population Survey, Design and Methodology, Technical Paper No. 40, Bureau of the Census, U.S. Department of Commerce. This last document includes a comprehensive and up-to-date discussion of various sources of error, and describes attempts to measure them in the CPS.

Sampling error. The standard error is primarily a measure of sampling variability, that is, of the variation that occurs by chance because a sample rather than the entire population is surveyed. The sample estimate and its estimated standard error enable one to construct confidence intervals, ranges that would include the average of all possible samples with a known probability. For example, if all possible samples were selected, each of these surveyed under essentially the same general conditions and using the same sample design, and an estimate
and its estimated error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples.
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average of all possible samples.
3. Approximately 95 percent of the intervals from 2 standard errors below the estimate to 2 standard errors above the estimate would include the average result of all possible samples.

In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. First, the standard errors in this volume reflect the sample design and estimation procedures in effect prior to the expansions for State estimates. Thus, these standard errors may slightly overstate the standard errors applicable to the present design. Second, instead of computing an individual standard error for each estimate, generalized sets of standard errors were computed for various types of characteristics. This generalization yields more stable estimates of the standard errors. Consequently, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

Tables B and C show approximate standard errors for major employment status characteristics for monthly estimates and for changes for consecutive months. These standard errors are applicable to the level of the estimates in recent months.

Tables $\mathbf{D}$ through H provide generalized standard errors for monthly level and month-to-month change for estimated totals, unemployment rates, and percentages. Table I contains factors for use with table H for computing standard errors, as described below, for monthly level and month-to-month change for percentages. Standard errors for intermediate values not shown in the tables may be approximated by linear interpolation. The standard error for estimated changes from one month to the next is more closely related to the monthly level for the characteristic than to the size of the specific month-to-month change itself. Thus, in order to use the generalized standard errors for month-to-month change as given in the tables of standard errors, it is necessary to obtain the monthly estimate for the characteristic. It should be noted that the tables of standard errors for month-to-month change apply only to estimates of change between 2 consecutive months. Estimates of change for nonconsecutive months are subject to higher standard errors. Table J contains factors for use with tables D, F, H, and I to compute approximate standard
errors for levels, labor force participation rates, and percentages as pertaining to the year-to-year change of monthly estimates, quarterly averages, changes in quarterly averages, yearly averages, and changes in yearly averages. Note that standard errors for changes in quarterly and yearly estimates apply only to consecutive quarters and years. For years prior to 1967, the standard errors must be adjusted due to the differences in the sample size. For years prior to 1956, the standard errors should be multiplied by 1.50, and for the 1956-66 period, they should be multiplied by 1.22 . Table K provides generalized standard errors for quarterly estimates of persons and families for use with the CPS earnings data.

Standard errors for estimated totals. Tables D and E provide generalized standard errors for monthly totals and for month-to-month change. The figures given in these tables are to be used for the characteristics as indicated.

Illustration. Assume that in a given month the number of persons working a specific number of hours was $12,000,000$, an increase of 400,000 over the

Table B. Standard errors for major employment status categories
(in thousands)

previous month. Linear interpolation in the second column of table D shows that the standard error on an estimate of $12,000,000$ is about 159,000 . The 68 -percent confidence interval as shown by these data is from $11,841,000$ to $12,159,000$. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Recall that the standard error of a month-to-month change is primarily dependent on the size of the monthly estimate. Thus, using linear interpolation in the first column of table E , the standard error on a month-tomonth change of 400,000 , when the monthly level is approximately $12,000,000$, is about 118,000 .

Standard errors for rates and percentages. The reliability of an estimated unemployment rate or an estimated percentage, computed using sample data for both numerator and denominator, depends upon beth the size of the rate or percentage and the total upon which the rate or percentage is based. Estimated rates and percentages are relatively more reliable than the corresponding estimates of the numerator of the rates or percentages; this is particularly true for percentages of 50 percent or more. As a general rule, percentages are not published when the monthly base is less than 75,000 , the quarterly average base is less than 60,000 , or the annual average base is less than 35,000 .

Tables F and G show generalized standard errors for monthly level and month-to-month change for unemployment rates. Generalized standard errors for estimated monthly percentages and estimated month-tomonth change in percentages can be obtained through the use of the standard errors in table H and the factors
in table I. First obtain the standard error from table H for the specific percentage and base. The generalized standard error is then calculated by multiplying the standard error from table H by the appropriate factor from table I. When the numerator and denominator of the percentage are in different categories, use the factor indicated by the numerator of the percentage.

Illustration. Assume that in a given month 3.6 percent of a total of $90,771,000$ employed persons are employed in agriculture. The standard error on an estimate of 3.6 percent with a base of $90,771,000$ is obtained from table H ( 0.09 percent). The appropriate factor from table 1 for the numerator of the percentage, agricultural employment, is 1.26 . The generalized standard eiror on the estimated 3.6 percent is then approximately 0.09 x $1.26=0.1$ percentage point.

Standard errors for year-to-year change of monthly estimates, quarterly averages, changes in quarterly averages, yearly averages, and changes in yearly averages. The approximate standard errors of levels, rates, and percentages involving year-to-year change of monthly estimates, quarterly averages, changes in quarterly averages, yearly averages, and changes in yearly averages may be obtained by using table $\mathbf{J}$ ị̣ conjunction with the other tables. Standard errors for estimates of change are more closely related to the level of the estimate than to the size of the specific change. Thus, to obtain the standard error of an estimate of an average level, rate, or percentage, or an estimate of a change in level, rate, or percentage, it is first necessary to find the appropriate estimate of level. For an estimate
of an average level, rate, or percentage, find the standard error of this estimate. For an estimate of change in level, rate, or percentage, find the standard error of the average of the two estimates affecting the change. Then, after computing the standard error by treating these estimates as monthly estimates and using the procedures above, multiply this result by a suitable factor from table J to obtain the approximate standard error for the average or change.

Illustration. Suppose that one is interested in the year-to-year change of a monthly unemployment rate. Assume that for a certain month the unemployment rate is 6.9 percent, based on a total of $95,676,000$ in the civilian labor force, and that a year prior to this the unemployment rate was 6.1 percent, based on a total of $94,254,000$ in the civilian labor force for the month. First the standard error on the average of the two estimates, 6.5 percent with a base of $94,965,000$, is obtained from table $\mathrm{F}(0.12$ percentage point). The appropriate factor, then, from table J is 1.40 . The approximate standard error on the change of 0.8 percent is then given by $0.12 \times 1.40=0.17$ percentage point.

The approximate standard error of levels involving year-to-year change of quarterly estimates pertaining to CPS earnings data for persons and families may be obtained by using table K in conjunction with the following formula:

Standard
error of year-to-year change $=$

$$
\sqrt{\left(\begin{array}{c}
\text { Stand- } \\
\text { ard } \\
\text { error }
\end{array}\right)^{2}}+\underset{Y}{\left(\begin{array}{c}
\text { Stand } \\
\text { ard } \\
\text { error }
\end{array}\right)^{2}} \cdot \underset{2(\mathrm{P})}{\left(\begin{array}{c}
\text { Stand- } \\
\text { ard } \\
\text { error }
\end{array}\right)}\left(\begin{array}{c}
\text { Stand- } \\
\text { ard } \\
\text { error }
\end{array}\right)
$$

Where x is the estimate for one quarter and Y is the estimate for another quarter. The coefficient, $\mathbf{P}$, is a measure of the correlation between the estimates X and Y resulting from the presence of some of the same respondents in the sample for each estimate. For consecutive year-to-year changes of quarterly estimates, the values of P are .30 for persons (total, white, and black) and .35 for families (total, white, and black). The respective values for estimates of Hispanics are . 45 and .55.

Illustration. Assume that in a given quarter the number of women employed as full-time wage and salary workers was $27,000,000$ and in the same quarter a year later, their number had increased to $29,000,000$. Using linear interpolation in the eighth column of table K , the standard error of an estimate of $27,000,000$ is 216,000 ; for $29,000,000$ it is 221,000 . Using the above formula, the standard error of the $2,000,000$, year-toyear change is:
$\sqrt{(216,000)^{2}+(221,000)^{2}-2(.30)(216,000)(221,000)}$.
or about 259,000 .

# Establishment Data <br> (Tables B-1 through C.8) 

## COLLECTION

Payroll reports provide current information on wage and salary employment, hours, and earnings in nonagricultural establishments, by industry and geographic location. Historical statistics are published in Employment, Hours, and Earnings, United States, 1909-84, and Employment Hours and Earnings, States and Areas, 1939-82 and their annual supplements.

## Federal-State cooperation

Under cooperative arrangements, responding establishments report employment, hours, and earnings data to State agencies. State agencies mail the forms to the establishments and examine the returns for consistency, accuracy, and completeness. The States use the reported data to prepare State and area series and also send the reported data to the BLS (Washington Office) for use in preparing the national series. This avoids a duplicate reporting burden on establishments, and together with the use of similar estimating techniques at the national and State levels, promotes increased comparability between estimates.

## Shuttle schedules

Form bls 790-Report on Employment, Payroll, and Hours is the name of the data collection schedule. The collection agency returns the schedule to the respondent each month so that the next month's data can be entered on the space alotted for that month. This "shuttle" procedure assures maximum comparability and accuracy of reporting, since the respondent can see the figures that have been reported for previous months.
Form bls 790 provides for entry of data on the total number of full- and part-time workers on the payrolls of nonagricultural establishments and, for most industries, employment, payroll, and hours of production and related workers or nonsupervisory workers for the pay period which includes the 12th of the month.

## CONCEPTS

## Industrial classification

Establishments reporting on Form BLS 790 are classified into industries on the basis of their principal product or activity determined from information on annual sales volume. Since January 1980, this information is collected on a supplement to the quarterly unemployment insurance tax reports filed by employers. For an establishment making more than one product or engaging in more than one activity, the entire employment of the establishment is included under the industry indicated by the principal product or activity.

All data on employment, hours, and earnings for the Nation and for States and areas are classified in accordance with the 1972 Standard Industrial Classification Manual (SICM), Office of Management and Budget. The BLS tabulates and estimates statistics which distinguish between private and public establishments, thus maintaining continuity with previously published statistics for the private and government sector.

## Industry employment

Employment data, except those for the Federal Government, refer to persons on establishment payrolls who received pay for any part of the pay period which includes the 12th of the month. For Federal Government establishments, employment figures represent the number of persons who occupied positions on the last day of the calendar month. Intermittent workers are counted if they performed any service during the month.
The data exclude proprietors, the self-employed, unpaid volunteer or family workers, farm workers, and domestic workers. Salaried officers of corporations are included. Government employment covers only civilian employees; military personnel are excluded. Employees of the Central Inteiligence Agency and the National Security Agency are also excluded.
Persons on establishment payrolls who are on paid sick leave (when pay is received directly from the firm), on paid holiday, on paid vacation, or who work during a part of the pay period even though they are unemployed or on strike during the rest of the period are counted as employed. Not counted as employed are persons who are on layoff, on leave without pay, on strike for the entire period, or who were hired but have not yet reported during the period.

## Industry hours and earnings

Average hours and earnings data are derived from reports of payrolls and hours for production and related workers in manufacturing' and mining, construction workers in construction, and nonsupervisory employees in private service-producing industries.

Production and related workers include working supervisors and all nonsupervisory workers (including group leaders and trainees) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping, trucking, hauling, maintenance, repair, janitorial, guard services, product development, auxiliary production for plant's
own use (e.g., power plant), recordkeeping, and other services closely associaied with the above production operation.

Construction workers include the following employees in the construction division: Working supervisors, qualified craft workers, mechanics, apprentices, helpers, laborers, etc., engaged in new work, alterations, demolition, repair, maintenance, etc., whether working at the site of construction or working in shops or yards at jobs (such as precutting and preassembling) ordinarily performed by members of the construction trades.

Nonsupervisory employees include employees (not above the working supervisory level) such as office and clerical workers, repairers, salespersons, operators, drivers, physicians, lawyers, accountants, nurses, social workers, research aides, teachers, drafters, photographers, beauticians, musicians, restaurant workers, custodial workers, attendants, line installers and repairers, laborers, janitors, guards, and other employees at similar occupational levels whose services are closely associated with those of the employees listed.

Payroll covers the payroll for full- and part-time production, construction, or nonsupervisory workers who received pay for any part of the pay period which includes the 12 th of the month. The payroll is reported before deductions of any kind, e.g., for old-age and unemployment insurance, group insurance, withholding tax, bonds, or union dues; also included is pay for overtime, holidays, vacations, and sick leave paid directly by the firm. Bonuses (unless earned and paid regularly each pay period); other pay not earned in the pay period reported (e.g., retroactive pay); tips; and the value of free rent, fuel, meals, or other payment in kind are excluded. "Fringe benefits" (such as health and other types of insurance, contributions to retirement, etc., paid by the employer) are also excluded.

Hours cover the hours paid for during the pay period which includes the 12 th of the month for production, construction, or nonsupervisory workers. Included are hours paid for holidays, vacations, and for sick leave when pay is received directly from the firm.

Overtime hours covers hours worked by production or related workers for which overtime premiums were paid because the hours were in excess of the number of hours of either the straight-time workday or the workweek during the pay period which includes the 12th of the month. Weekend and holiday hours are included only if overtime premiums were paid. Hours for which only shift differential, hazard, incentive, or other similar types of premiums were paid are excluded.

A verage hourly and weekly earnings. Average hourly earnings are on a "gross" basis. They reflect not only changes in basic hourly and incentive wage rates but also such variable factors as premium pay for overtime and late-shift work and changes in output of workers paid on an incentive plan. They also reflect shifts in the number of employees between relatively high-paid and low-paid work and changes in workers' earnings in individual establishments. Averages for groups and divisions further reflect changes in average hourly earnings for individual industries.

Averages of hourly earnings differ from wage rates. Earnings are the actual return to the worker for a stated period of time; rates are the amount stipulated for a given unit of work or time. The earnings series do not measure the level of total labor costs on the part of the employer since the following are excluded: Irregular bonuses, retroactive items, payments of various welfare benefits, payroll taxes paid by employers, and earnings for those employees not covered under the production worker, construction worker, or nonsupervisory employee definitions.

Average weekly earnings estimates are derived by multiplying average weekly hours estimates by average hourly earnings estimates. Therefore, weekly earnings are affected not only by changes in average hourly earnings but also by changes in the length of the workweek. Monthly variations in such factors as proportion of part-time workers, stoppages for varying reasons, labor turnover during the survey period, and absenteeism for which employees are not paid may cause the average workweek to fluctuate.

Long-term trends of average weekly earnings can be affected by structural changes in the makeup of the work force. For example, persistent long-term increases in the proportion of part-time workers in retail trade and many of the services industries have reduced average work weeks in these industries and have affected the average weekly earnings series.

Average weekly hours. The workweek information relates to the average hours for which pay was received and is different from standard or scheduled hours. Such factors as unpaid absenteeism, labor turnover, parttime work, and stoppages cause average weekly hours to be lower than scheduled hours of work for an establishment. Group averages further reflect changes in the workweek of component industries.

A verage overtime hours. The overtime hours represent that portion of the average weekly hours which exceeded regular hours and for which overtime premiums were paid. If an employee were to work on a paid holiday at regular rates, receiving as total compensation his or her holiday pay plus straight-time pay for hours worked that day, no overtime hours would be reported.

Table L. Summary of methods for computing industry statistics on employment, hours, and earnings

| Employment, hours, and earnings | Basic estimating cell (industry, region, size, or region/size cell) | Aggregate industry level (division and, where stratified, industry) |
| :---: | :---: | :---: |
|  | Mon | data |
| All employees | All-employee estimate for previous month multiplied by ratio of all employees in current month to all employees in previous month, for sample establishments which reported for both months. ${ }^{1}$ | Sum of all-employee estımates for component cells. |
| Production or nonsupervisory workers, women employees | All-employees estimate for current month multiplied by (1) ratio of production or nonsupervisory workers to all employees in sample establishments for current month. (2) estimated ratio of women to all employees. ${ }^{2}$ | Sum of production or nonsupervisory worker estimates, or estimates of women employees. for component ceils. |
| Average weekly hours | Production or nonsupervisory worker hours divided by number of production or nonsupervisory workers. ${ }^{2}$ <br> Average, weighted by production or nonsupervisory worker employment. of the average weekly hours for component cells. |  |
| Average weekly overtime hours | Production worker overtime hours divided by number of production workers. ${ }^{2}$ | Average, weighted by production worker employment. of the average weekly overtime hours for component cells. |
| Average hourly earnings | Total production or nonsupervisory worker payroll divided by total production or nonsupervisory worker hours. ${ }^{2}$ | Average. weighted by aggregate hours, of the average hourly earnings for component cells. |
| Average weekly earnings | Product of average weekly hours and average hourly earnings. | Product of average weekly hours and average hourly earnings. |
|  | Annual a | rage data |
| All employees, women employees, and production or nonsupervisory workers | Sum of monthly estimates divided by 12. <br> Annual total of aggregate hours (production or nonsupervisory worker employment multiplied by average weekly hours) divided by annual sum of employment. | Sum of monthly estimates divided by 12 . <br> Annual total of aggregate hours for production or nonsupervisory workers divided by annual sum of employment for these workers. |
| Average weekly hours . . . . . . . . . . . . . . . . |  |  |
| Average weekly overtime hours | Annual total of aggregate overtime hours (production worker employment multiplied by average weekly overtime hours) divided by annual sum of employment. | Ansiual total of aggregate overtime hours for production workers divided by annual sum of employment for these workers. |
| Average hourly earnings | Annual total of aggregate payrolls (product of production or nonsupervisory worker employment by weekly hours and hourly earnings) divided by annual aggregate hours. | Annual total of aggregate payrolls divided by annual aggregate hours. |
| Average weekly earnings | Product of average weekly hours and average hourly earnings. | Product of average weekly hours and average hourly earnings. |

${ }^{1}$ The estimates are computed by multiplying the above product by bias adjustment factors, which compensate for the underrepresentation of newly formed enterprises and other sources of bias in the sample.
${ }_{2}$ The sample production-worker ratio, women-worker ratio, average weekly hours, average overtime hours. and average hourly earnings are modified by
a wedging technique designed to compensate for changes in the sample arising mainly from the voluntary character of the reporting. The wedging procedure accepts the advantage of continuity from the use of the matched sample and, at the same time, tapers or wedges the estimate toward the level of the latest sample average.

Since overtime hours are premium hours by definition, weekly hours and overtime hours do not necessarily move in the same direction from month to month; for example, ovetime premiums may be paid for hours in excess of the straight-time workday although less than a full week is worked. Diverse trends at the industry group level also may be caused by a marked change in hours for a component industry where little or no overtime was worked in both the previous and current months. In addition, such factors as stoppages, absenteeism, and labor turnover may not have the same influence on overtime hours as on average hours.

Railroads hours and earnings. The figures for Class I railroads (excluding switching and terminal companies) are based on monthly data summarized in the M-300 report of the Interstate Commerce Commission and relate to all employees except executives, officials, and staff assistants (ICC group I) who received pay during the month. Average hourly earnings are computed by dividing total compensation by total hours paid for. Average weekly hours are obtained by dividing total number of hours paid for, reduced to a weekly basis, by the number of employees, as defined above. Average weekly earnings are derived by multiplying average weekly hours by average hourly earnings.

Real earnings, or earnings in constant dollars, are calculated from the earnings averages for the current month using a deflator derived from the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W).

Average hourly earnings excluding overtime. Average hourly earnings excluding overtime premium pay are computed by dividing the total production worker payroll for the industry group by the sum of total production worker hours and one-half of total overtime hours. Prior to January 1956, these data were based on the application of adjustment factors to average hourly earnings (as described in the Monthly Labor Review, May 1950, pp. 537-40). Both methods eliminate only the earnings due to overtime paid for at $11 / 2$ times the straight-time rates. No adjustments are made for other premium payment provisions, such as holiday work, late-shift work, and overtime rates other than time and one-half.

Indexes of aggregate weekly hours. The indexes of aggregate weekly hours are prepared by dividing the current month's aggregate by the average of the 12 monthly figures for 1977. For basic industries, the hour aggregates are the product of average weekly hours and production worker or nonsupervisory worker employment. At all higher levels of industry aggregation, hour aggregates are the sum of the component aggregates.

Indexes of diffusion of changes in number of employees on nonagricultural payrolls. These indexes measure the percent of industries which posted increases in employment over the specified time span. The indexes are calculated from 185 seasonally adjusted employment series (two-digit nonmanufacturing industries and threedigit manufacturing industries) covering all nonagricultural payroll employment in the private sector. A more detailed discussion of these indexes appears in "Introduction of Diffusion Indexes," in the December 1974 issue of Employment and Earnings.

## ESTIMATING METHODS

The principal features of the procedure used to estimate employment for the establishment statistics are (1) the use of the "link relative" technique which is a form of ratio estimation; (2) periodic adjustment of employment levels to new benchmarks; and (3) the use of size and regional stratification.

## The "link relative" technique

From a sample composed of establishments reporting for both the previous and current months, the ratio of current month employment to that of the previous month is computed. This is called a "link relative." The estimates of employment (all employees, including production and nonproduction workers together) for the current month are obtained by multiplying the estimates for the previous month by these "link relatives." In addition, bias correction factors are applied to selected employment estimates each month. The size of the bias correction factors is determined from past benchmark comparisons. Beginning with data for April 1983, these factors are modified by changes in the sample link relatives for the most recent quarter. Other features of the general procedures are described in table L.

## Size and regional stratification

A number of industries are stratified by size of establishment and/or by region, and the stratified production or nonsupervisory worker data are used to weight the hours and earnings into broader industry groupings. Accordingly, the basic estimating cell for an employment, hours, or earnings series, as the term is used in the summary of computational methods in table L , may be a whole industry or a size stratum, a region stratum, or a size stratum of a region within an industry.

## Benchmark adjustments

Employment estimates are compared periodically with benchmarks (comprehensive counts of employment) for the various nonagricultural industries and appropriate adjustments are made as indicated. The industry estimates are currently projected from March 1983 levels. Normally, benchmark adjustments are made annually.

The primary sources of benchmark information are employment data, by industry, compiled quarterly by States agencies from reports of establishments covered under State unemployment insurance laws. These tabulations cover about 98 percent of employees on nonagricultural payrolls in the United States. Benchmark data for the residual are obtained from the records of the Social Security Administration, the Interstate Commerce Commission, and a number of other agencies in private industry or government.
The estimates for the benchmark month are compared with new benchmark levels, industry by industry. If revisions are necesary, the monthly series of estimates between benchmark periods are adjusted between the new benchmark and the preceding one, and the new benchmark for each industry is then carried forward progressively to the current month by use of the sample trends. Thus, under this procedure, the benchmark is used to establish the level of employment; the sample is used to measure the month-to-month changes in the level. A comparision of the actual amounts of revisions made at the time of the March 1983 benchmark adjustment is shown in table M.

Data for all months since the last benchmark to which the series has been adjusted are subject to revision. Revised data are published as soon as possible after each benchmark revision.

## THE SAMPLE

## Design

The sampling plan used in the Current Employment Statistics program is known as "sampling proportionate to average size of establishment." This design is an optimum allocation design among strata since the sampling variance is proportional to the average size of establishments. Under this type of design, large establishments fall into the sample with certainty. The size of the sample for the various industries is determined empirically on the basis of experience and of cost

Table M. Comparison of nonagricultural employment benchmarks and estimates for March 1983

| Industry | Benchmark | Estimate | Percent difference |
| :---: | :---: | :---: | :---: |
| Total | 88,208,000 | 88,172,000 | (') |
| Mining | 945,000 | 996,000 | -5.4 |
| Construction | 3,469,000 | 3,453,000 | . 5 |
| Manufacturing | 17,956,000 | 18.166.000 | -1.2 |
| Transportation and public utilities | 4,923,000 | 4,913,000 | . 2 |
| Wholesale trade | 5,156,000 | 5,145,000 | . 2 |
| Retail trade | 14,971,000 | 14,810,000 | 1.1 |
| Finance, insurance, and real estate | 5,361,000 | 5,359,000 | (') |
| Services | 19,262,000 | 19,279,000 | -. 1 |
| Government | 16,165,000 | 16,051,000 | . 7 |

Less than 0.05 percent.
considerations. In a manufacturing industry in which a high proportion of total employment is concentrated in relatively few establishments, a large percent of total employment is included in the sample. Consequently, the sample design for such industries provides for a complete census of the large establishments with only a few chosen from among the smaller establishments or none at all if the concentration of employment is great enough. On the other hand, in an industry in which a large proportion of total employment is in small establishments, the sample design calls for inclusion of all large establishments and also for a substantial number of the small ones. Many industries in the trade and services divisions fall into this category. To keep the sample to a size which can be handled by available resources, it is necessary to design samples for these industries with a smaller proportion of universe employment than is the case for most manufacturing industries. Since individual establishments in these nonmanufacturing divisions generally show less fluctuation from regular cyclical or seasonal patterns than do establishments in manufacturing industries, these smaller samples (in terms of employment) generally produce reliable estimates.

In the context of the BLS Current Employment Statistics program, with its emphasis on producing timely data at minimum cost, a sample must be obtained which will provide coverage of a sufficiently large segment of the universe to provide reasonably reliable estimates that can be published promptly and regularly. The present sample meets these specifications for most industries. With its use, the BLS is able to produce preliminary estimates each month for many industries and for many geographic levels within a few weeks after the reference period, and, at a somewhat later date, statistics in considerably greater industrial detail.

## Coverage

The BLS sample of establishment employment and payrolls is the largest monthly sampling operation in the field of social statistics. Table N shows the approximate proportion of total employment in each industry division covered by the group of establishments furnishing monthly employment data. The coverage for individual industries within the division may vary from the proportions shown.

## Reliability of the employment estimates

Although the relatively large size of the BLS establishment sample assures a high degree of accuracy, the estimates derived from it may differ from the figures that would be obtained if it were possible to take a complete census using the same schedules and procedures. As discussed under the previous section, a "link relative" technique is used to estimate employment. This requires the use of the previous month's estimate as

Table N. Approximate size and coverage of BLS employment and payrolls sample, March 1983'

|  $\vdots$ Number <br> Industry of estab <br> is  <br> lishments  |  |  |  |
| :---: | :---: | :---: | :---: |
| Total | 195,100 | 35.141,000 | 40 |
| Mining | 2.600 | 324.000 | 34 |
| Construction | 19,100 | 667,000 ${ }^{\text {i }}$ | 19 |
| Manufacturing. | 49,200 | 9,951,000 | 55 |
| Transportation and public utilities: |  |  |  |
| Railroad transportation (ICC). | 30 | 341.000 | 93 |
| Other transportation and public utilities: | 8.700 | $2,353.000$ | 52 |
| Wholesale trade | 16,800 | 820,000 | 16 |
| Retail trade | 30,800 | 2,660,000 | 18 |
| Finance, insurance, and real estate | 13.400 |  | 38 |
| Services | 33,100 | 4.291.000 | 22 |
| Government: |  |  |  |
| Federal ${ }^{2}$ | 4,800 | 2,731.000 | 100 |
| State. | 3,700 | 3,051,000 | 81 |
| Local | 12,900 | 5,912.000 | 61 |

Since a few establishments do not report payroll and hours information, hours and earnings estimates may be based on a slightly smaller sample than employment estimates.
${ }^{2}$ National estimates of Federal employment by agency are provided to BLS by the Office of Personnel Maragement. Detailed industry estimates for the Executive Branch, as well as State and area estimates of Federal employment, are based on a sample of 4,800 reports covering about 64 percent of employment in Federal establishments.
the base in computing the current month's estimate. Thus, small sampling and response errors may cumulate over several months. To remove this accumulated error, the estimates are usually adjusted annually to new benchmarks. In addition to taking account of sampling and response errors, the benchmark revision adjusts the estimates for changes in the industrial classification of individual establishments (resulting from changes in their product which are not reflected in the levels of estimates until the data are adjusted to new benchmarks). In fact, at the more detailed industry levels, particularly within manufacturing, changes in classification are the major cause of benchmark adjustments. Another cause of differences arises from improvements in the quality of the benchmark data. Table O presents the average percent revisions of the five most recent benchmarks for major industry divisions. Detailed descriptions of individual benchmark revisions are a valable from the Bureau upon request.

The hours and earnings estimates for basic estimating cells are not subject to benchmark revisions, although the broader groupings may be affected slightly by changes in employment weights. The hours and earnings estimates, however, are subject to sampling errors which may be expressed as relative errors of the estimates. (A relative error is a standard error expressed as a percent of the estimate.) Relative errors for major industries are presented in table O and for individual industries with the specified number of employees in table $P$. The chances are about 2 out of 3 that the hours and earnings estimates from the sample would differ by a
smaller percentage than the relative error from the averages that would have been obtained from a complete census.

One measure of the reliability of the employment estimates for individual industries is the root-meansquare error (RMSE). The measure is the standard deviation adjusted for the bias in estimates:

```
RMSE = \sqrt{}{(Standard Deviation)}\mp@subsup{}{}{2}+(\mathrm{ Bias)'}
```

If the bias is small, the chances are about 2 out of 3 that an estimate from the samle would differ from its benchmark by less than the root-mean-square error. The chances are about 19 out of 20 that the difference would be less than twice the root-mean-square error.

Approximations of the root-mean-square errors (based on the most recent benchmark revisions) of differences between final estimates and benchmarks are presented in table $P$.

For the two most recent months, estimates of employment, hours, and earnings are preliminary and are so footnoted in the tables. These figures are based on less than the total sample and are revised when all the reports in the sample have been received. Table $Q$ presents root-mean-square errors of the amounts of revisions that may be expected between the preliminary and final levels of employment and preliminary and final month-to-month changes. Revisions of preliminary hours and earnings estimates are normally not greater than 0.1 of an hour for weekly hours and 1 cent for hourly earnings.

## STATISTICS FOR STATES AND AREAS

State and area employment, hours, and earnings data
Table O. Average benchmark revision in employment estimates and relative errors for average weekly hours and average hourly earnings by industry
(In percent)

| Industry | Average : benchmark revision in estimates of employment ${ }^{1}$ | Average weekly hours | ive <br> $\mathrm{s}^{2}$ <br> Average hourly earnings |

Table P. Root-mean-square errors of differences between benchmarks and estimates of employment and average relative errors for average weekly hours and average hourly earnings

[^40]are collected and prepared by State agencies in cooperation with BI.S. The area statistics relate to metropolitan areas. Definitions for all areas are published each year in the issue of Employment and Earnings that contains State and area annual averages (usually the May issue). Changes in definitions are noted as they occur. Additional industry detail may be obtained from the State agencies listed on the inside back cover of each issue. These statistics are based on the same establishment reports used by bis for preparing national estimates. For employment, the sum of the State figures may differ slightly from the equivalent official U.S. totals on a national basis, because some States have more recent benchmarks than others and because of the effects of

Table Q. Errors of preliminary employment estimates

| Industry | Root-mean-square error of- |  |
| :---: | :---: | :---: |
|  | Monthly level | Month-to-month change |
| Total nonagricultural employment ...... | 114.600 | 105.000 |
| Goods-producing | 39,600 | 34,300 |
| Mining | 5.500 | 5.100 |
| Construction | 22.000 | 18,200 |
| Manufacturing. | 29.000 | 28.500 |
| Durable two-digit industries. | 5,400 | 5.200 |
| Nondurable two-digit industries. | 3.900 | 3.900 |
| Service-producing. | 93.600 | 91.500 |
| Transportation and public utilities | 13.400 | 14,000 |
| Wholesale trade | 9,000 | 8.300 |
| Retail trade | 42,600 | 30,100 |
| Finance, insurance, and real estate | 9,300 | 8,200 |
| Services | 34,500 | 28.000 |
| Government | 71,300 | 62.800 |

NOTE: Data at the division level are based on differences from January 1978 through December 1983. Two-digit industry data are based on differences from January 1982 through December 1983
differing industrial and geographic stratification.
For the States and the areas shown in the $B$ and $C$ sections of this periodical, all the annual average data for the detailed industry statistics currently published by each cooperating State agency are presented in a summary volume published annually by the BLS.

## Productivity Data (Tables C-9 through C-11)

## COLLECTION

Productivity data are compiled by the Bureau of Labor Statistics from establishment data and from estimates of compensation and gross national product supplied by the U.S. Department of Commerce and the Federal Reserve Board.

## CONCEPTS

Hours of wage and salary workers in nonagricultural establishments refer to hours paid for all employees-production workers, nonsupervisory workers, and salaried workers.

Output is the constant-dollar market value of final goods and services produced in a given period. Indexes of output per hour of all persons measure changes in the volume of goods and services produced per paid hour of labor input.

Compensation per hour includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. The data also in-
clude an estimate of wages, salaries, and supplementary payments for the self-employed, except for nonfinancial corporations, in which there are no self-employed.

Real compensation per hour is compensation per hour adjusted to elimate the effect of changes in the Consumer Price Index for All Urban Consumers (CPI-U).

Unit labor costs measure the labor compensation cost required to produce one unit of output and are derived by dividing compensation per hour by output per hour.

Unit nonlabor payments include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current-dollar gross national product and dividing by output. In these tables, unit nonlabor costs contain all the components of unit nonlabor payments except unit profits.

Unit profits include corporate profits and inventory valuation adjustments per unit of output.

The implicit price deflator is derived by dividing the current-dollar estimate of gross product by the
constant-dollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

## NOTES ON THE DATA

For the business sector and the nonfarm business sector, these indexes relate to the gross domestic product less household and institutions, owner-occupied housing, and statistical discrepancy. For the nonfinancial corporate sector, the indexes refer to the gross domestic product of nonfinancial corporate business.

Manufacturing output data are supplied by the

Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly measures have been adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics. Historical statistics for most productivity measures appear in Trends in Multifactor Productivity, 1948-81, BLS Bulletin 2178. Additional information may be obtained from the Office of Productivity and Technology (202 523-9261).

# State and Area Labor Force Data (D table) 

## FEDERAL.STATE COOPERATIVE PROGRAM

Labor force and unemployment estimates for States, labor market areas (LMA's), and other areas covered under Federal assistance programs are developed by State employment security agencies under a FederalState cooperative program. The local unemployment estimates which are derived from standardized procedures developed by BLS are the basis of determining eligibility of an area for benefits under Federal programs such as the Job Training Partnership Act and the Public Works and Economic Development Act.

Annual average data for the States and areas shown in table D are published in Employment and Earnings (usually the May issue). For regions, States, selected metropolitan areas, and central cities, annual average data classified by selected demographic, social, and economic characteristics are published in the BLS bulletin, Geographic Profile of Employment and Unemployment.

Labor force and unemployment estimates for counties, cities, and other small areas have been prepared for administration of various Federal economic assistance programs and may be ordered from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. The report 'Employment and Unemployment in States and Local Areas" is published monthly through GPO and is available on microfiche only on a subscription basis.

## ESTIMATING METHODS

The civilian labor force and unemployment estimates in 10 large States: New York, California, Illinois, Ohio, New Jersey, Pennsylvania, Michigan, Texas, Massachusetts, and Florida; and two areas: Los Angeles-Long Beach metropolitan area and New York City, are sufficiently reliable to be used directly from the CPS. For a description of the CPS concepts see "Household Data," above.

Monthly labor force and unemployment estimates in the remaining 40 States, District of Columbia, and 253 labor market areas are prepared in several stages. The civilian labor force is the sum of the employment and unemployment levels, which are estimated in accordance with the BLS Manual for Developing Local Area Unemployment Statistics.

1. Preliminary estimate-employment: The total civilian employment estimate is based on data from the survey of establishments which produces an estimate of payroll employment. This place-of-work estimate must be adjusted to refer to place of residence as used in the CPS. Factors for adjusting from place of work to place of residence have been developed for the several categories of employment on the basis of employment relationships which existed at the time of the 1970 decennial census. These factors are applied to the payroll employment estimates for the current period to obtained adjusted employment estimates, to which are added estimates for employment not cover by UI.
2. Preliminary estimate-unemployment: In the current month, the estimate of unemployment is an aggregate of the estimates for each of three building block categories: (1) Persons who were previously employed in industries covered by State unemployment insurance (UI) laws; (2) those previously employed in industries not covered by these laws; and (3) those who were entering the civilian labor force for the first time or reentering after a period of separation. This is referred to below as the UI- based estimate.

An estimate for those previously employed in covered industries is derived from a count of current employment insurance claimants, plus estimates of claimants whose benefits have been exhausted, those persons disqualified from receiving benefits for nonmonetary reasons (because they quit, were discharged for cause,
etc., but would otherwise have been eligible), and person who either filed claims late or not at all.

The estimate of those previously employed in industries not covered by UI is derived by applying to the employment estimate for each noncovered industry or class of worker subgroup in the State, the ratio of covered unemployment to covered employment weighted by factors reflecting national historical relationships.

For the third category, new entrants and reentrants into the labor force, a composite estimate is developed from equations that relate the total entrants into the labor force to the experienced unemployed and the experienced labor force. For each month, the estimate of entrants into the labor force is a function of: (a) the month of the year; (b) the level of the experienced unemployed; (c) the level of the experienced labor force; and (d) the proportion of the working age population that is considered "youth." The composite estimate of total entrants is defined as:

$$
\begin{aligned}
& \mathrm{U}=\mathrm{A}(\mathrm{X}+\mathrm{E})+\mathrm{BX} \text {, where } \\
& U=\text { total entrant unemployment } \\
& E=\text { total civilian employment } \\
& X=\text { total experienced unemployment } \\
& \mathrm{A}, \mathrm{~B}=\text { synthetic factors incorporating } \\
& \text { seasonal variation and an assumed } \\
& \text { relationship between the proportion of } \\
& \text { youths in the working population and the } \\
& \text { historical relationship of entrants to the } \\
& \text { experienced unemployed ( } B \text { factor) or the } \\
& \text { experienced labor force (A factor). }
\end{aligned}
$$

3. Correction factors for employment and unemployment are then applied at the State level of the UI-based estimates obtained above for each of the 40 States and the District of Columbia. These correction factors are based on the ratio of the CPS to the UI-based estimates for the 6 -month period ending in the current month (e.g. a 6-month moving average).
4. Substate adjusiment for additivity. Independent estimates of employment and unemployment are prepared for the State (obtained directly from the CPS in the 10 large States or by the Ui-based method in the remaining States), and labor market areas (LMA's) within the State). The total of the geographic areas in the LMA's exhausts the geographic boundaries of the State. A proportional adjustment is applied to all sub-state LMA estimates to ensure that the sub-state estimates of employment and unemployment add to the independent State totals. In California and New York, which aiso have sub-state areas taken directly from the CPS, the additivity adjustment for the reamining areas is applied to the State total minus the direct CPS area.
5. Benchmark correction procedures. Once each year monthly estimates prepared by the State employment security agencies using UI-based estimating procedures are adjusted, or benchmarked, by BLS to the annual average CPS estimates for the 40 States and the District of Columbia for which monthly CPS estimates are not available. This adjustment is necessary because the State-prepared estimates are not as reliable as the CPS annual averages due to differences in the State UI laws, the structual limitations of the UI-based estimating method, and errors in the UI data.

The benchmarked estimates are produced in three stages. First, the monthly UI-based estimates are adjusted by the ratio of the CPS to the UI-based annual averages. Second, the difference between the ratio of annual averages for two consecutive years is wedged into the monthly estimates in order to minimize the disturbance to the original series. Finally, the third stage estimates are forced into agreement with CPS annual averages. In the 10 States which use CPS estimates monthly, no benchmark correction is required, as the average of the 12 monthly State CPS estimates will equal CPS annual averages.

## Seasonal Adjustment

Over the course of a year, the size of the Nation's labor force, the Ievels of employment and unemployment, and other measures of labor market activity undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make it easier to observe the cyclical and other nonseasonal movements in the series. In evaluating
changes in a seasonally adjusted series, it is important to note that seasonal adjustment is merely an approximation based on past experience. Seasonally adjusted estimates have a broader margin of possible error than the original data on which they are based, since they are subject not only to sampling and other errors but are also affected by the uncertainties of the seasonal adjustment process itself. Seasonally adjusted series for selected labor force and establishment-based data are published regularly in Employment and Earnings.
The seasonal adjustment program used for these series is an adaptation of the standard ratio-to-moving
average method. It provides for "moving" adjustment factors to take account of changing seasonal patterns. A detailed description of the method is given in The $X-11$ Variant of the Census Method II Seasonal Adjustment Program, Technical Paper No. 15, Bureau of the Census (1967).

Beginning in January 1980, BLS introduced two major modifications in the seasonal adjustment methodology for data from the household survey. First, the data are being seasonally adjusted with a new procedure called X-11 ARIMA, which was developed at Statistics Canada as an extension of the existing standard X-11 method. A detailed description of the procedure appears in The X-11 ARIMA Seasonal Adjustment Method, by Estela Bee Dagurn, Statistics Canada Cataiogue NO. 12-564E, February 1980. The X-11 procedure was originally developed at the Bureau of the Census and had been used by the BLS to seasonally adjusted labor force series since 1973. Tests have shown that use of the X-11 ARIMA procedure, which places more emphasis on recent data, provides better seasonal adjustments than does the $\mathrm{X}-11$ method alone.

The second change is that seasonal adjustment factors are calculated for use during the first 6 months of the year rather than for the entire year. In July of each year, BLS calculates and publishes in Employment and Earnings a set of seasonal adjustment factors for use in the second half, based on the experience through June. Revisions of historical data for the most recent 5 years are made at the beginning of each calendar year. However, as a result of the revisions to the estimates for 1970-81 based on 1980 census population counts, revisions to seasonally adjusted series in early 1982 were carried back to 1970.

All labor force and unemployment rate statistics, as well as the major employment and unemployment estimates, are computed by aggregating independently adjusted series. For example, for each of the three major labor force components-agricultural employment, nonagricultural employment, and unemployment-data for four sex-age groups (men and women under and over 20 years of age) are separately adjusted for seasonal variation and are then added to derive seasonally adjusted total figures. The seasonally adjusted figure for the labor force is the sum of eight seasonally adjusted civilian employment components, plus the resident Armed Forces total (not adjusted for seasonality), and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the overall unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the labor force. Because of the independent seasonal adjustment of various series, components will not necessarily add to totals.

Revised seasonally adjusted data for selected labor force series based on the experience through December
1984. new seasonal adjustment factors to be used to calculate the civilian unemployment rate for the first 6 months of 1985, and a description of the current seasonal adjustment methodology are published in the January 1985 issue of Employment and Earnings. Revised seasonally adjusted data covering the 1980-84 revision period for a broader range of labor force series are published in the February 1985 issue of this publication.

Beginning in July 1980, the BLS also uses the X-11 ARIMA methodology in seasonally adjusting the establishment data, which previously had been computed using the BLS Seasonal Factor Method. All series are seasonally adjusted using the multiplicative models under X-11 ARIMA. Seasonal adjustment factors used in calculating the current year's estimates are based on actual data through March 1984 and projected data through March 1985. The ARIMA model options for projecting the data series for 1 year ahead have been used in seasonally adjusting the establishment series since June 1981.

Seasonal adjustment factors are directly applied to the component levels. Seasonally adjusted totals for most of these series are then obtained by taking a weighted average of the seasonally adjusted data for the component series. Seasonally adjusted average weekly earnings are the product of seasonally adjusted average hourly earnings and seasonally adjusted average weekly hours.

Average weekly earnings in constant dollars, seasonally adjusted, are obtained by dividing average weekly earnings, seasonally adjusted, by the seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W), and multiplying by 100 . Indexes of aggregate weekly hours, seasonally adjusted, are obtained by multiplying average weekly hours, seasonally adjusted, by production or nonsupervisory workers, seasonally adjusted, and dividing by the 1977 base. For total private, total goods-producing, total private service-producing, wholesale trade, retail trade, manufacturing, and durable and nondurable goods industries, the indexes of aggregate weekly hours, seasonally adjusted, are obtained by summing the aggregate weekly hours, seasonally adjusted, for the appropriate component industries and dividing by the 1977 base.

Seasonally adjusted data are not published for a number of series characterized by small seasonal components relative to their trend-cycle and/or irregular components. These failed or unsatisfactory seasonally adjusted series are used in the aggregation to broader level seasonally adjusted series
Beginning in June 1983, seasonal adjustment factors for Federal Government employment are derived from unadjusted data which include Christmas temporary workers employed by the Postal Service. In earlier years the number of these workers was substantial, and at
times varied greatly from year to year, based on administrative decisions of the Postal Service. Hence, it was considered desirable to exclude this group from the unadjusted data upon which the seasonal adjustment factors were based. In the past several years, the number of these workers has decreased to the point where their presence has no impact on seasonal adjustment. Temporary census takers for the 1980 decennial census are
removed prior to the calculation of seasonal adjustment factors for Federal Government employment.

The revised seasonally adjusted series for the establishment data reflect experience through March 1984. Seasonal adjustment factors to be used for current adjustment appear in the June 1984 issue of Employment and Earnings.
