In this issue: Establishment data adjusted
to new benchmarks
Revised 1991 annual averages for national establishment survey data

## U.S. DEPARTMENT OF LABOR <br> Lynn Martin, Secretary

## BUREAU OF LABOR STATISTICS

E\&E-Employment and Earnings (ISSN 0013-6840), is prepared in the Office of Employment and Unemployment Statistics in collaboration with the Office of Publications and Special Reports. The data are collected by the Bureau of the Census (Department of Commerce) and State employment security agencies, in cooperation with the Bureau of Labor Statistics. A brief description of the cooperative statistical programs of the BLS with these agencies is presented in the Explanatory Notes. The State agencies are listed on the inside back cover.

Employment and Earnings may be ordered from: New Orders, Superintendent of Documents, P.O. Box 371954, Pittsburgh, PA 15250-7954. Phone (202) 783-3238. Subscription price per year $\$ 31$ domestic and $\$ 38.75$ foreign. Single copy $\$ 10$ domestic and $\$ 12.50$ foreign. Prices are subject to change by the U.S. Government Printing Office.

Correspondence concerning subscriptions, including address changes and missing issues, should be sent to the Superintendent of Docurments, U.S. Government Printing Office, Washington, DC 20402. Phone (202) 512-2303. POSTMASTER: Send address changes to Employment and Earnings, U.S. Government Printing Office, Washington, DC 20402.

Communications on material in this publication should be addressed to: Editors, Employment and Earnings, Bureau of Labor Statistics, Washington, DC 20212. Specific questions concerning the data in this publication should be directed as follows: Household data, (202) 606-6373 or 6378; national establishment data, 606-6555; State and area establishment data, 606-6559; productivity data, 606-5606; and State and area labor force data, 606-6392.

Second class postage paid at Washington, DC, and at additional mailing addresses.

Information in this publication will be made available to sensory impaired individuals upon request. Voice phone (202) 606-STAT; TDD phone: (202) 606-5897; TDD message referral phone: 1-800-326-2577.

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission.

## Employment and Earnings

Editors: Gloria Peterson Green, Eugene H. Becker

## Editors' Note

Beginning with this issue, national estimates of employment, hours, and earnings from the monthly survey of business establishments have been revised to reflect March 1991 benchmarks (comprehensive counts of employment) and updated seasonal adjustment factors which incorporate the experience through March 1992. As a result, unadjusted series beginning April 1990 and seasonally adjusted series beginning January 1987 are not comparable with those previously published.

The article beginning on page 6 discusses the effects of the revisions and provides new seasonal adjustment factors to be used to calculate establishment-based estimates for May-October 1992. Revised current data appear in tables B-1 through B-7 and C-1 through C-7. Revised historical data will be published in a forthcoming supplement to Employment and Earnings.

## Employment and Unemployment Developments, May 1992

Unemployment rose in May, as the labor force continued its rapid expansion of recent months, and payroll employment edged up. The Nation's jobless rate, which had shown little change over the prior 3 months, rose by 0.3 percentage point to 7.5 percent in May.
Nonfarm payroll employment increased by 68,000 in May, continuing the slow upward trend evident since the beginning of the year. Total employment, as estimated through the household survey, was unchanged in May, following large gains over the prior 2 months.

## Unemployment

The number of unemployed persons increased by 349,000 to 9.5 million in May, and the unemployment rate rose to 7.5 percent, the highest level since August 1984. The rate had been 7.3 percent in both February and March and 7.2 percent in April. (See table A-33.)
The rise in unemployment occurred among youth (16to 24 -year-olds) and men 25 years and over. The jobless rate for youth rose by a full percentage point to 14.5 percent in May, and the rate for men 25 years and over increased from 6.2 to 6.5 percent. The rate for women 25 and over, at 5.6 percent in May, was little changed over the month. Jobless rates for whites ( 6.5 percent), blacks ( 14.7 percent), and Hispanics ( 11.3 percent) were up in May. (See tables A-33, A-34, and A-38.)
There were increases in both the number of persons who had recently become unemployed as well as those who had been jobless for several months. The number unemployed for fewer than 5 weeks rose by 215,000 in May, reaching 3.4 million. The number jobless for 15 weeks or longer, which had declined in April, rose by 343,000 in May to 3.4 million, the highest level since November 1983; most of this increase occurred in the 6 months and over group. Both the mean and median duration, at 18.3 and 9.0 weeks, respectively, rose in May and were at their highest levels since May 1984. (See table A-40.)
The number of unemployed who had lost their last jobs rose by 333,000 in May to 5.5 million, reversing the declines of March and April. The number of persons limited to working part time for economic reasons-sometimes referred to as the partially unemployed-which had been declining since the beginning of the year, increased by 252,000 to 6.5 million in May. (See tables A-35 and A-41.)

## Total employment and the labor force

Following substantial increases in both March and April, total employment held steady in May at 117.7 million. The employment-population ratio (the percentage of the population that is employed) was about unchanged at 61.5 percent. (See table A-33.)

The civilian labor force rose by 331,000 in May, reaching 127.2 million. Labor force growth-which had been anemic during most of the recession-has been very strong since late last year, averaging about 300,000 a month since November. Nearly half of the May increase was among 16to 24 -year-old youth. The labor force participation ratethe percentage of the working-age population that is either employed or unemployed-rose 0.2 percentage point to 66.5 percent in May; this was 0.7 percentage point higher than last November. (See table A-33.)

## Industry payroll employment

Nonfarm payroll employment continued its modest upward trend of recent months, edging up by 68,000 in May. Since January, the number of nonfarm jobs has grown by 350,000. (See table B-4.)

Employment in the service-producing sector grew for the sixth consecutive month in May, with an increase of 76,000 . The services industry itself added 109,000 jobs, its largest single-month gain since March 1990. Business services accounted for 39,000 of this increase, continuing its strong upward trend of recent months. Employment in the health services industry continued its long-term increase with a gain of 20,000 in May. Retail trade lost 44,000 jobs, after an increase of 83,000 in April, and has shown no clear employment trend since January. Finance continued to grow, adding 11,000 jobs.

In the goods-producing sector, total manufacturing employment was little changed in May. Most industries within manufacturing also showed little change; there was continued weakness in the defense-dependent transportation equipment and electronic equipment industries and small job gains in furniture and rubber and plastics. An employment increase in machinery resulted solely from a return of striking workers. Construction has still failed to generate any substantial job growth, and mining lost another 5,000 jobs, all of them in oil and gas extraction.

## Weekly hours

The average workweek for production or nonsupervisory workers on private nonfarm payrolls edged up by a tenth of an hour to 34.5 hours, following an identical decline in the prior month. The average factory workweek rose two-tenths of an hour to 41.3 hours; this was its highest level since October 1966. Average overtime for factory workers, which posted its fourth consecutive monthly increase, was 4.0 hours, a level which has not been exceeded since April 1973. (See table C-5.)

The index of aggregate weekly hours of private production or nonsupervisory workers increased by 0.5 percent to $121.5(1982=100)$ in May, after seasonal adjustment. The
manufacturing index also rose by 0.5 percent, to 103.4; this index has been on a steady upward trend over the past 6 months. (See table C-6.)

## Hourly and weekly earnings

Average hourly earnings of private production or nonsupervisory workers edged up by 0.3 percent to $\$ 10.56$, seasonally adjusted. Average weekly earnings increased by 0.6 percent to $\$ 364.32$. Prior to seasonal adjustment, average hourly earnings rose by 1 cent and average weekly earnings were up by $\$ 2.45$. Over the year, average hourly earnings increased by 2.5 percent and average weekly earnings by 3.4 percent. (See tables C-1 and C-7.)

# BLS Establishment Estimates Revised to March 1991 Benchmarks 

Patricia M. Getz

With the release of data for May 1992, the Bureau of Labor Statistics introduced its annual revision of national estimates of employment, hours, and earnings from the monthly sample survey of nonfarm establishments. Each year, the sample estimates are adjusted to universe counts of employment, known as benchmarks. Benchmarks are derived principally from employment data reported on unemployment insurance (UI) tax reports that virtually all employers file with State employment security agencies. The most recently revised data on employment, hours, and earnings incorporate March 1991 benchmarks and affect unadjusted series from April 1990 forward.
In keeping with its usual practice regarding the introduction of new benchmarks, the Bureau has also revised all seasonally adjusted series for the previous 5 -year period, and has introduced new seasonal adjustment factors to use for adjusting data in the months ahead. Additionally, BLS is publishing employment, hours, and earnings data for 19 more services industries as part of an initiative to expand the publication of data for the service-producing sector. Publishing these data extends the detail but does not affect totals and subtotals for industry divisions or groups. Text table A shows some characteristics of these industries.

## Summary of the revisions

The March 1991 benchmark level for total nonfarm employment was $107,507,000$. This was 640,000 or 0.6 percent below the corresponding sample-based estimate and resulted in the most significant benchmark revision in over a decade.
New estimates have been computed for each month since March 1991, based on the new benchmark levels. On a seasonally adjusted basis, the monthly revision ranged from -558,000 in March 1991 to -788,000 in October 1991, reflecting both the downward benchmark adjustment and the computation of new seasonal adjustment factors. Table 1 shows the extent of the revisions between January 1991 and February 1992 in both level and change, through a comparison of seasonally adjusted monthly data as previously published and as revised.

Table 2 summarizes the March 1991 revisions (not seasonally adjusted) by industry. Downward adjustments

[^1] Monthly Industry Employment Statistics, Bureau of Labor Statistics.
were made to all major industry divisions except manufacturing. The goods-producing sector of the economy had virtually no net change in employment, but the serviceproducing sector had a sizable decrease.
In the goods-producing sector, the overall upward revision of less than 0.05 percent resulted from slightly larger but offsetting errors among the major divisions within the sector. Mining and construction were both revised down-

[^2]ward, but the magnitude of the revisions in each was small compared to other recent benchmarks. (See table 3.) Manufacturing experienced a small upward revision ( 0.1 percent), attributable to corrections at the subdivision levels: Durable goods was revised upward by 0.4 percent; nondurable goods was revised down by 0.3 percent. Sizable adjustments were required in both transportation equipment ( 35,000 , or 1.9 percent) and lumber and wood products ( $-19,000$, or -2.9 percent).
Revisions in the service-producing sector accounted for nearly all of the disparity between the March 1991 nonfarm employment benchmark and its corresponding estimate; most of the revision occurred in the services division ( $-437,000$, or -1.6 percent). This large downward revision in services followed several years of small upward adjustments. Among services industries, business services had one of the most significant revisions; the estimate was adjusted downward by 216,000 ( -4.4 percent). Most of the services benchmark revision, however, actually resulted from industry coding corrections in the universe data which shifted employment from services into other sectors. These corrections, known as noneconomic code changes, are more fully explained in the section on benchmark methodology.

Other notable downward revisions occurred in transportation ( 52,000 , or 1.5 percent), eating and drinking places ( 68,000 , or 1.1 percent), and finance ( 75,000 , or 2.3 percent).

## Why estimates differ from benchmarks

A benchmark revision is defined as the difference between the benchmark level established for a given March and the previously published sample-based estimate for that same month. The overall accuracy of the Current Employment Statistics (CES) or establishment survey is often gauged by the size of this difference. Some analysts consider the benchmark revision a proxy for total survey error, presuming the universe-based benchmark is without error. The unemployment insurance counts, however, are administrative data that reflect employer recordkeeping practices and different State laws and procedures. The benchmark revision is thus more precisely interpreted as the difference between two independently derived job counts, each subject to its own error sources.

Like any sample survey, the establishment survey is subject to two sources of error, sampling error and nonsampling error. Sampling error occurs any time a sample is used to make inferences about a population. The magnitude of sampling error, or variance, relates directly to sample size and the percentage of the universe covered by that sample. The overall employment coverage in the monthly survey now stands at slightly over one-third of the uni-verse-very high by usual sampling standards. This coverage implies a very small sampling error, at the total nonfarm employment level.

Both the universe counts and the establishment survey estimates are subject to nonsampling errors common to all surveys-coverage, response, and processing errors. The error structures for both the CES survey and the UI universe are complex. Still, the two programs generally produce very consistent total employment figures, each validating the other. Over the past decade, annual benchmark revisions at the total nonfarm level have averaged 200,000 ( 0.2 percent), with a range from 0 to 500,000 ( 0.5 percent).
Sources of the 1991 benchmark revision. The benchmark revision for March 1991, 0.6 percent, was considerably above the previous 10 -year average and slightly beyond its value in the recent past. BLS announced the potential size of this revision prior to full publication of the revised data and it has received considerable attention, because it indicates a deeper recession than the monthly establishment survey estimates previously measured. Accordingly, BLS has carefully analyzed this revision and researched the major potential sources of differences between the sample survey and universe counts.

Overall characteristics of the revision. By definition, a discrepancy in employment trends as measured by the UI universe and establishment survey between April 1990 and March 1991 made the large benchmark revision necessary. Although a full benchmark is constructed only for March of each year, raw universe employment counts are available monthly, on a lagged basis, and can be compared to survey estimates for each month. Tracing both monthly sample-based and universe employment figures since the March 1990 benchmark revealed that the 640,000 downward revision was primarily attributable to a sudden, sharp drop in the universe employment counts for a single month, January 1991, a drop which was not fully replicated in the sample-based estimates.

In other words, the over-the-month changes-in the two surveys prior to the benchmark period-for April through December 1990 tracked closely. Subsequently, for February through September 1991 (the latest available preliminary universe data), trends in the two surveys again showed differences well within normal historical ranges.

Although the divergence was specifically attributable to January, the divergence itself did not trace to any specific industry, size class, or geographic area, but was widely diffused throughout these categories. Because of the unusual difference, a thorough review of the data processing for December and January was undertaken for both the survey data and the administrative data base to identify any error which could have caused the difference. None was found. Each program produced an accurate tabulation given the January microdata which employers provided.
Economic nature of the December to January trends. The widely disparate movements between the universe counts and the sample survey for the December-to-January period prompted reviews of trends for many additional
employment-related series to determine whether a severe worsening of the economy actually occurred over that specific period. None of these series-which included employment data from the Current Population Survey (CPS), initial claims for unemployment, new and terminated UI accounts (a rough proxy for business formations and deaths), mass layoff statistics, and unit counts of employers reporting for social security tax purposes-offered evidence of a sudden or sharp economic decline in the De-cember-January time period. No other national economic indicators provided evidence that the employment situation had worsened severely between December and January. There was no independent corroboration for the sharp drop recorded in universe job counts.

Changes in universe data reporting procedures. The January discrepancy could have possibly resulted because a majority of States implemented improved reporting procedures for the universe data beginning in January 1991. These changes centered on an initiative to disaggregate multi-establishment reports into single worksite level reports. A new reporting form and improved set of instructions were put into place to accommodate this change.
The new procedures should not have affected employment totals, per se, but these new forms and instructions were coupled with renewed efforts to clarify and improve the reporting of basic employment and wages data. These improved procedures may have brought about more accurate reporting for the first quarter of 1991. To the extent that employers changed their practices by counting employees rather than paychecks or by reporting employment for only the pay period including the 12 th of the month rather than total employment during the month, the initiative could have lowered reported employment figures in January 1991 for noneconomic reasons.

The December-to-January drop in universe employment may thus have been partially an administrative rather than an economic phenomenon. This offers a potential explanation as to why the divergence only occurred in 1 month, why the drop was not replicated in the CES surveybased estimates, and why other economic indicators did not show a corresponding sharp December-to-January decline.

Establishment survey limitations. The research into the large benchmark revision for March 1991 also included reviewing the establishment survey's known limitations in specific areas, areas which might have contributed to failure to capture a genuine economic downturn which was sudden and severe. The following survey components were examined for their potential contribution to the overall benchmark revision.

Business deaths. The establishment survey has inherent difficulty measuring employment change resulting from business deaths, especially among small firms, on a timely basis. When a sample firm goes out
of business, most often it simply does not respond to the survey that month, instead of reporting zero employment. Followup on nonrespondents may reveal an out-of-business firm, but, this information is often received too late to incorporate into monthly estimates, and the firm is treated as a nonrespondent for that month. Research to date, however, has indicated that this did not contribute substantially to the December-January discrepancy. Nearly all of the December-to-January employment decline in the universe data was in continuing units, i.e., there were not massive business deaths over that period. Therefore, no major portion of the discrepancy was attributable to sample difficulties in recording business deaths.
Business formations. The new business formation component of monthly employment is modeled through procedures that adjust for the fact that comprehensive universe information on new business startups is not available on a timely enough basis for monthly sampling or sample-based estimation procedures. The model used relied on past performance as one parameter, introducing the possibility that an abrupt change in the economy, in ways not before encountered, may cause the bias model to seriously overestimate the growth in business formation. This was examined as a possible source of some of the January 1991 discrepancy.

Monthly universe counts for the first 9 months of the postbenchmark period (April-December 1990) tracked closely with the sample-based estimates, evidence that bias levels for that period were well within the appropriate range. Bias amounts accumulate over the course of an interbenchmark year; thus, if bias adjustment were the root cause of the discrepancy, the divergence would have arisen gradually over the interbenchmark period and not suddenly in only 1 of the 12 months.

The actual bias adjustment included in the January survey estimates was approximately 60,000 , not enough to have contributed significantly to a large discrepancy. Thus, the larger-than-normal benchmark revision for 1991 does not appear to relate to any inherent problems with bias adjustment.

Survey design limitations. Another possibility is that the survey sample has some inherent bias toward larger and/ or more stable employers, a bias which might prevent its detecting a sudden, dramatic decline concentrated among smaller and more marginal firms. Design biases of this type, however, would tend to build over many months and be consistent in their effect, rather than produce an extreme effect for one month. Possible design-related problems are being investigated further through longer term research efforts which will study the effects of alternate sample design, stratification, and estimators on the establishment survey estimates.

Summary. The major potential causes for the January 1991 discrepancy between employment movements as gauged by establishment survey and universe counts, and the large benchmark revision that resulted, have been systematically explored. Precise and verifiable causes have not been fully determined. Some possible sources of problems were investigated and ruled out, and research continues in the unresolved areas.
The research efforts completed to date, however, have yielded a better understanding of the problem. The principal causes appear to reflect the factors that typically cause revisions, as well as possible design biases, and procedural changes implemented in universe reporting in January 1991.

## Effect of benchmark revisions on other series

Due to the routine benchmarking process, small revisions can occur in the series on women workers and production and nonsupervisory workers. Although there are no benchmark employment levels for these series, they are revised by computing ratios of employment for the particular series to all employees prior to revision and then applying the ratios to the revised all-employee figures. Revisions at the basic cell level are added to produce the summary level revisions.
Average weekly hours and average hourly earnings are estimated directly from reported figures at the estimating cell level and are not benchmarked. The broader industry groups of the hours and earnings series, however, require a weighting mechanism to yield meaningful averages. The production or nonsupervisory worker employment estimates for the basic cells act as weights for the hours and earnings estimates for broader industry groupings. Adjustments of the all-employee estimates to new benchmarks may alter the weights, which, in turn, may change the estimates for hours and earnings of production and nonsupervisory workers at higher levels of aggregation.

Generally, new employment benchmarks have little impact on hours and earnings estimates for major groupings. To influence the hours and earnings estimates of a broader group, employment revisions have to be relatively large and must affect industries which have substantially different hours or earnings averages than the other industries in their group. Occasionally, correcting errors in the reported payroll data for individual establishments may also change the averages of selected industries. Table 4 gives detailed information on revisions to specific hours and earnings series resulting from the March 1991 benchmark. The table indicates no substantial revisions to hours and earnings series, despite the large revisions to the all-employee data.

## Methodology

Benchmark adjustment procedure. Establishment survey benchmarking is done on an annual basis to a population derived primarily from the administrative file of employees covered by UI. The time required to complete the
revision process-from the full collection of the UI population data to publication of the revised industry estima-tes-is usually about 15 months. The benchmark adjustment procedure traditionally replaces the sample-based employment totals for March of each year with the UIbased population counts for March. The universe-based benchmark count thus determines the final employment level, and sample movements determine month-to-month trends.
Benchmarks are established for each of 1,700 industry-size-class basic estimation cells and are aggregated to develop published levels. The monthly sample-based estimates for the year preceding and the year following the benchmark are also then subject to revision.

Estimates for the months preceding the March benchmark are adjusted using a "wedge-back" procedure. The difference between the benchmark level and the previously published March sample estimate is calculated and spread across the 11 months subsequent to the previous benchmark. The wedge is linear. Eleven-twelfths of the March difference is added to February estimates, ten-twelfths to the January estimates, and so forth, back to the previous April estimates which receive one-twelfth of the March difference. The difference is not wedged back beyond April because the previous March value is the benchmark count for the previous year. The standard wedge methodology assumes that the total estimation error since the last benchmark accumulated at a steady rate throughout the current benchmark year.

Estimates for the months following the March benchmark are recalculated by applying previously derived over-the-month sample changes to the revised March level. New bias adjustment factors, which incorporate the most recent benchmark experience, are also calculated and applied during postbenchmark estimation. Although the employment levels for postbenchmark months can be substantially revised, the trends and over-the-month changes tend to remain the same.
Benchmark source material. The principal source of benchmark data for private industries is the "ES-202 report," which contains employment data reported to State employment security agencies by employers covered under State UI laws. UI coverage is now extended to approximately 98 percent of employees in the total nonfarm sector and 99 percent of those in the private nonfarm sector. Employment counts for the executive, legislative, and judicial branches of the Federal Government are derived from official summaries prepared by the U.S. Office of Personnel Management (OPM). These summaries are complete counts of Federal workers and are not usually subject to revision. ${ }^{1}$ The official OPM summaries do not provide

[^3]detail on Federal employment by industries, such as hospitals, on a current monthly basis. BLS estimates these from a sample of Federal establishments.

BLS uses several sources to obtain employment counts for the remaining industries partially covered or exempt from mandatory UI coverage. Data on employees covered under Social Security laws, published by the Bureau of the Census in County Business Patterns, are used to augment UI data for nonoffice insurance sales workers and to derive benchmark figures for religious organizations, private schools, and hospitals. Benchmarks for State and local government hospitals and educational institutions are based on the Annual Survey of Governments conducted by the Bureau of the Census. Data for interstate railroads are obtained from the Interstate Commerce Commission.

Bias adjustment. Bias adjustment factors are computed for each 3-digit SIC level but are applied at the basic cell level, as part of standard monthly estimation procedures. The main purpose of bias adjustment is to reduce a primary source of nonsampling error in the survey: the inability to capture, on a timely basis, employment generated by new business formations. There is a lag of several months between an establishment opening for business and its appearing on the UI universe frame, available for sampling. Because new firms generate a substantial amount of employment growth during any given year, nonsampling methods must be used to capture this growth; otherwise, substantial underestimation of total employment levels would occur. Formal bias adjustment procedures have been used in the CES program since the late 1960's. Prior to the 1983 benchmark, bias adjustments were derived from a simple mean error model, which averaged undercount errors for the previous 3 years to arrive at bias projections for the coming postbenchmark year.

This procedure eventually proved inadequate during periods of rapidly changing employment trends, and bias adjustment methodology was revised. Research done in the early 1980's indicated that bias requirements correlated strongly with current employment growth or decline. Based on this finding, a revised method was developed. It incorporated data on employment growth over the most recent two quarters, and a regression-derived coefficient for the significance of that change, to adjust the mean error model results. This methodological improvement made the bias model more sensitive to cyclical changes. BLS has used the regression-adjusted mean error model since 1983 for the production of national estimates.

It should be noted that although the primary function of bias adjustment is to account for employment resulting from new business formations, it also adjusts for other elements of nonsampling error in the survey, because the primary input to the modeling procedure is total estimation error. Chief among these other sources of nonsampling error is the "business death bias" referenced earlier, which
results from a difficulty in collecting reports from firms as they go out of business. Bias factors then primarily adjust for the net business formation/business termination element of the population.

Text table B summarizes the above discussion; it shows the March benchmarks and revisions for total private employment for each year from 1981 through 1991. The table also displays the average monthly "bias added" and "bias required" columns. Bias added shows the average amount of bias which was added each month over the course of an interbenchmark period. For example, the bias added for 1984 is listed as 140,000 ; this represents the average of bias adjustments made each month over the period April 1983 through March 1984. Bias required is computed retrospectively, after the March benchmark for a given year is known. Bias required figures are calculated by taking the difference between a March estimate derived purely from the sample (i.e. a series calculated without bias adjustment) and the March benchmark. Dividing this figure by 12 gives the average monthly bias required figure. The bias required thus equals the amount of bias adjustment which would have achieved a zero benchmark error. The difference between the total bias required and total bias added is then, by definition, approximately the benchmark revi-

Text table B. March employment benchmarks and blas adjustments for total private Industries, March 1981-91

| Year | Benchmark |  | Average monthly bias |  | Over-theyear employment changes ${ }^{5}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Employment ${ }^{1}$ | Revision ${ }^{2}$ | Added ${ }^{3}$ | Required ${ }^{4}$ |  |
| 1981 | 73,903 | -324 | 116 | 90 | 183 |
| 1982 | 73,370 | -133 | 104 | 93 | -533 |
| 1983 | 72,043 | -78 | 102 | 96 | -1,327 |
| 1984 | 76,371 | 341 | 140 | 169 | 4,328 |
| 1985 | 79,446 | -131 | 152 | 141 | 3,075 |
| 1986 | 81,204 | -400 | 149 | 116 | 1,758 |
| 1987 | 83,173 | 21 | 98 | 99 | 1,969 |
| 1988 | 86,180 | -310 | 114 | 88 | 3,007 |
| 1989 | 89,015 | -93 | 131 | 123 | 2,835 |
| 1990 | 90,546 | -261 | 85 | 63 | 1,531 |
| 1991. | 88,790 | -583 | 61 | 12 | -1,756 |

[^4]sion amount, for a given year. Also provided in the table, for comparison, is the March-to-March change. As discussed above, the over-the-year changes indicate correlation with the bias added and bias required figures.

Noneconomic code changes. A major source of benchmark revision at the major industry division level and below is noneconomic code changes, which are introduced into the universe data in the first quarter of each calendar year.

Each year, approximately one-third of all establishments are validated and corrected by the Standard Industrial Classification (SIC) refiling survey. Corrections are made to individual establishments' SIC and ownership codes through this process. The volume of these corrections is normally quite large and can thus be expected to have a substantial impact on universe employment counts at the industry levels, without affecting the total nonfarm employment level.

Under the refiling cycle each division is subject to refiling every third year. When a division is refiled, a substantial amount of employment may be reclassified out of it and into other major divisions, thus lowering the benchmark level for that division and potentially causing a significant downward revision in the employment totals previously published. Correspondingly, the reclassification raises benchmark levels in other industries which receive the reclassified establishments. Large noneconomic code changes can affect the measurement of benchmark error at the industry levels but do not affect revisions at the total nonfarm level.

Effects for the 1991 benchmark. Refiling of the services division, effective with the January 1991 universe data, had a major impact on the distribution of benchmark revisions for the March 1991 benchmark. Nearly three-quarters of the downward revision in services was attributable to noneconomic code changes resulting from SIC refiling. The net effect of the SIC refiling in services was to reclassify employment of over 300,000 from services to other major divisions. Text table C shows the net effect on all major divisions of this year's refiling and displays the actual benchmark revision alongside an "adjusted benchmark revision," i.e., the amount of revision excluding the noneconomic code change component. This table shows that overestimation was actually spread across all major divisions for 1991 and not primarily concentrated in services, a fact which the large noneconomic code change adjustments had masked.

## Seasonal adjustment procedure

BLS uses the X-11 ARIMA (Auto-Regressive Integrated Moving Average) seasonal adjustment procedure, developed by Statistics Canada ${ }^{2}$, to seasonally adjust

[^5]establishment-based employment, hours, and earnings data. ARIMA projects the unadjusted data forward for 1 year, prior to seasonally adjusting the series. The use of ARIMA projections lessens the need for revisions of historical data in future seasonal adjustments. ARIMA projections are not used in series in which the projections do not meet test requirements ${ }^{3}$.

The Bureau computes and publishes projected seasonal adjustment factors twice a year for use in seasonally adjusting establishment-based employment, hours, and earnings data. Factors for the 6-month period, May through October 1992, are published in this issue. Additionally, all published seasonally adjusted series have been revised for the most recent 5 years (1987-92) to incorporate new seasonal factors.

A moving-holiday extension of X-11 ARIMA is used to seasonally adjust the average weekly hours series and manufacturing overtime hours series to account for the effects of the presence or absence of religious holidays in the April survey reference period and of Labor Day in the September reference period ${ }^{4}$. Historical seasonally adjusted series from January 1980 forward incorporate this adjustment.

All series are seasonally adjusted using the multiplicative models under X-11 ARIMA. For employment, seasonal adjustment factors are directly applied to the component levels. Seasonally adjusted totals for the hours and earnings series are obtained by taking a weighted average of the seasonally adjusted data for the component series. Tables 6 through 11 show the seasonal adjustment factors that will be used for the period May through October 1992 for all published series. Seasonally adjusted data are not published for a small number of series characterized by small seasonal components relative to their trend-cycle and/or irregular components. These series are identified in tables 7 and 9. These unpublished series are used, however, in aggregations to broaden seasonally adjusted levels.

## Publication of revised data

Data for detailed industry categories of employment, hours, and earnings will appear in a forthcoming supplement to Employment, Hours, and Earnings, United States, 1909-90, (BLS Bulletin 2370), issued in March 1991. The supplement will contain all of the historical data revised as a result of this benchmark and updated seasonal adjustment factors, that is, unadjusted data for April 1990 through February 1992 and seasonally adjusted data for January 1987 through February 1992.

Employment, hours, and earnings data for the 19 new services sector industries (text table A) will be published from the date of inception of each series.

[^6]Employment estimates for nonfarm industries are published monthly in Employment and Earnings. Those industries for which monthly data are not published are ei-
ther quite small or are not represented by a sufficient sample. Table 5 contains the March 1991 benchmark figures for these industries.

Text table C. Effect of noneconomic code changes on benchmark employment levels, March 1991

| Industry | Overall benchmark revision changes | Net employment shift, due to code changes ${ }^{1}$ | Benchmark revision less effect of code changes | Percent benchmark revision |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

' Seasonally adjusted data are derived by aggregation of the component series.
${ }^{2}$ No ARIMA models were identified to extend the unadjusted series for one year. Factors shown are projected using $\times-11$ without the ARIMA option.
${ }^{3}$ Seasonal adjustment factors are not computed because the seasonal component is small relative to the trend-cycle and/or irregular components and consequently cannot be separated with sufficient precision.

- Data relate to production workers in mining and manufacturing; construction workers in construction; and nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services.
${ }^{2}$ Seasonally adjusted data are derived by aggregation of the component series.

Seasonal adjustment factors are not computed because the seasonal component is small relative to the trend-cycle and/or irregular components and
consequently cannot be separated with sufficient precision.

No ARIMA models were identified to extend the unadjusted series for one year. Factors shown are projected using X-11 without the ARIMA option.
${ }^{5}$ No moving-holiday adjustment was done for September because there was no evidence of significant effects associated with the relative timing of Labor Day and the reference period of the payroll survey.

Table 10. Seasonal adjustment factors for average weekly overtime hours of production workers on manufacturing payrolls

| Industry group | 1992 |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | May | June | July | Aug. | Sept. | Oct. |
| Manufacturing ${ }^{1}$ |  |  |  |  |  |  |
| Durable goods Nondurable goods ${ }^{2}$ | $\begin{aligned} & 94.9 \\ & 93.0 \end{aligned}$ | $\begin{aligned} & 102.2 \\ & 100.2 \end{aligned}$ | $\begin{array}{r} 97.1 \\ 100.2 \end{array}$ | $\begin{aligned} & 104.3 \\ & 108.5 \end{aligned}$ | 109.4 114.1 | 106.0 106.4 |

Seasonally adjusted data are derived by
aggregation of the component series.
No moving-holiday adjustment was done for
September because there was no evidence of
significant effects associated with the relative timing of Labor Day and the reference period of the payroll survey.

1 Employed persons with a job but not at work and persons at work part time are distributed according to whether they usually work full or part time.
${ }^{2}$ Data not shown where base is less than 75,000 .
NOTE: in the summer months, the educational attainment levels of youth not enrolied in school are increased by the temporary movement of high school and college students into that group. Educational attainment levels, beginning January

1992, have been revised to reflect degrees or diplomas received rather than yeers of school completed. The sum of these categonies may not equal totals because of the estimation procedures used. Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

HOUSEHOLD DATA
NOT SEASONALLY ADJUSTED

## A-8. Employment status of male Vietnam-era veterans and nonveterans by age

(Numbers in thousands)

NOTE: Male Vietnam-era veterans are men who served in the Armed Forces between August 5, 1964 and May 7, 1975. Nonveterans are men who have never served in the Armed Forces; published data
are limited to those 35 to 49 years of age, the group that most closely corresponds to the bulk of the Vietnam-era veteran population.

## A-9. Employed and unemployed full- and part-time workers by sex, age, and race

(In thousands)

${ }^{1}$ Excludes persons living alone or with nonrelatives, persons in families where the husband, wife, or other person maintaining the family is in the Armed Forces, and persons in unrelated subfamilies.

NOTE: Estimates shown in this table for husbands, wives, and women
who maintain families are somewhat different from marital status estimates shown in other tables in this publication because of differences in definitions and weighting patterns used in aggregating the data.

A-11. Unemployed persons by marital status, race, age, and sex

${ }^{1}$ Includes members of the Armed Forces stationed in the United States.
${ }^{2}$ Labor force as a percent of the noninstitutional population.
${ }^{3}$ Total employment as a percent of the noninstitutional population.

- Unemployment as a percent of the labor force (including the resident

Armed Forces).
NOTE: The population and Armed Forces figures are not adjusted for seasonal vanation. Detail for the seasonally adjusted data shown in tables A-32 through A-41 will not necessarily add to totals because of the independent seasonal adjustment of the various series.

A-33. Employment status of the civilian noninstitutional population by sex and age, seasonally adjusted
(Numbers in thousands)

' Excludes persons "with a job but not at work" during the survey period for such reasons as vacation, illness, or industrial dispute.
NOTE: Data on occupations and industries for 1992 are not fully
comparable with data for prior years because of the introduction of the classification systems used in the 1990 census.

## A-36. Employed civilians by sex and age, seasonally adjusted

| 1 Not available. <br> ${ }^{2}$ Data include Alaska and Hawaii beginning in 1959. This inclusion resulted in an increase of $\mathbf{2 1 2 , 0 0 0}$ ( 0.4 percent) in the nonfarm total for the March 1959 benchmark month. <br> $\mathrm{p}=$ praliminary. |  |  |  |  |  |  | NOTE: Effective with the release of May 1992 data, BLS has revised establishment survey data to reflect new benchmarks and updated seasonal adjustment factors. Because of these revisions, unadjusted data (beginning April 1990) and seasonally adjusted data (beginning January 1987) differ from those previously published. See the article in this issue for additional information. |  |  |  |  |  |  |  |  |

${ }^{1}$ Data relate to production workers in mining and manufacturing; construction workers in construction; and nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services.

Data relate to line-haul railroads with operating revenues of $\$ 50,000,000$ or more.
${ }^{3}$ Excludes nonoffice commissioned real estate sales agents.
${ }^{4}$ Prepared by the Office of Personnel Management. Data relate to
civilian employment only and exclude the Central intelligence Agency and the National Security Agency.
${ }^{5}$ Includes rural mail carriers.

- Data not available.
${ }^{p}=$ preliminary.
NOTE: Data in this table have been revised to reflect March 1991 benchmarks and differ from data previously published. See the article in this issue for additional information.

# A Note on Average Hourly Earnings <br> in Aircraft (SIC 3721) and Guided Missiles and Space Vehicles (SIC 3761) Manufacturing 

For many years, the Bureau of Labor Statistics average hourly earning series for production workers in aircraft manufacturing (SIC 3721) and guided missiles and space vehicles manufacturing (SIC 3761) have been used to escalate labor costs in contracts between aerospace companies and their customers. Although the Bureau's series by definition take account of traditional wage rate changes, they do not capture "lump-sum payments to workers in lieu of general wage increases" which were negotiated in aerospace manufacturers' collective bargaining agreements beginning in late 1983.
Because of special circumstances in the aerospace
industry, bLS has calculated average hourly earnings series for SIC 3721 and SIC 3761 which include lump-sum payments. These series, beginning in October 1983, the effective date of the first aerospace bargaining agreement using lump-sum payments, were published in the June 1988 issue of Employment and Earnings. Current and year earlier data are presented in table C-2a along with the average hourly earnings series produced as part of the Current Employment Statistics program. An explanation of the methodology used to derive these series appears in the Explanatory Notes of this publication.

C-2a. Average hourly earnings in aircraft (SIC 3721) and guided missiles and space vehicles (SIC 3761) manufacturing

| Series | Aircraft (SIC 3721) |  |  |  | Guided missiles and space vehicles (SIC 3761) |  |  |  |

${ }^{1}$ Data are obtained directly from the Current Poputation Survey. See the Explanatory Notes for Region, State, and Area Labor Force Data.
$p=$ preliminary.
NOTE: Data reter to place of residence. Estimates for 1991 have been
benchmarked to 1991 Current Population Survey annual averages. Estimates for 1992 are provisional and will be revised when new benchmark and population information becomes available. Area definitions are published annually in the May issue of this publication.

## Explanatory Notes

## Introduction

The statistics in this periodical are compiled from two major sources: (1) Household interviews, and (2) reports from employers.
Data based on household interviews are obtained from a sample survey of the population 16 years of age and over. The survey is conducted each month by the Bureau of the Census for the Bureau of Labor Statistics and provides comprehensive data on the labor force, the employed, and the unemployed, including such characteristics as age, sex, race, family relationship, marital status, occupation, and industry attachment. The survey also provides data on the characteristics and past work experience of those not in the labor force. The information is collected by trained interviewers from a sample of about 60,000 households, representing 729 areas in 1,973 counties and independent cities, with coverage in 50 States and the District of Columbia. The data collected are based on the activity or status reported for the calendar week including the 12th of the month.
Data based on establishment records are compiled each month from mail questionnaires by the Bureau of Labor Statistics, in cooperation with State agencies. The establishment survey is designed to provide industry information on nonfarm wage and salary employment, average weekly hours, average hourly earnings, and average weekly earnings for the Nation, States, and metropolitan areas. The employment, hours, and earnings series are currently based on payroll reports from a sample of over 350,000 establishments employing over 41 million nonfarm wage and salary workers. The data relate to all workers, full or part time, who receive pay during the payroll period which includes the 12th day of the month.

## RELATION BETWEEN THE HOUSEHOLD AND ESTABLISHMENT SERIES

The household and establishment data supplement one another, each providing significant types of information that the other cannot suitably supply. Population characteristics, for example, are readily obtained only from the household survey whereas detailed industrial classifications can be reliably derived only from establishment reports.
Data from these two sources differ from each other because of differences in definitions and coverage, sources of information, methods of collection, and estimating procedures. Sampling variability and response errors are additional reasons for discrepancies. The major factors which
have a differential effect on the levels and trends of the two series are as follows.

## Employment

Coverage. The household survey definition of employment comprises wage and salary workers (including domestics and other private household workers), self-employed persons, unpaid workers who worked 15 hours or more during the survey week in family-operated enterprises, and members of the Armed Forces stationed in the United States. Civilian employment in both agricultural and nonagricultural industries is included. The payroll survey covers only wage and salary employees on the payrolls of nonfarm establishments.

Multiple jobholding. The household survey provides information on the work status of the population without duplication, since each person is classified as employed, unemployed, or not in the labor force. Employed persons holding more than one job are counted only once and are classified according to the job at which they worked the greatest number of hours during the survey week. In the figures based on establishment reports, persons who worked in more than one establishment during the reporting period are counted each time their names appear on payrolls.

Unpaid absences from jobs. The household survey includes among the employed all civilians who had jobs but were not at work during the survey week-that is, were not working but had jobs from which they were temporarily absent because of illness, bad weather, vacation, labor-management disputes, or because they were taking time off for various other reasons, even if they were not paid by their employers for the time off. In the figures based on payroll reports, persons on leave paid for by the company are included, but not those on leave without pay for the entire payroll period.
For a comprehensive discussion of the differences between household and establishment survey employment data, see Gloria P. Green's article, "Comparing Employment Estimates From Household and Payroll Surveys," Monthly Labor Review, December 1969.

## Hours of work

The household survey measures hours actually worked whereas the payroll survey measures hours paid for by
employers. In the household survey data, all persons with a job but not at work are excluded from the hours distributions and the computations of average hours. In the payroll survey, production or nonsupervisory employees on paid vacation, paid holiday, or paid sick leave are included and assigned the number of hours for which they were paid during the reporting period.

## Earnings

The household survey measures median earnings of wage and salary workers in all occupations and industries in both the private and public sectors. Data refer to the usual earnings received from the worker's sole or primary job. Data from the establishment survey generally refer to average earnings of production and related workers in mining and manufacturing, construction workers in construction, and nonsupervisory employees in private service-producing industries. For a comprehensive discussion of the household survey earnings series, see Technical Description of the Quarterly Data on Weekly Earnings from the Current Population Survey, bLs Bulletin 2113.

## COMPARABILITY OF THE HOUSEHOLD DATA WITH OTHER SERIES

Unemployment insurance data. The unemployed total from the household survey includes all persons who did not have a job at all during the survey week and were looking for work or were waiting to be called back to a job from which they had been laid off, whether or not they were eligible for unemployment insurance. Figures on unemployment insurance claims, prepared by the Employment and Training Administration of the Department of Labor, exclude persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (some workers in agriculture, domestic services, and religious organizations, and self-employed and unpaid family workers). Beginning in January 1978, coverage was extended to include domestic workers whose employers paid $\$ 1,000$ or more in wages in any calendar quarter, agricultural employees whose employers engaged 10 or more workers in 20 weeks or paid a total of $\$ 20,000$ or more in wages in any calendar quarter, and almost all State and local government employees.
In addition, the qualifications for drawing unemployment compensation differ from the definition of unemployment used in the household survey. For example, persons with a job but not at work and persons working only a few hours during the week are sometimes eligible for unemployment
compensation but are classified as employed rather than unemployed in the household survey.

For an examination of the similarities and differences between State insured unemployment and total unemployment, see "Measuring Total and State Insured Unemployment" by Gloria P. Green in the June 1971 issue of the Monthly Labor Review.

Agricultural employment estimates of the Department of Agriculture. The principal differences in coverage are the inclusion of persons under 16 in the Economics and Statistics Service series and the treatment of dual jobholders, who are counted more than once if they work on more than one farm during the reporting period. There are also wide differences in sampling techniques and collecting and estimating methods, which cannot be readily measured in terms of their impact on differences in the levels and trends of the two series.

## COMPARABILITY OF THE PAYROLL EMPLOYMENT DATA WITH OTHER SERIES

Statistics on manufactures and business, Bureau of the Census. BLs establishment statistics on employment differ from employment counts derived by the Bureau of the Census from its censuses or sample surveys of manufacturing and business establishments. The major reasons for noncomparability are different treatment of business units considered parts of an establishment, such as central administrative offices and auxiliary units, the industrial classification of establishments, and different reporting patterns by multiunit companies. There are also differences in the scope of the industries covered, e.g., the Census of Business excludes professional services, public utilities, and financial establishments, whereas these are included in the BLS statistics.

County Business Patterns. Data in County Business Patterns (CBP), published by the Bureau of the Census, U.S. Department of Commerce, differ from bLS establishment statistics in the treatment of central administrative offices and auxiliary units. Differences may also arise because of industrial classification and reporting practices. In addition, CBP excludes interstate railroads and government, and coverage is incomplete for some of the nonprofit activities.

Employment covered by State unemployment insurance programs. Most nonfarm wage and salary workers are covered by the unemployment insurance programs. However, certain activities, such as interstate railroads, parochial schools, and churches are not covered by unemployment insurance whereas these are included in the BLS establishment statistics.

## Household Data (A tables)

## COLLECTION AND COVERAGE

Statistics on the employment status of the population, the personal, occupational, and other characteristics of the employed, the unemployed, and persons not in the labor force, and related data are compiled for the BLS by the Bureau of the Census in its Current Population Survey (CPS). A detailed description of this survey appears in Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey, BlS Report 463. Historical national data are published in Labor Force Statistics Derived From the Current Population Survey, BLS Bulletin 2307.

These monthly surveys of the population are conducted through a scientifically selected sample designed to represent the civilian noninstitutional population. Respondents are interviewed to obtain information about the employment status of each member of the household 16 years of age and over. The inquiry relates to activity or status during the calendar week, Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted in the following week.
Inmates of institutions and persons under 16 years of age are not covered in the regular monthly enumerations, and are excluded from the population and labor force statistics shown in this publication. Data on the members of the Armed Forces stationed in the United States, who are included as part of the categories 'noninstitutional population," "labor force," and 'total employment,' are obtained from the Department of Defense.

Each month about 60,000 occupied units are eligible for interview. About 2,600 of these households are visited but interviews are not obtained because the occupants are not at home after repeated calls or are unavailable for other reasons. This represents a noninterview rate for the survey of between 4 and 5 percent. In addition to the $60,000 \mathrm{oc}$ cupied units, there are 11,500 sample units in an average month which are visited but found to be vacant or otherwise not enumerated. Part of the sample is changed each month. The rotation plan provides for three-fourths of the sample to be common from one month to the next, and one-half to be common with the same month a year earlier.

## CONCEPTS AND DEFINITIONS

The concepts and definitions underlying labor force data have been modified, but not substantially altered, since the inception of the survey in 1940; those used since 1967 are as follows:
Employed persons are (a) all civilians who, during the survey week, did any work at all as paid employees, in their own business, profession, or on their own farm, or who worked 15 hours or more as unpaid workers in an enterprise
operated by a member of the family; and (b) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, labor-management disputes, or personal reasons, whether they were paid for the time off or were seeking other jobs. Members of the Armed Forces stationed in the United States are also included in the employed total.

Each employed person is counted only once. Those who held more than one job are counted in the job at which they worked the greatest number of hours during the survey week.

Included in the total are employed citizens of foreign countries who are temporarily in the United States but not living on the premises of an embassy. Excluded are persons whose only activity consisted of work around the house (painting, repairing, or own home housework) or volunteer work for religious, charitable, and similar organizations.

Unemployed persons are all civilians who had no employment during the survey week, were available for work, except for temporary illness, and had made specific efforts to find employment some time during the prior 4 weeks. Persons who were waiting to be recalled to a job from which they had been laid off or were waiting to report to a new job within 30 days need not be looking for work to be classified as unemployed.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of seeking work. Measurements of mean and median duration are computed from a distribution of single weeks of unemployment.

Unemployment is also categorized according to the status of individuals at the time they began to look for work. The reasons for unemployment are divided into four major groups. (1) Job losers are persons whose employment ended involuntarily who immediately began looking for work, and persons on layoff. (2) Job leavers are persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work. (3) Reentrants are persons who previously worked at a full-time job lasting 2 weeks or longer but were out of the labor force prior to beginning to look for work. (4) New entrants are persons who never worked at a full-time job lasting 2 weeks or longer. Each of these four categories of the unemployed may be expressed as an unemployment rate or proportion of the entire civilian labor force; the sum of the four rates thus equals the unemployment rate for all civilian workers.

Jobseekers are all unemployed persons who made specific
efforts to find a job sometime during the 4 -week period preceding the survey week. Jobseekers do not include those persons unemployed because they (a) were waiting to be called back to a job from which they had been laid off or (b) were waiting to report to a new job within 30 days. Jobseekers are grouped by the methods used to seek work, including going to a public or private employment agency or to an employer directly, seeking assistance from friends or relatives, placing or answering ads, or utilizing some other method. Examples of the "other" category include being on a union or professional register, obtaining assistance from a community organization, or waiting at a designated labor pickup point.

The civilian labor force comprises all civilians classified as employed or unemployed in accordance with the criteria described above. The labor force also includes members of the Armed Forces stationed in the United States.
The overall unemployment rate represents the number unemployed as a percent of the labor force, including members of the Armed Forces stationed in the United States.
The unemployment rate for all civilian workers represents the number unemployed as a percent of the civilian labor force. This measure can also be computed for groups within the labor force classified by sex, age, race, Hispanic origin, marital status, etc.
Participation rates represent the proportion of the population that is in the labor force. The labor force participation rate is the ratio of the labor force, including the resident Armed Forces, to the noninstitutional population. The civilian labor force participation rate is the ratio of the civilian labor force to the civilian noninstitutional population. Civilian labor force participation rates are usually published for sex-age groups, often cross-classified by other demographic characteristics such as race and educational attainment.
Employment-population ratios represent the proportion of the noninstitutional population that is employed. The total employment-population ratio is total employment, including the resident Armed Forces, as a percent of the noninstitutional population. The civilian employment-population ratio is the percentage of all employed civilians in the civilian noninstitutional population.
Not in the labor force includes all persons who are not classified as employed or unemployed. These persons are further classified as engaged in own home housework, in school, unable to work because of long-term physical or mental illness, retired, and other. The "other" group includes individuals reported as too old or temporarily unable to work, the voluntarily idle, seasonal workers for whom the survey week fell in an off season and who were not reported as looking for work, and persons who did not look for work because they believed that no jobs were available in the area or that no jobs were available for which they could qualifydiscouraged workers. Persons doing only incidental, unpaid family work (less than 15 hours in the specified week) are also classified as not in labor force.
For persons not in the labor force, data on previous work experience, intentions to seek work, desire for a job at the
time of interview, and reasons for not looking for work are published on a quarterly basis. As of Januafy 1970, the detailed questions for persons not in the labor force are asked only in those households that are in the fourth and eighth months of the sample, i.e., the "outgoing" groups, those which had been in the sample for 3 previous months and would not be in for the subsequent month. Between 1967 and 1969, these questions were asked in those households entering the sample for the first time and those returning for the second 4 months of interviewing, i.e., the "incoming" groups.

Occupation, industry, and class of worker for the employed apply to the job held in the survey week. Persons with two or more jobs are classified in the job at which they worked the greatest number of hours during the survey week. The unemployed are classified according to their last full-time job lasting 2 weeks or more. The classifications of occupations and industries used in data derived from the CPS are defined as in the 1990 census. Information on the detailed categories included in these groups is available upon request.
The class-of-worker breakdown specifies wage and salary workers subdivided into private and government workers; self-employed workers; and unpaid family workers. Wage and salary workers receive wages, salary, commission, tips, or pay in kind from a private employer or from a government unit. Self-employed persons are those who work for profit or fees in their own business, profession, or trade, or operate a farm. Unpaid family workers are persons working without pay for 15 hours a week or more on a farm or in a business operated by a member of the household to whom they are related by birth or marriage.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, persons who normally work 40 hours a week but were off on the Columbus Day holiday would be reported as working 32 hours even though they were paid for the holiday. For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the week; all the hours are credited to the major job.

Persons who worked 35 hours or more during the survey week are designated as working full time. Persons who worked between 1 and 34 hours are designated as working part time. Part-time workers are classified by their usual status at their present job (either full or part time) and by their reason for working part time during the survey week (economic or noneconomic reasons). Economic reasons include: Slack work, material shortages, repairs to plant or equipment, start or termination of a job during the week, and inability to find full-time work. Noneconomic reasons include: Labor dispute, bad weather, own illness, vacation, demands of home or school, no desire for full-time work, and full-time worker only during peak season. Persons on full-time schedules include, in addition to those working 35 hours or more, those who worked from 1 to 34 hours for noneconomic reasons and usually work full time.

Data on employment "at work" differ from data on total employment because they exclude persons in the zero-hours-
worked category, "with a job but not at work." These are persons who were absent from their jobs for the entire week for such reasons as bad weather, vacation, illness, or involvement in a labor dispute.
Employed persons are also categorized into full- and parttime groupings based primarily on their usual status. In this context, full-time workers are those who (a) worked 35 hours or more during the survey week, (b) worked 1 to 34 hours for economic or noneconomic reasons, but usually work full time, and (c) were with a job but not at work and usually work full time. Similarly, part-time workers are those who (a) voluntarily worked 1 to 34 hours during the survey week, (b) worked 1 to 34 hours for economic reasons, but usually work part time, i.e., persons who could only find part-time work, and (c) were with a job but not at work and usually work part time.

Unemployment rates for full- and part-time workers are calculated using the concepts of the full- and part-time labor force which are based on the type of job-full or part timethat persons-whether working or unemployed-report that they want. The "full-time labor force"' includes all persons working part time but who desire full-time work, that is, working part time for economic reasons. Thus, this category consists of persons on full-time schedules; all persons involuntarily working part time regardless of their usual status; and unemployed persons seeking full-time jobs. The 'parttime labor force", consists of persons working part time voluntarily and unemployed persons seeking part-time work. Employed persons with a job but not at work are distributed according to whether they usually work on full-time or voluntary part-time schedules.
Labor force time lost is a measure of aggregate hours lost to the economy through unemployment and involuntary parttime employment and is expressed as a percent of potentially available aggregate hours. It is computed by assuming that: (1) unemployed persons looking for full-time work lost an average of 37.5 hours, (2) those looking for part-time work lost the average number of hours actually worked by voluntary part-time workers during the survey week, and (3) persons on part time for economic reasons lost the difference between 37.5 hours and the actual number of hours they worked.

White, black, and other are terms used to describe the race of workers. Included in the "other'" group are American Indians, Alaskan Natives, and Asians and Pacific Islanders. All tables in this publication which contain racial data, with the exception of A-5 and its annual counterpart, present data for the black population group. Because of their relatively small sample size, data for 'other'' races are not published. In the enumeration process, race is determined by the household respondent.
Hispanic origin refers to persons who identified themselves in the enumeration process as Mexican, Puerto Rican living on the mainland, Cuban, Central or South American, or of other Hispanic origin or descent. Persons of Hispanic origin
may be of any race; thus they are included in both the white and black population groups.

Vietnam-era veterans are those who served in the Armed Forces of the United States between August 5, 1964, and May 7, 1975. Data are limited to men in the civilian noninstitutional population; i.e., veterans in institutions and women are excluded. Nonveterans are men who never served in the Armed Forces.

Usual weekly earnings data are provided from responses to the question "How much does...USUALLY earn per week at this job before deductions?'' Included are any overtime pay, commissions, or tips usually received. The term "usual" is as perceived by the respondent. If the respondent asks for a definition of usual, interviewers are instructed to define the term as more than half the weeks worked during the past 4 or 5 months. Data refer to wage and salary workers (excluding the incorporated self-employed) who usually work full time on their sole or primary job.

Median earnings indicate the value which divides the earnings distribution into two equal parts, one part having values above the median and the other having values below the median. The medians as shown in this publication are calculated by linear interpolation of the $\$ 50$ centered interval within which each median falls.

Data expressed in constant dollars are deflated by the Consumer Price Index for All Urban Consumers (CPI-U).

Single, never married; married, spouse present; and other marital status are terms used to define the marital status of individuals at the time of interview. Married, spouse present, applies to husband and wife if both were reported as members of the same household even though one may be temporarily absent on business, vacation, on a visit, in a hospital, etc. Other marital status applies to persons who are married, spouse absent; widowed; or divorced. Married, spouse absent, includes persons who are separated because of marital discord, as well as persons who are living apart because either the husband or the wife was employed and living away from home, serving in the Armed Forces, or had a different place of residence for any reason.

A household consists of all persons-related family members and all unrelated persons-who occupy a housing unit. A house, an apartment, a group of rooms, or a single room is regarded as a housing unit when occupied or intended for occupancy as separate living quarters.

A householder is the person (or one of the persons) in whose name the housing unit is owned or rented. The term is never applied to either husbands or wives in married-couple families but relates only to persons in families maintained by either men or women without a spouse.

Family refers to a group of two or more persons residing together who are related by birth, marriage, or adoption; all such persons are considered as members of one family even though they may include a related subfamily, that is, a married couple or a parent-child group related by birth or marriage to the householder and sharing the living quarters. The
count of families used in this publication excludes unrelated subfamilies such as lodgers, guests, or resident employees living in a household but not related to the householder. Families are classified either as married-couple families or as families maintained by women or men without spouses. A family maintained by a woman or a man is one in which the householder is either single, widowed, divorced, or married, spouse absent. Data on the earnings of families exclude all those in which there is no wage or salary earner or in which the husband, wife, or other persons maintaining the family is either self-employed or in the Armed Forces.
Poverty areas are defined as those census tracts in tracted areas, and Minor Civil Division's (MCD's) in untracted areas, in which 20 percent or more of the noninstitutional residents were poor according to the 1980 decennial census. Persons were classified as poor or nonpoor by comparing money income to a series of poverty income thresholds which vary by family size and number of children. While poverty areas have a substantial concentration of low-income residents, many poor persons live outside these areas, and conversely, the areas include many people who are not poor.

The metropolitan areas classification consists of the total of all Metropolitan Statistical Areas (MSA's) as defined by the Office of Management and Budget (OMB) as of June 30, 1983. These definitions differ from those used in the 1980 decennial census. A detailed discussion of the MSA definitions as well as changes in terminology can be found in "The New Metropolitan Area Definitions" section of the 1980 Census of Population Supplementary Report on Metropolitan Statistical Areas, PC-S1-18. Nonmetropolitan areas consist of the total territory outside MSA's.
The urban population, as defined for the 1980 census, comprises all persons living in urbanized areas and in places of 2,500 or more inhabitants outside urbanized areas. More specifically, the urban population consists of all persons living in (1) places of 2,500 or more inhabitants incorporated as cities, villages, boroughs (except in Alaska and New York), and towns (except in the New England States, New York, and Wisconsin), but excluding those persons living in the rural portions of extended cities; (2) other territories, incorporated and unincorporated, included in urbanized areas. The population not classified as urban constitutes the rural population.

## HISTORICAL COMPARABILITY

## Change in lower age limit

The lower age limit for official statistics on the labor force, employment, and unemployment was raised from 14 to 16 years of age in January 1967. Insofar as possible, historical series have been revised to provide consistent information based on the population 16 years and over. For a detailed discussion of this and other definitional changes introduced at that time, including estimates of their effect on the various series, see "New Definitions for Employment and

Unemployment,'’ Employment and Earnings and Monthly Report on the Labor Force, February 1967.

## Noncomparability of labor force levels

In addition to the changes introduced in 1967, there are several other periods of noncomparability in the labor force data: (1) Beginning in 1953, as a result of introducing data from the 1950 census into the estimating procedures, population levels were raised by about 600,000 ; labor force, total employment, and agricultural employment were increased by about 350,000 , primarily affecting the figures for totals and men; other categories were relatively unaffected. (2) Beginning in 1960, the inclusion of Alaska and Hawaii resulted in an increase of about 500,000 in the population and about 300,000 in the labor force. Four-fifths of this increase was in nonagricultural employment; other labor force categories were not appreciably affected. (3) Beginning in 1962, the introduction of data from the 1960 census reduced the population by about 50,000 and labor force and employment by about 200,000; unemployment totals were virtually unchanged. (4) Beginning in 1972, information from the 1970 census was introduced into the estimation procedures, increasing the population by about 800,000 ; labor force and employment totals were raised by a little more than 300,000 ; and unemployment levels and rates were essentially unchanged. (5) A subsequent population adjustment based on the 1970 census was introduced in March 1973. This adjustment, which affected the white and black-and-other groups but had little effect on totals, resulted in the reduction of nearly 300,000 in the white population and an increase of the same magnitude in the black-and-other population. Civilian labor force and total employment figures were affected to a lesser degree; the white labor force was reduced by 150,000 , and the black-and-other labor force rose by about 210,000 . Unemployment levels and rates were not significantly affected.

In addition, beginning in January 1974, the methodology used to prepare independent estimates of the civilian noninstitutional population was modified to an inflation-deflation approach. This change in the derivation of the estimates had its greatest impact on estimates of 20- to 24-year old menparticularly those of the black-and-other population-but had little effect on estimates of the total population 16 years and over. Additional information on the adjustment procedure appears in "CPS Population Controls Derived from InflationDeflation Method of Estimation", in the February 1974 issue of Employment and Earnings.

Effective in July 1975, as a result of the immigration of Vietnamese refugees into the United States, the total and black-and-other independent population controls for persons 16 years and over were adjusted upward by $76,000-30,000$ men and 46,000 women. The addition of the refugees increased the black-and-other population by less than 1 percent in any age-sex group, and all of the changes were in the other population.

Beginning in January 1978, the introduction of an expansion in the sample and revisions in the estimation procedures resulted in an increase of about 250,000 in the civilian labor force and employment totals; unemployment levels and rates were essentially unchanged. An explanation of the procedural changes and an indication of the differences appear in "Revisions in the Current Population Survey in January 1978" in the February 1978 issue of Employment and Earnings.
Beginning in October 1978, the race of the individual was determined by the household respondent for the incoming rotation group households, rather than by the interviewer as before. The purpose of this change was to provide more accurate estimates of characteristics by race. Thus, in October 1978, one-eighth of the sample households had race determined by the household respondent and seven-eighths of the sample households had race determined by interviewer observation. It was not until January 1980 that the entire sample had race determined by the household respondent. The new procedure had no significant effect on the estimates.
Beginning in January 1979, the first-stage ratio estimation method was changed in the CPS estimation procedure. Differences between the old and new procedures existed only for metropolitan and nonmetropolitan area estimates, not for the total United States. The reasoning behind the change and an indication of the differences appear in "Revisions in the Current Population Survey in January 1979" in the February 1979 issue of Employment and Earnings.
Beginning in January 1982, the second-stage ratio adjustment methodology was changed in the CPS estimation procedure. The purpose of the change and an indication of its effect on national estimates of labor force characteristics appear in "Revisions in the Current Population Survey Beginning in January 1982" in the February 1982 issue of Employment and Earnings. In addition, current population estimates used in the second-stage estimation procedure are derived from information obtained from the 1980 census, rather than the 1970 census. This change caused substantial increases in total population and estimates of persons in all labor force categories. Rates for labor force characteristics, however, remained virtually unchanged. Some 30,000 labor force series were adjusted back to 1970 to avoid major breaks in series. The adjustment procedure used is also described in the February 1982 article cited above. The revisions did not, however, smooth out the breaks in series occurring between 1972 and 1979 that are described above, and data users should make allowances for them in making certain data comparisons.

Beginning in January 1983, the first-stage ratio adjustment methodology was updated to account for results obtained from the 1980 census. The purpose of the change and an indication of its effect on national estimates of labor force characteristics appear in "Revisions in the Current Population Survey Beginning in January 1983" in the February 1983 issue of Employment and Earnings. There
were only slight differences between the old and new procedures in estimates of levels for the various labor force characteristics and virtually no differences in estimates of participation rates.

Beginning in January 1985, most of the steps of the CPS estimation procedure-the noninterview adjustment, the first and second-stage ratio adjustments, and the composite estimator-were revised. These procedures are described in the Estimating Methods section. A description of the changes and an indication of their effect on national estimates of labor force characteristics appear in "Changes in the Estimation Procedure in the Current Population Survey Beginning in January 1985" in the February 1985 issue of this publication. Overall, the revisions had only a slight effect on most estimates. The greatest impact was on estimates of persons of Hispanic origin. Major estimates were revised back to January 1980.

Beginning in January 1986, the population controls used in the second-stage ratio adjustment methodology were revised to reflect an explicit estimate of the number of undocumented immigrants (largely Hispanic) since 1980 and an improved estimate of the number of emigrants among legal foreign-born residents for the same time period. As a result, the total civilian population and labor force estimates were raised by nearly 400,000 ; civilian employment was increased by about 350,000 . The Hispanicorigin civilian population and labor force estimates were raised by about 425,000 and 305,000 , respectively, and civilian employment by 270,000 . Overall and subgroup unemployment levels and rates were not significantly affected. Because of the magnitude of the adjustments for Hispanics, data have been revised back to January 1980 to the extent possible. An explanation of the changes and their effect on estimates of labor force characteristics appears in "Changes in the Estimation Procedure in the Current Population Survey Beginning in January 1986" in the February 1986 issue of this publication.

Beginning in August 1989, the second-stage ratio estimate cells were changed slightly to decrease the chance of very small cells occurring and to be more consistent with published age, sex, race cells. This change had virtually no effect on national estimates.

## Changes in the occupational and industrial classification system

Beginning in 1971, the comparability of occupational employment data was affected as a result of changes in the occupational classification system for the 1970 census that were introduced into the CPS. Comparability was further affected in December 1971, when a question relating to major activity or duties was added to the monthly CPS questionnaire in order to determine more precisely the occupational classification of individuals. As a result of these changes, meaningful comparisions of occupational employment levels could not be made between 1971-72 and prior years nor between those 2 years. Unemployment rates were not significantly affected. For a further explanation of the changes in the occupational classification sys-
tem, see "Revisions in Occupational Classifications for 1971" and "Revisions in the Current Population Survey" in the February 1971 and February 1972 issues, respectively, of Employment and Earnings.
Beginning in January 1983, the occupational and industrial classification systems used in the 1980 census were introduced into the CPS. The 1980 census occupational classification system evolved from the Standard Occupational Classification (SOC) and was so radically different in concept and nomenclature from the 1970 system that comparisons of historical data are not possible without major adjustments.
The industrial classification system used in the 1980 census was based on the 1972 Standard Industrial Classification system (SIC), as modified in 1977. The adoption of the new system had much less of an adverse effect on historical comparability than did the new occupational system.
Additional information on the 1980 census occupational and industrial classification systems, which were used in the CPS through December 1991, appears in "Revisions in the Current Population Survey Beginning in January 1983" in the February 1983 issue of Employment and Earnings.
Beginning in January 1992, the occupational and industrial classification systems used in the 1990 census were introduced into the CPS. There were a few breaks in comparability between the 1980 and 1990 census-based systems, particularly within the "technical, sales, and administrative support" categories. The industrial classification system used in the 1990 census is based on the 1987 Standard Industrial Classification system. The most notable changes from the 1980 system were the shift of several industries from "business services" to "professional services" and the splitting of some industries into smaller, more detailed categories. A number of industry titles were changed as well, with no change in content.

## Changes in the sample design

Since the inception of the survey, there have been various changes in the design of the CPS sample. Most of these changes were made in order to improve the efficiency of the sample design and/or to increase the reliability of the sample estimates.

One major change made after every decennial census is to change the sample design to make use of the recently collected census materials. Also, the number of sample areas and the number of sample persons are increased occasionally. In 1953, the current rotation plan was introduced, in which a sample unit is interviewed for 4 months, leaves the sample for 8 months, and then returns to the sample for another 4 months. When Alaska and Hawaii achieved statehood, three more sample areas were added to account for the population in these States. After the 1960 census, selection of a major portion of the sample from census address lists was begun, though a portion of the sample is still collected using area sampling. Following the 1970 census, the ultimate sampling unit was changed from a
noncontiguous cluster of six housing units to a usually contiguous cluster of four housing units. In January 1978, a supplemental sample of 9,000 housing units selected in 24 States and the District of Columbia and designed to provide more reliable annual average estimates for States, was incorporated into the design. In October 1978, a coverage improvement sample, composed of approximately 450 sample household units which represented 237,000 occupied mobile homes and 600,000 new construction housing units, was included in computing the estimates in order to provide coverage of mobile homes and new construction units that previously had no chance for selection in the CPS sample selected from the 1970 census frame. In January 1980, another supplemental sample of 9,000 households selected in 32 States and the District of Columbia was added to the existing sample. A sample reduction of about 6,000 units was implemented in May 1981. Beginning in January 1982, the sample was expanded by 100 households to provide additional coverage in counties added to SMSA's, which were redefined in 1973.
Beginning in 1985, a new State-based CPS sample was selected based on 1980 census information, providing an opportunity to improve the efficiency of the sample design and increase the reliability for State estimates. Sample households are chosen from 729 sample areas, which represent 1,973 geographic areas in the United States. This current number of sample areas is not completely comparable to the old number of sample areas since many of the sample areas have been redefined. (See pp. 7-10 of the May 1984 issue of Employment and Earnings, for an overview of these new definitions and the introduction of the new sample.) A sample reduction of about 4,000 households was implemented in April 1988; they were reinstated during the 8 -month period, April-November 1989.

Table A provides a description of some aspects of the CPS sample design in use during the different data collection periods. A more detailed account of the history of the CPS sample design appears in the Current Population Survey: Design and Methodology, Technical Paper No. 40, Bureau of the Census, or Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey, Report 463, Bureau of Labor Statistics.

## ESTIMATING METHODS

Under the estimating methods used in the CPS, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. The estimation procedure involves weighting the data from each sample person by the inverse of the probability of the person being in the sample. This gives a rough measure of the number of actual persons that the sample person represents. Beginning in 1985, almost all sample persons within the same State have the same probability of selection. These estimates are then adjusted for noninterviews, and the ratio estimation procedure is applied.

1. Noninterviw adjustment. The weights for all interviewed households are adjusted to the extent needed to account for occupied sample households for which no information was

| Time period | Number of sample areas | Households eligible |  | Households visited but not eligible |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Interviewed | Not interviewed |  |
| Aug. 1947 to Jan. 1954 | 68 | 21,000 | 500-1,000 | 3,000-3,500 |
| Feb. 1954 to Apr. 1956 | 230 | 21,000 | 500-1,000 | 3,000-3,500 |
| May 1956 to Dec. 1959 | 1330 | 33,500 | 1,500 | 6,000 |
| Jan. 1960 to Feb. 1963 | ${ }^{2} 333$ | 33,500 | 1,500 | 6,000 |
| Mar. 1963 to Dec. 1966 | 357 | 33,500 | 1,500 | 6,000 |
| Jan. 1967 to July 1971. | 449 | 48,000 | 2,000 | 8,500 |
| Aug. 1971 to July 1972 | 449 | 45,000 | 2,000 | 8,000 |
| Aug. 1972 to Dec. 1977 | 461 | 45,000 | 2,000 | 8,000 |
| Jan. 1978 to Dec. 1979 | 614 | 53,500 | 2,500 | 10,000 |
| Jan. 1980 to Apr. 1981 | 629 | 62,200 | 2,800 | 12,000 |
| May 1981 to Dec. 1984 | 629 | 57,800 | 2,500 | 11,000 |
| Jan. 1985 to Mar. 1988 | 729 | 57,000 | 2,500 | 11,000 |
| Apr. 1988 to Mar. 1989 | 729 | 53,200 | 2,600 | 11,500 |
| Nov. 1989 to present ${ }^{3}$. | 729 | 57,400 | 2,600 | 11,800 |

[^23]obtained because of absence, impassable roads, refusals, or unavailability of the respondents for other reasons. This noninterview adjustment is made separately by combinations of similar sample areas that are not necessarily contained within a State. Similarity of sample areas is based on Metropolitan Statistical Area (MSA) status and size. Within each combination of sample areas there is a further breakdown by residence. MSA sample areas are categorized by "central city" and "balance of the MSA." Residence categories of non-MSA areas are "urban"' and "rural." The proportion of sample households not interviewed varies from 4 to 5 percent, depending on weather, vacation, etc.
2. Ratio estimates. The distribution of the population selected for the sample may differ somewhat, by chance, from that of the population as a whole in such characteristics as age, race, sex, and residence. Since these characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the survey estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio estimates as follows:
a. First-stage ratio estimate. In the CPS, a portion of the 729 sample areas is chosen to represent other areas not in the sample; the remainder of the sample areas represent only themselves. The first-stage ratio estimation procedure was designed to reduce the portion of the variance resulting from requiring sample areas to represent nonsample areas. Therefore, this procedure is not applied to sample areas which represent only themselves. The adjustment is made at the State level for each of the 43 States which contains nonsample areas by race cells of black and non-black. The procedure corrects for differences that existed in each cell at the time of the 1980 census between the race distribution of the population in sample areas and the known race distribution of the State.

3 The sample was increased incrementally during the 8 -month period, AprilNovember 1989.
b. Second-stage ratio estimate. In this stage, the sample proportions of persons in specific categories are adjusted to the distribution of independent current estimates of the civilian noninstitutional population in the same categories. The second-stage ratio adjustment, which is performed to further reduce variability of the estimates and to correct to some extent for CPS undercoverage relative to the decennial census, is carried out in three steps. In the first step, the sample estimates are adjusted within each State and the District of Columbia to an independent control for the population 16 years and over. The second step involves an adjustment by Hispanic origin to a national estimate for eight age-sex categories by Hispanic and non-Hispanic. In the third step, a national adjustment is made by the race categories of white, black, and other races to independent estimates by age and sex. The white and black categories contain 38 and 24 agesex groups respectively; the other races category has 4 agesex cells. The entire second-stage adjustment procedure is iterated six times, each time beginning at the weights developed the previous time. This ensures that the sample estimates of the population for both State and national age-sex-race-origin categories will be virtually equal to the independent population control totals. This second-stage adjustment procedure incorporates changes instiuted in January 1985 and August 1989. The nature and effect of the 1985 changes are discussed in detail in "Changes in the Estimation Procedure in the Current Population Survey Beginning in January 1985"' in the February 1985 issue of Employment and Earnings.
The controls by State for the civilian noninstitutional population 16 years and over are an arithmetic extrapolation of the trend in the growth of this segment of the population using the two most recent July 1 estimates, adjusted as a last step to a current estimate of the U.S. population of this group. State estimates by age for July 1 are published annually in Current Population Reports, Series P-25. For a description of the methodology used in developing the State total, see Report 957 of that series. A description of the age
estimates methodology is available in Report 1010 of that series.
Prior to January 1985, there was no separate control for Hispanics in the second-stage ratio procedure. These Hispanic controls are prepared by carrying forward the 1980 census count for Hispanics by adding estimated Hispanic births and immigrants and subtracting estimated Hispanic deaths and emigrants to yield an estimate of the Hispanic population by age and sex.
During the period from January 1982 to December 1984, the "inflation-deflation" method was temporarily discontinued in the preparation of the independent national controls used for the age-sex-race groups in the third step of the second-stage ratio estimation procedure. These controls were prepared by carrying forward the 1980 census data after taking account of subsequent aging of the population, births, deaths, and net migration and then subtracting the estimate for the institutional population and Armed Forces. Beginning in January 1985, the "inflation-deflation" method of deriving independent population controls was reintroduced into the CPS estimation procedure. With the "inflationdeflation" method, the independent controls are prepared by inflating the 1980 census counts to include estimated undercounts by age, sex, and race, aging this population forward to each subsequent month and later age by adding births and net migration, and subtracting deaths. These post-censal population estimates are then deflated to census level to reflect the pattern of net undercount in the most recent census by age, sex, and race. Because an estimate of undercount is first added and then şubtracted, the size of each race-sex group is unaffected by the "inflation-deflation" method. Similarly, the final estimate is affected only by the age structure of the undercount, but not the level. This feature of the method is important since the exact amount of undercount in the 1980 census remains unknown.
Data on births and deaths between April 1, 1980, and the estimate date are based on tabulations of vital statistics for the resident population made by the National Center for Health Statistics and data on deaths of military personnel overseas from the Department of Defense. Estimates of net civilian immigration are based on data provided by the Immigration and Naturalization Service, the Department of Defense, the Office of Personnel Management, and the Puerto Rico Planning Board. The civilian noninstitutional population is derived by subtracting the Armed Forces and the institutional population for the estimate date from the total including Armed Forces overseas. The institutional population is computed by applying institutional proportions derived from the 1980 census to the total population, including Armed Forces overseas for the estimate date. All computations described above are performed in cells defined by single year of age, race, and sex. The independent national control totals are then obtained by collapsing these cells into broader age groups for the population 16 years and older.
Beginning in January 1986, two changes were introduced into the estimation of the independent population controls.

For the first time, an explicit allowance for net undocumented immigration since April 1, 1980 (the census date) was added to the estimated level of legal immigration. In addition, an increase in the estimate of emigration of legal foreignborn residents has been incorporated into the post-censal population estimates since 1980. The nature and effect of these changes are discussed in detail in "Changes in the Estimation Procedure in the Current Population Survey Beginning in January 1986" in the February 1986 issue of Employment and Earnings.
3. Composite estimate procedure. In deriving statistics for a given month, a composite estimating procedure is used which takes account of net changes from the previous month for continuing parts of the sample ( 75 percent), as well as the sample results for the current month. Also included is an additional term which is an estimate of the net difference between incoming and continuing parts of the current month's sample. Almost all estimates of month-to-month change are improved by this procedure, and most estimates of level are also improved, but to a lesser extent.

## Rounding of estimates

The sums of individual items may not always equal the totals shown in the same tables because of independent rounding of totals and components to the nearest thousand. Similarly, sums of percent distributions may not always equal 100 percent because of rounding. Differences, however, are insignificant.

## Reliability of the estimates

There are two types of errors possible in an estimate based on a sample survey-sampling and nonsampling. The standard errors provided primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration but do not measure any systematic biases in the data.

Nonsampling error. The full extent of nonsampling error is unknown, but special studies have been conducted to quantify some sources of nonsampling error in the CPS, as discussed below. The effect of nonsampling error should be small on estimates of relative change, such as month-tomonth change. Estimates of monthly levels would be more severely affected by the nonsampling error.

Nonsampling errors in surveys can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness of respondents to provide correct information, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all sample households and all persons within
sample households (undercoverage).
Nonsampling errors occurring in the interview phase of the survey have been studied by means of a reinterview program. This program is used to estimate various sources of error as well as to evaluate and control the work of the interviewers. A random sample of each interviewer's work is inspected through reinterview at regular intervals. The results indicate, among other things, that the data published from the CPS are subject to moderate systematic biases. A description of the CPS reinterview program and some of the other results may be found in the Current Population Survey Reinterview Program, January 1961 through December 1966, Technical Paper No. 19, Bureau of the Census, U.S. Department of Commerce.
The effects of some components of nonsampling error in the CPS data can be examined as a result of the rotation plan used for the sample, since the level of the estimates varies by rotation group. A description of these effects appears in "The Effects of Rotation Group Bias on Estimates From Panel Surveys," by Barbara A. Bailar, Journal of the American Statistical Association, Volume 70, No. 349, March 1975.
Undercoverage in the CPS results from missed housing units and missed persons within sample households. Compared to the level of the decennial census, undercoverage is about 6 percent. It is known that the CPS undercoverage varies with age, sex, race, and Hispanic origin. Generally, undercoverage is larger for men than for women, and larger for blacks, Hispanics, and other races combined than for whites. Ratio estimation to independent age-sex-race-origin population controls, as described previously, partially corrects for the biases due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race-origin group. Further, the independent population controls used have not been adjusted for undercoverage in the 1980 census.
Additional information on nonsampling error in the CPS appears in "An Error Profile: Employment as Measured by the Current Population Survey,"' by Camilla Brooks and Barbara Bailar, Statistical Policy Working Paper 3, U.S. Department of Commerce, Office of Federal Statistical Policy and Standards; in "The Current Population Survey: An Overview,'" by Marvin Thompson and Gary Shapiro, Annals of Economic and Social Measurement, Vol. 2, April 1973; and in The Current Population Survey, Design and Methodology, Technical Paper No. 40, Bureau of the Census, U.S. Department of Commerce. This last document includes a comprehensive discussion of various sources of errors, and describes attempts to measure them in the CPS.

Sampling error. The standard error is primarily a measure of sampling variability, that is, of the variation that occurs by chance because a sample rather than the entire population is surveyed. The sample estimate and its estimated
standard error enable one to construct confidence intervals, ranges that would include the average of all possible samples with a known probability. For example, if all possible samples were selected, each of these surveyed under essentially the same general conditions and using the same sample design, and an estimate and its estimated error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples.
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average of all possible samples.
3. Approximately 95 percent of the intervals from 2 standard errors below the estimate to 2 standard errors above the estimate would include the average result of all possible samples.

In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations are required. First, the standard errors in this volume reflect the sample design and estimation procedures in effect prior to the expansions for State estimates. Thus, these standard errors may slightly overstate the standard errors applicable to the present design. Second, instead of computing an individual standard error for each estimate, generalized sets of standard errors are computed for various types of characteristics. This generalization yields more stable estimates of the standard errors. Consequently, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.
Tables B and C show approximate standard errors for major employment status characteristics for monthly estimates and for changes for consecutive months. These standard errors are applicable to the level of the estimates in recent months.
Tables D through H provide generalized standard errors for monthly level and month-to-month change for estimated totals, unemployment rates, and percentages. Table I contains factors for use with table H for computing standard errors, as described below, for monthly level and month-tomonth change for percentages. Standard errors for intermediate values not shown in the table may be approximated by linear interpolation. The standard error for estimated changes from one month to the next is more closely related to the monthly level for the characteristic than to the size of the specific month-to-month change itself. Thus, in order to use the generalized standard errors for month-tomonth change as given in the tables of standard errors, it is necessary to obtain the monthly estimate for the characteristic. It should be noted that the tables of standard errors for month-to-month change apply only to estimates of

Table B. Standard errors for major employment status categories
(in thousands)

| Employment status, sex, age, and race | Standard error of- |  |
| :---: | :---: | :---: |
|  | Monthly level | Month-tomonth change (consecutive months only) |
| Total, 16 years and over: |  |  |
| Civilian labor force | 275 | 212 |
| Employed | 293 | 224 |
| Unemployed | 136 | 140 |
| Men, 20 years and over: |  |  |
| Civilian labor force | 173 | 151 |

| Employed | 76 | 54 |
| Unemployed | 45 | 48 |
| Both sexes, 16 to 19 years: |  |  |
| Civilian labor force | 36 | 40 |
| Employed | 33 | 38 |
| Unemployed | 30 | 33 |

change between 2 consecutive months. Estimates of change for nonconsecutive months are subject to higher standard errors. Table J contains factors for use with tables D, F, H, and I to compute approximate standard errors for levels, labor force participation rates, and percentages as pertaining to the year-to-year change of monthly estimates, quarterly averages, changes in quarterly averages, yearly averages, and changes in yearly averages. Note that standard errors for changes in quarterly and yearly estimates apply only to consecutive quarters and years. For years prior to 1967, the standard errors must be adjusted due to the differences in the sample size. For years prior to 1956, the standard errors should be multiplied by 1.50, and for the 1956-66 period, they should be multiplied by 1.22 . Table K provides generalized standard errors for quarterly estimates of persons and families for use with the CPS earnings data.

Standard errors for estimated totals. Tables D and E provide generalized standard errors for monthly totals and for month-to-month change. The figures given in these tables are to be used for the characteristics as indicated.

Illustration. Assume that in a given month the number of persons working a specific number of hours was $12,000,000$, an increase of 400,000 over the previous month. Linear interpolation in the second column of table $D$ shows that the standard error on an estimate of $12,000,000$ is about 174,000 . The 68-percent confidence interval as shown by these data is from $11,826,000$ to $12,174,000$. Therefore, a conclusion that the average estimate derived from all possible samples

Table C. Standard errors for unemployment rates by major characteristics

| Characteristic | Standard error of- |  | Characteristic | Standard error of- |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Monthly level | Consecutivemonth change |  | Monthly level | Consecutivemonth change |
| Total (all civilian workers) | 0.11 | 0.12 | Occupation-Continued |  |  |

lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Recall that the standard error of a month-to-month change is primarily dependent on the size of the monthly estimate. Thus, using linear interpolation in the first column of table E , the standard error on a month-to-month change of 400,000 , when the monthly level is approximately $12,000,000$, is about 129,000 .

Standard errors for rates and percentages. The reliability of an estimated unemployment rate or an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the rate or percentage and the total upon which the rate or percentage is based. Estimated rates and percentages are relatively more reliable than the corresponding estimates of the numerator of the rates or percentages; this is particularly true for percentages of 50 percent or more. As a general rule, percentages are not published when the monthly base is less than 75,000 , the quarterly average base is less than 60,000 , or the annual average base is less than 35,000 .
Tables $F$ and $G$ show generalized standard errors for monthly level and month-to-month change for unemployment rates. Generalized standard errors for estimated monthly percentages and estimated month-to-month change in percentage can be obtained through the use of the standard errors in table H and the factors in table I. First obtain the standard error from table H for the specific percentage and base.

The generalized standard error is then calculated by multiplying the standard error from table H by the appropriate factor from table I. When the numerator and denominator of the percentage are in different categories, use the factor indicated by the numerator of the percentage.

Illustration. Assume that in a given month 2.9 percent of a total of $112,440,000$ employed persons are employed in agriculture. The standard error on an estimate of 2.9 percent with a base of $112,440,000$ is obtained from table H ( 0.08 percent). The appropriate factor from table I for the numerator of the percentage, agricultural employment, is 1.26. The generalized standard error on the estimated 2.9 percent is then approximately $0.08 \times 1.26=0.10$ percentage point.

Standard errors for year-to-year change of monthly estimates, quarterly averages, changes in quarterly averages, yearly averages, and changes in yearly averages. The approximate standard errors of levels, rates, and percentages involving year-to-year change of monthly estimates, quarterly averages, changes in quarterly averages, yearly averages, and changes in yearly averages may be obtained by using table J in conjunction with the other tables. Standard errors for estimates of change are more closely related to the level of the estimate than to the size of the specific change. Thus, to obtain the standard error of an estimate of an average level, rate, or

Table D. Standard errors for estimates of monthly level

1 See footnote 1, table D.
2 Part-time labor force for unemployment also includes persons reentering
the labor force, persons who left their last job, and persons by duration of unemployment.
percentage, or an estimate of a change in level, rate, or percentage, it is first necessary to find the appropriate estimate of level. For an estimate of an average level, rate, or percentage, find the standard error of this estimate. For an estimate of change in level, rate, or percentage, find the standard error of the average of the two estimates affecting the change. Then, after computing the standard error by treating these estimates as monthly estimates and using the procedures above, multiply this result by a suitable factor from table $J$ to obtain the approximate standard error for the average or change.

Illustration. Suppose that one is interested in the year-to-year change of a monthly unemployment rate. Assume that for a certain month the unemployment rate is 6.2 percent, based on a total of $119,865,000$ in the civilian labor force, and that a year prior to this the unemployment rate was 7.0 percent, based on a total of $117,834,000$ in the civilian labor force for the month. First, the standard error on the average of the two estimates, 6.6 percent with a base of $118,850,000$, is obtained from table $F$ ( 0.11 percentage point). The appropriate factor, then, from table J is 1.40 . The approximate standard error on the change of 0.8 percent is then given by $0.11 \times 1.40=0.15$ percentage point.

The approximate standard error of levels involving year-to-year change of quarterly estimates pertaining to CPS earnings data for persons and families may be obtained by using table $K$ in conjunction with the following formula:

Standard
error of year-to-year change $=$

$$
\sqrt{\left(\begin{array}{c}
\text { Stand- } \\
\text { ard } \\
\text { error } \\
\mathbf{X}
\end{array}\right)+\left(\begin{array}{c}
\text { Stand- } \\
\text { ard } \\
\text { error } \\
\mathbf{Y}
\end{array}\right)-2(\mathbf{P}) \quad\left(\begin{array}{c}
\text { Stand- } \\
\text { ard } \\
\text { error } \\
\mathbf{X}
\end{array}\right) \quad\left(\begin{array}{c}
\text { Stand- } \\
\text { ard } \\
\text { error } \\
\mathbf{Y}
\end{array}\right)}
$$

X is the estimate for one quarter and Y is the estimate for another quarter. The coefficient, $P$, is a measure of the correlation between the estimates $X$ and $Y$ resulting from the presence of some of the same respondents in the sample for each estimate. For consecutive year-to-year changes of quarterly estimates, the values of P are 0.30 for persons (total, white, and black) and 0.35 for families (total, white, and black). The respective values for estimates of Hispanics are 0.45 and 0.55 .

Illustration. Assume that in a given quarter the number of women employed as full-time wage and salary workers was $27,000,000$ and in the same quarter a year later, their number had increased to $29,000,000$. Using linear interpolation in the eighth column of table $K$, the standard error of an estimate of $27,000,000$ is 216,000 ; for $29,000,000$ it is 221,000 . Using the above formula, the standard error of the $2,000,000$ year-to-year change is:

$$
\sqrt{(216,000)^{2}+(221,000)^{2}-2(0.30) \quad(216,000) \quad(221,000)}
$$

or about 259,000 .

# Establishment Data (Tables B-1 through C-8) 

## COLLECTION

Payroll reports provide current information on wage and salary employment, hours, and earnings in nonfarm establishments, by industry and geographic location. Historical statistics are published in Employment, Hours, and Earnings, United States, and Employment, Hours, and Earnings, States and Areas, and their supplements.

## Federal-State cooperation

Under cooperative arrangements, responding establishments report employment, hours, and earnings data to State agencies. State agencies mail the forms to the establishments and examine the returns for consistency, accuracy, and completeness. The States use the reported data to prepare State and area series and also send the reported data to the bLs (Washington Office) for use in preparing the national series. This avoids a duplicate reporting burden on establishments, and, together with the use of similar estimating techniques at the national and State levels, promotes increased comparability between estimates.

## Shuttle schedules

Form bls 790-Report on Employment, Payroll, and Hours is the name of the data collection schedule. The collection agency returns the schedule to the respondent each month so that the next month's data can be entered on the space allotted for that month. This "shuttle" procedure assures maximum comparability and accuracy of reporting, since the respondent can see the figures that have been reported for previous months.

Form bls 790 provides for entry of data on the total number of full- and part-time workers on the payrolls of nonfarm establishments and, for most industries, employment, payroll, and hours of production and related workers or nonsupervisory workers for the pay period which includes the 12th of the month.

## CONCEPTS

## Industrial classification

Establishments reporting on Form BLS 790 are classified into industries on the basis of their principal product or activity determined from information on annual sales volume. Since January 1980, this information is collected on a supplement to the quarterly unemployment insurance tax reports filed by employers. For an establishment making more than one product or engaging in more than one activity, the entire employment of the establishment is included under the
industry indicated by the principal product or activity.
All data on employment, hours, and earnings for the $\mathrm{Na}-$ tion (beginning with August 1990 data) and for States and areas (beginning with January 1990 data) are classified in accordance with the 1987 Standard Industrial Classification (SIC) Manual, Office of Management and Budget. The bls tabulates and estimates statistics which distinguish between private and public establishments, thus maintaining continuity with previously published statistics for the private and government sector.

## Industry employment

Employment data, except those for the Federal Government, refer to persons on establishment payrolls who received pay for any part of the pay period which includes the 12th of the month. For Federal Government establishments, employment figures represent the number of persons who occupied positions on the last day of the calendar month. Intermittent workers are counted if they performed any service during the month.

The data exclude proprietors, the self-employed, unpaid volunteer or family workers, farm workers, and domestic workers. Salaried officers of corporations are included. Government employment covers only civilian employees; military personnel are excluded. Employees of the Central Intelligence Agency and the National Security Agency are also excluded.

Persons on establishment payrolls who are on paid sick leave (when pay is received directly from the firm), on paid holiday, on paid vacation, or who work during a part of the pay period even though they are unemployed or on strike during the rest of the period are counted as employed. Not counted as employed are persons who are on layoff, on leave without pay, on strike for the entire period, or who were hired but have not yet reported during the period.

Indexes of diffusion of employment change (table B-7). These indexes measure the dispersion among industries of the change in employment over the specified time span. Beginning with August 1990 data, the overall indexes are calculated from 356 seasonally adjusted employment series (three-digit industries) covering all nonfarm payroll employment in the private sector. The manufacturing diffusion indexes are based on 139 three-digit industries.
To derive the indexes, each component industry is assigned a value of 0,50 , or 100 percent, depending on whether its employment showed a decrease, no change, or an increase, respectively, over the time span. The average value (mean) is then calculated, and this percent is the diffusion index number.
The reference point for diffusion analysis is 50 percent, the value which indicates that the same number of component
industries had increased as had decreased. Index numbers above 50 show that more industries had increasing employment, and values below 50 indicate that more had decreasing employment. The margin between the percent that increased and the percent that decreased is equal to the difference between the index and its complement, i.e., 100 minus the index. For example, an index of 65 percent means that 30 percent more industries had increasing employment than had decreasing employment ( $65-(100-65)=30)$. However, for dispersion analysis, the distance of the index number from the 50 -percent reference point is the most significant observation.
Although diffusion indexes are commonly interpreted as showing the percent of components that increased over the time span, it should be remembered that the index reflects half of the unchanged components as well. (This is the effect of assigning a value of 50 percent to the unchanged components when computing the index.)

## Industry hours and earnings

Average hours and earnings data are derived from reports of payrolls and hours for production and related workers in manufacturing and mining, construction workers in construction, and nonsupervisory employees in private serviceproducing industries.
Production and related workers include working supervisors and all nonsupervisory workers (including group leaders and trainees) engaged in fabricating, processing, assembling, inspecting, receiving, storing, handling, packing, warehousing, shipping, trucking, hauling, maintenance, repair, janitorial, guard services, product development, auxiliary production for plant's own use (e.g., power plant), recordkeeping, and other services closely associated with the above production operations.
Construction workers include the following employees in the construction division: Working supervisors, qualified craft workers, mechanics, apprentices, helpers, laborers, etc., engaged in new work, alterations, demolition, repair, maintenance, etc., whether working at the site of construction or working in shops or yards at jobs (such as precutting and preassembling) ordinarily performed by members of the construction trades.
Nonsupervisory employees include employees (not above the working supervisory level) such as office and clerical workers, repairers, salespersons, operators, drivers, physicians, lawyers, accountants, nurses, social workers, research aides, teachers, drafters, photographers, beauticians, musicians, restaurant workers, custodial workers, attendants, line installers and repairers, laborers, janitors, guards, and other employees at similar occupational levels whose services are closely associated with those of the employees listed.
Payroll covers the payroll for full- and part-time production, construction, or nonsupervisory workers who received pay for any part of the pay period which includes the 12th of the month. The payroll is reported before deductions of
any kind, e.g., for old-age and unemployment insurance, Group insurance, withholding tax, bonds, or union dues; also included is pay for overtime, holidays, vacation, and sick leave paid directly by the firm. Bonuses (unless earned and paid regularly each pay period); other pay not earned in the pay period reported (e.g., retroactive pay); tips; and the value of free rent, fuel, meals, or other payment in kind are excluded. "Fringe benefits" (such as health and other types of insurance, contributions to retirement, etc., paid by the employer) are also excluded.
Hours cover the hours paid for during the pay period which includes the 12th of the month for production, construction, or nonsupervisory workers. Included are hours paid for holidays, vacations, and for sick leave when pay is received directly from the firm.

Overtime hours cover hours worked by production or related workers for which overtime premiums were paid because the hours were in excess of the number of hours of either the straight-time workday or the workweek during the pay period which included the 12th of the month. Weekend and holiday hours are included only if overtime premiums were paid. Hours for which only shift differential, hazard, incentive, or other similar types of premiums were paid are excluded.

Average weekly hours. The workweek information relates to the average hours for which pay was received and is different from standard or scheduled hours. Such factors as unpaid absenteeism, labor turnover, part-time work, and stoppages cause average weekly hours to be lower than scheduled hours of work for an establishment. Group averages further reflect changes in the workweek of component industries.

Indexes of aggregate weekly hours. The indexes of aggregate weekly hours are prepared by dividing the current month's aggregate by the average of the 12 monthly figures for 1982. For basic industries, the hours aggregates are the product of average weekly hours and production worker or nonsupervisory worker employment. At all higher levels of industry aggregation, hours aggregates are the sum of the component aggregates.

Average overtime hours. The overtime hours represent that portion of the average weekly hours which exceeded regular hours and for which overtime premiums were paid. If an employee were to work on a paid holiday at regular rates, receiving as total compensation his or her holiday pay plus straight-time pay for hours worked that day, no overtime hours would be reported.
Since overtime hours are premium hours by definition, weekly hours and overtime hours do not necessarily move in the same direction from month to month. Such factors as work stoppages, absenteeism, and labor turnover may not have the same influence on overtime hours as on average hours. Diverse trends at the industry group level also may be caused by a marked change in hours for a component
industry where little or no overtime was worked in both the previous and current months.

Average hourly earnings. Average hourly earnings are on a "gross"' basis. They reflect not only changes in basic hourly and incentive wage rates but also such variable factors as premium pay for overtime and late-shift work and changes in output of workers paid on an incentive plan. They also reflect shifts in the number of employees between relatively high-paid and low-paid work and changes in workers' earnings in individual establishments. Averages for groups and divisions further reflect changes in average hourly earnings for individual industries.

Averages of hourly earnings differ from wage rates. Earnings are the actual return to the worker for a stated period of time; rates are the amount stipulated for a given unit of work or time. The earnings series do not measure the level of total labor costs on the part of the employer since the following are excluded: Irregular bonuses, retroactive items, payments of various welfare benefits, payroll taxes paid by employers, and earnings for those employees not covered under production worker, construction worker, or nonsupervisory employee definitions.

Average hourly earnings, including lump-sum wage payments. These series are compiled only for aircraft (SIC 3721 ) and guided missiles and space vehicles (SIC 3761) manufacturing. The same concepts and estimation methods apply to these series as apply to the average hourly earnings series described above; the one difference between the series is definitional. The payroll data used to calculate this series include lump-sum payments made to production workers in lieu of general wage rate increases; such payments are excluded from the definition of gross payrolls used to calculate the other average hourly earnings series.

For each sample establishment in SIC 3721 and SIC 3761 covered by a lump-sum agreement, the reported payroll data are adjusted to include a prorated portion of the lump-sum payment. Such payments are generally made once a year and cover the following 12 -month period. In order to spread the payment across this time period, a prorated portion of the payment is added to the payroll each month. This prorated portion is adjusted by an exit rate to reduce the lump-sum amount to account for persons who received the payment but left before the payment allocation period expired.

Average hourly earnings, excluding overtime. Average hourly earnings, excluding overtime premium pay are computed by dividing the total production worker payroll for the industry group by the sum of total production worker hours and one-half of total overtime hours. No adjustments are made for other premium payment'provisions, such as holiday work, late-shift work, and overtime rates other than time and one-half.

Railroad hours and earnings. The figures for Class I railroads (excluding switching and terminal companies) are based on
monthly data summarized in the M-300 report of the Interstate Commerce Commission and relate to all employees except executives, officials, and staff assistants (ICC group I) who received pay during the month. Average hourly earnings are computed by dividing total compensation by total hours paid for. Average weekly hours are obtained by dividing the total number of hours paid for, reduced to a weekly basis, by the number of employees, as defined above. Average weekly earnings are derived by multiplying average weekly hours by average hourly earnings.

Average weekly earnings. These estimates are derived by multiplying average weekly hours estimates by average hourly earnings estimates. Therefore, weekly earnings are affected not only by changes in average hourly earnings but also by changes in the length of the workweek. Monthly variations in such factors as the proportion of part-time workers, stoppages for varying reasons, labor turnover during the survey period, and absenteeism for which employees are not paid may cause the average workweek to fluctuate.

Long-term trends of average weekly earnings can be affected by structural changes in the makeup of the work force. For example, persistent long-term increases in the proportion of part-time workers in retail trade and many of the services industries have reduced average workweeks in these industries and have affected the average weekly earnings series.

Real earnings, or earnings in constant dollars, are calculated from the earnings averages for the current month using a deflator derived from the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-w).

## ESTIMATING METHODS

The principal features of the procedure used to estimate employment for the establishment statistics are (1) the use of the "link relative"' technique, which is a form of ratio estimation; (2) periodic adjustment of employment levels to new benchmarks; and (3) the use of size and regional stratification.

## The "link relative"' technique

From a sample composed of establishments reporting for both the previous and current months, the ratio of currentmonth employment to that of the previous month is computed. This is called a "link relative." The estimates of employment (all employees, including production and nonproduction workers together) for the current month are obtained by multiplying the estimates for the previous month by these 'link relatives.' In addition, bias correction factors are applied to most employment estimates each month. The size of the bias correction factors is determined from past benchmark comparisons. Beginning with data for April 1983, these factors are modified by changes in the
sample link relatives for the most recent quarter. Other features of the general procedures are described in table L .

## Size and regional stratification

A number of industries are stratified by size of establishment and/or by region, and the stratified production or nonsupervisory worker data are used to weight the hours and earnings for aggregation into broader industry groupings. Accordingly, the basic estimating cell for an employment, hours, or earnings series, as the term is used in the summary of computational methods in table L, may be a whole industry or
a size stratum, a region stratum, or a size stratum of a region within an industry.

## Benchmark adjustments

Employment estimates are compared periodically with benchmarks (comprehensive counts of employment) for the various nonfarm industries, and appropriate adjustments are made as indicated. The industry estimates are currently projected from March 1991 levels. Benchmark adjustments are made annually.

The primary sources of benchmark information are

Table L. Summary of methods for computing industry statistics on employment, hours, and earnings

| Employment, hours, and earnings | Basic estimating cell (industry, region, size, or region/size cell) | Aggregate industry level (division and, where stratified, industry) |
| :---: | :---: | :---: |
|  | Monthly data |  |
| All employees | All-employee estimate for previous month multiplied by ratio of all employees in current month to all employees in previous month, for sample establishments which reported for both months. ${ }^{1}$ | Sum of all-employee estimates for component cells. |
| Production or nonsupervisory workers, women employees | All-employee estimate for current month multiplied by <br> (1) ratio of production or nonsupervisory workers to all employees in sample establishments for current month, (2) estimated ratio of women to all employees. ${ }^{2}$ | Sum of production or nonsupervisory worker estimates, or estimates of women employees, for component cells. |
| Average weekly hours | Production or nonsupervisory worker hours divided by number of production or nonsupervisory workers. ${ }^{2}$ | Average, weighted by production or nonsupervisory worker employment, of the average weekly hours for component cells. |
| Average weekly overtime hours | Production worker overtime hours divided by number of production workers. ${ }^{2}$ | Average, weighted by production worker employment, of the average weekly overtime hours for component cells. |
| Average hourly earnings . . . . | Total production or nonsupervisory worker payroll divided by total production or nonsupervisory worker hours. ${ }^{2}$ | Average, weighted by aggregate hours, of the average hourly earnings for component cells. |
| Average weekly earnings..... | Product of average weekly hours and average hourly earnings. | Product of average weekly hours and average hourly earnings. |
|  | Annual average data |  |
| All employees, women employees, and production or nonsupervisory workers | Sum of monthly estimates divided by 12. | Sum of monthly estimates divided by 12. |
| Average weekly hours | Annual total of aggregate hours (production or nonsupervisory worker employment muttiplied by average weekly hours) divided by annual sum of employment | Annual total of aggregate hours for production or nonsupervisory workers divided by annual sum of employment for these workers. |
| Average weekly overtime hours.... . | Annual total of aggregate overtime hours (production worker employment multiplied by average weekly overtime hours) divided by annual sum of employment. | Annual total of aggregate overtime hours for production workers divided by annual sum of employment for these workers. |
| Average hourly earnings | Annual total of aggregate payrolls (product of production or nonsupervisory worker employment by weekly hours and hourly earnings) divided by annual aggregate hours. | Annual total of aggregate payrolls divided by annual aggregate hours. |
| Average weekly earnings | Product of average weekly hours and average hourly earnings. | Product of average weekly hours and average hourly earnings. |

[^25]a wedging technique designed to compensate for changes in the sample arising mainly from the voluntary character of the reporting. The wedging procedure accepts the advantage of continuity from the use of the matched sample and, at the same time, tapers or wedges the estimate toward the level of the latest sample average.
employment data, by industry, compiled quarterly by State agencies from reports of establishments covered under State unemployment insurance laws. These tabulations cover about 98 percent of employees on nonfarm payrolls in the United States. Benchmark data for the residual are obtained from the records of the Social Security Administration, the Interstate Commerce Commission, and a number of other agencies in private industry or government.
The estimates for the benchmark month are compared with new benchmark levels, industry by industry. If revisions are necessary, the monthly series of estimates between benchmark periods are adjusted between the new benchmark and the preceding one, and the new benchmark for each industry is then carried forward progressively to the current month by use of the sample trends. Thus, under this procedure, the benchmark is used to establish the level of employment; the sample is used to measure the month-to-month changes in the level. A comparison of the actual amounts of revisions made at the time of the March 1991 benchmark adjustment is shown in table M .

Normally, data for all months since the last benchmark to which the series has been adjusted are subject to revision. Revised data are published as soon as possible after each benchmark revision.

## THE SAMPLE

## Design

The sampling plan used in the establishment survey is known as "sampling proportionate to average size of establishment." This design is an optimum allocation design among strata since the sampling variance is proportional to the average size of establishments. Under this type of design, large establishments fall into the sample with certainty. The size of the sample for the various industries is determined empirically on the basis of experience and of cost considerations. In a manufacturing industry in which a high proportion of total employment is concentrated in relatively few establishments, a larger percent of total employment is
Table M. Comparison of nonfarm employment benchmarks and estimates for March 1991
(Numbers in thousands)

| Industry | Benchmark | Estimate | Difference |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Level | Percent |
| Total | 107,507 | 108.147 | -640 | -0.6 |
| Mining | 695 | 699 | -4 | -. 6 |
| Construction | 4,356 | 4,366 | -10 | -. 2 |
| Manufacturing . | 18,339 | 18,316 | 23 | . 1 |
| Transportation and public utilities | 5,707 | 5,764 | -57 | -1.0 |
| Wholesale trade | 6,050 | 6,063 | -13 | -. 2 |
| Retail trade | 18,934 | 18,990 | -56 | -. 3 |
| Finance, insurance, and real estate | 6,656 | 6,685 | -29 | -. 4 |
| Services | 28,053 | 28,490 | -437 | -1.6 |
| Government | 18,717 | 18,774 | -57 | -. 3 |

included in the sample. Consequently, the sample design for such industries provides for a complete census of the large establishments with only a few chosen from among the smaller establishments or none at all if the concentration of employment is great enough. On the other hand, in an industry in which a large proportion of total employment is in small establishments, the sample design calls for inclusion of all large establishments and also for a substantial number of the small ones. Many industries in the trade and services divisions fall into this category. To keep the sample to a size which can be handled by available resources, it is necessary to design samples for these industries with a smaller proportion of universe employment than is the case for most manufacturing industries. Since individual establishments in these nonmanufacturing divisions generally show less fluctuation from regular cyclical or seasonal patterns than do establishments in manufacturing industries, these smaller samples (in terms of employment) generally produce reliable estimates.
In the context of the BLS establishment survey program, with its emphasis on producing timely data at minimum cost, a sample must be obtained which will provide coverage of a sufficiently large segment of the universe to provide reasonably reliable estimates that can be published promptly and regularly. The present sample meets these specifications for most industries. With its use, the BLS is able to produce preliminary estimates each month for many industries and for many geographic levels within a few weeks after the reference period, and, at a somewhat late date, statistics in considerably greater industrial detail.

## Coverage

The bLS sample of establishment employment and payrolls is the largest monthly sampling operation in the field of social statistics. Table N shows the latest benchmarks and the approximate proportion of total employment in each industry division covered by the group of establishments furnishing monthly employment data. The coverage for individual industries within the division may vary from the proportions shown.

## Reliability

Although the relatively large size of the BLS establishment sample assures a high degree of accuracy, the estimates derived from it may differ from the figures that would be obtained if it were possible to take a complete census using the same schedules and procedures. As discussed under the previous section, a link relative technique is used to estimate employment. This requires the use of the previous month's estimate as the base in computing the current month's estimate. Thus, small sampling and response errors may accumulate over several months. To remove this accumulated error, the estimates are adjusted annually to new benchmarks. In addition to taking account of sampling and

Table N. Employment benchmarks and approximate coverage of BLS employment and payrolls sample, March 1991

| Industry | Benchmarks (thousands) | Sample coverage ${ }^{1}$ |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Number of establishments | Employees |  |
|  |  |  | Number (thousands) | Percent of benchmarks |
| Total | 107,507 | 300,138 | 40,969 | 38 |
| Mining | 695 | 3,518 | 257 | 37 |
| Construction | 4,356 | 26,367 | 860 | 20 |
| Manufacturing . | 18,339 | 55,254 | 8,884 | 48 |
| Transportation and public utilities | 5,707 | 215,598 | 22,425 | 42 |
| Wholesale trade | 6,050 | 25,379 | 1,136 | 19 |
| Retail trade | 18,934 | 59,471 | 4,330 | 23 |
| Finance, insurance, and real estate . | 6,656 | 22,065 | 2,166 | 33 |
| Services ... Government: | 28,053 | 70,075 | 6,852 | 24 |
| Federal | 2,939 | ${ }^{(3)}$ | 2,939 | 100 |
| State | 4,476 | 5,446 | 3,769 | 84 |
| Local | 11,302 | 16,965 | 7,351 | 65 |

${ }^{1}$ Counts reflect reports used in final estimates. Since not all establishments report payroll and hours information, hours and earnings estimates are based on a smaller sample than employment estimates.
${ }^{2}$ The Interstate Commerce Commission provides a complete count of employment for Class I railroads. A small sample is used to estimate hours and earnings data.
${ }^{3}$ Total Federal employment counts by agency for use in national estimates are provided to BLS by the Office of Personnel Management. Detailed industry estimates for the Executive Branch, as well as State and area estimates of Federal employment, are based on a sample of 6,000 reports covering about 64 percent of employment in Federal establishments.

${ }^{1}$ The average percent revision in employment for the 1986-90 benchmarks.
${ }^{2}$ Relative errors relate to 1982 data.
${ }^{3}$ Data for government are based on a total count for Federal Government provided by the Office of Personnel Management and a sample of State and local government reports.
response errors, the benchmark revision adjusts the estimates for changes in the industrial classification of individual establishments (resulting from changes in their product which are not reflected in the levels of estimates until the data are adjusted to new benchmarks). In fact, at the more detailed industry levels, particularly within manufacturing, changes
in classification are the major cause of benchmark adjustments. Another cause of differences arises from improvements in the quality of the benchmark data. Table $O$ presents the average percent revisions of the five most recent benchmarks for major industry divisions. Detailed descriptions of individual benchmark revisions are available from the Bureau upon request.

The hours and earnings estimates for basic estimating cells are not subject to benchmark revisions, although the broader groupings may be affected slightly by changes in employment weights. The hours and earnings estimates, however, are subject to sampling errors, which may be expressed as relative errors of the estimates. (A relative error is a standard error expressed as a percent of the estimate.) Relative errors for major industries are presented in table O and for individual industries with the specified number of employees in table P. The chances are about 2 out of 3 that the hours and earnings estimates from the sample would differ by a smaller percentage than the relative error from the averages that would have been obtained from a complete census.

One measure of the reliability of the employment estimates for individual industries is the root-mean-square error (RMSE). The measure is the standard deviation adjusted for the bias in estimates:

$$
\text { RMSE }=\sqrt{\text { (standard deviation) }^{2}+\text { (bias }^{2}}
$$

If the bias is small, the chances are about 2 out of 3 that an estimate from the sample would differ from its benchmark by less than the root-mean-square error. The chances are about 19 out of 20 that the difference would be less than twice the root-mean-square error.

Approximations of the root-mean-square errors (based on the most recent benchmark revisions) of differences between final estimates and benchmarks are presented in table P.

For the two most recent months, estimates of employment, hours, and earnings are preliminary and are so footnoted in the tables. These figures are based on less than the total sample and are revised when all the reports in the sample have been received.

Table P. Root-mean-square errors of differences between benchmarks and estimates of employment and average relative errors for average weekly hours and average hourly earnings

| Size of employment estimate | Root-meansquare error of employment estimates ${ }^{1}$ | Relative error ${ }^{2}$ (in percent) |  |
| :---: | :---: | :---: | :---: |
|  |  | Average weekly hours | Average hourly earnings |

# Productivity Data <br> (Tables C-9 through C-11) 

## COLLECTION

Productivity data are compiled by the Bureau of Labor Statistics from establishment and household survey labor input data and from measures of compensation and output supplied by the U.S. Department of Commerce and the Federal Reserve Board.

## CONCEPTS

Hours of wage and salary workers in nonagricultural establishments (table C-9) refer to hours paid for all employees-production workers, nonsupervisory workers, and salaried workers. For productivity and cost measures (tables C-10, 11), hours of all persons include hours of employees, proprietors, and unpaid family workers. Labor input is measured by hours at the work site.

Output is the constant-dollar market value of final goods and services produced in a given period. Indexes of output per hour of all persons (productivity) measure changes in the volume of goods and services produced per hour at work.

Compensation per hour includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. The data also inclete an estimate of wages, salaries, and supplementary payments for the selfemployed, except for nonfinancial corporations, in which there are no self-employed.

Real compensation per hour is compensation per hour adjusted by the Consumer Price Index for All Urban Consumers (CPI-U).

Unit labor costs measure the labor compensation cost required to produce one unit of output and are derived by dividing compensation per hour by output per hour.

Unit nonlabor payments include profits, capital consump-
tion allowances, interest, rental income of persons, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current-dollar gross product originating in the sector and dividing by output. In these tables, unit nonlabor costs contain all the components of unit nonlabor payments except unit profits.

Unit profits include corporate profits and inventory valuation and capital consumption adjustments per unit of output.

The implicit price deflator is derived by dividing the current-dollar estimate of gross product by the constantdollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

## NOTES ON THE DATA

For the business sector and the nonfarm business sector, these indexes relate to the gross domestic product less general government, households and institutions, owner-occupied housing, and the statistical discrepancy. For the nonfinancial corporate sector, the indexes refer to the gross domestic product of nonfinancial corporate business. All measures are seasonally adjusted.

Manufacturing output data are supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly measures have been adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis.

Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics. Historical statistics for most productivity measures appear in Trends in Multifactor Productivity, 1948-81, BLS Bulletin 2178. Additional information may be obtained from the Office of Productivity and Technology (202-523-9261).

## State and Area Labor Force Data ( D table)

## FEDERAL-STATE COOPERATIVE PROGRAM

Labor force and unemployment estimates for States, labor market areas (LMA's), and other areas covered under Federal assistance programs are developed by State employment security agencies under a Federal-State cooperative program. The local unemployment estimates which are derived from standardized procedures developed by BLS are the basis for determining eligibility of an area for benefits under Federal programs such as the Job Training and Partnership Act, the Economic Dislocation and Worker Adjustment Assistance Act, and the Urban Development Action Grant program.

Annual average data for the States and areas shown in table

D are published in Employment and Earnings (usually the May issue). For regions, States, selected metropolitan areas, and central cities, annual average data classified by selected demographic, social, and economic characteristics are published in the BLS bulletin, Geographic Profile of Employment and Unemployment.

Labor force estimates for counties, cities, and other small areas have been prepared for administration of various Federal economic assistance programs and may be ordered from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. The report "Unemployment in States and Local Areas" is published monthly through GPO and is available in microfiche form only, on a subscription basis.

## ESTIMATING METHODS

Monthly labor force, employment, and unemployment estimates are prepared for the 50 States, the District of Columbia, and over 2,600 labor market areas. The estimation methods are described below for States (and the District of Columbia) and for sub-State areas. A more detailed description of the estimation procedure is contained in the bls document, "Manual for Developing Local Area Unemployment Statistics."

## Estimates for States

Current monthly estimates. The civilian labor force and unemployment estimates for the 11 large States-California, Florida, Illinois, Massachusetts, Michigan, New Jersey, New York, North Carolina, Ohio, Pennsylvania, and Texas-are sufficiently reliable to be taken directly from the Current Population Survey (CPS) on a monthly basis. These are termed "direct-use States." For a description of the CPS concepts, see "Household Data," above.
For the 39 smaller States and the District of Columbia, which do not use the CPS directly each month, regression models (sets of equations) are used to develop employment and unemployment estimates. These, then, are the "non-direct-use" States. The regression techniques are based on historical and current relationships found within each State's economy as reflected in the different sources of data that are available for each State-the CPS, the Current Employment Statistics (CES) survey, and the unemployment insurance (UI) system. When the estimation procedures were introduced in 1989, over 10 years of data were used to develop the equations for each State. While all the State models have important variables in common, they differ somewhat from one another so as to better reflect individual State characteristics.
Two models-one for employment and one for the unemployment rate-are used for each State. The unemployment rate, rather than the unemployment level, is modeled, primarily because the rate is usually more meaningful for economic analysis.

The employment models use the CES estimates of nonfarm wage and salary jobs and also include data for employed persons not covered or only partially covered by the CES survey. Typically, these are agricultural workers, the selfemployed, unpaid family workers, and private household workers.

The unemployment rate models also include different types of data. Data for UI claimants (without earnings due to employment) are used to represent most of the experienced unemployed. The models also include an employment-topopulation ratio which reflects both the business cycle and the experienced unemployed not covered by the Ui claims data. New entrants and reentrants into the labor force are also reflected in the models. For some States, the models include variables which reflect seasonal factors not reflected in the other data used, such as the large increase in the labor force at the end of the school year.

In both the employment and unemployment rate models,
an important feature is the use of a technique that allows the equations to adjust automatically to structural changes that occur. The models are termed "variable coefficient models" because they include a built-in tuning mechanism, known as the Kalman Filter, which revises a model's coefficients when the new data that become available each month indicate that changes in the data relationships have taken place. Once the estimates are developed from the models, the unemployment level and labor force estimates are calculated.

Benchmark correction procedures. Once each year, monthly estimates for the 39 non-direct-use States and the District of Columbia are adjusted, or benchmarked, by BLS to the annual average CPS estimates. The benchmarking technique employs a procedure (called the Denton method) which adjusts the annual average of the models to equal the CPS annual average, while preserving, as much as possible, the original monthly seasonal pattern of the model estimates.

In the 11 direct-use States, no benchmark correction is required, as the average of the 12 monthly State CPS estimates will equal the CPS annual averages.

## Estimates for sub-State areas

Monthly labor force and employment estimates for two large sub-State areas-New York City and the Los AngelesLong Beach metropolitan area-are obtained directly from the CPS. Estimates for all other sub-State areas, more than 2,600 labor market areas (LMA's), are prepared through indirect estimation techniques, described below.

Preliminary estimate-employment. The total civilian employment estimates are based on CES data. These "place-of-work" estimates must be adjusted to refer to place-ofresidence as used in the CPS. Factors for adjusting from place-of-work to place-of-residence have been developed for several categories of employment on the basis of employment relationships at the time of the 1980 decennial census. These factors are applied to the CES estimates for the current period to obtain adjusted employment estimates, to which are added estimates for employment not represented in the CESagriculture, nonagricultural self-employed and unpaid family workers, and private household workers.

Preliminary estimate-unemployment. In the current month, the estimate of unemployment is an aggregate of the estimates for each of three categories: (1) persons who were previously employed in industries covered by State UI laws; (2) those previously employed in industries not covered by these laws; and (3) those who were entering the civilian labor force for the first time or reentering after a period of separation.

Sub-State adjustment for additivity. Estimates of employment and unemployment are prepared for the State and LMA's within the State. The LMA estimates geographically exhaust the entire State. Thus, a proportional adjustment must be applied to all sub-State LMA estimates to ensure that they add to the independently estimated State totals for employment and unemployment.

Benchmark correction. At the end of each year, sub-State estimates are revised. The revisions incorporate any changes in the inputs, such as revisions in the CES-based employment figures, corrections in claims counts, and updated historical
relationships. The corrected estimates are then readjusted to add to the revised (benchmarked) State estimates of employment and unemployment.

## Seasonal Adjustment

Over the course of a year, the size of the Nation's labor force, the levels of employment and unemployment, and other measures of labor market activity undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make it easier to observe the cyclical and other nonseasonal movements in the series. In evaluating changes in a seasonally adjusted series, it is important to note that seasonal adjustment is merely an approximation based on past experience. Seasonally adjusted estimates have a broader margin of possible error than the original data on which they are based, since they are subject not only to sampling and other errors but are also affected by the uncertainties of the seasonal adjustment process itself. Seasonally adjusted series for selected labor force and establishment-based data are published monthly in Employment and Earnings.

Since January 1980, national labor force data have been seasonally adjusted with a procedure called X-11 ARIMA (Auto-Regressive Integrated Moving Average), which was developed at Statistics Canada as an extension of the standard X-11 method. A detailed description of the procedure appears in The X-11 arima Seasonal Adjustment Method by Estela Bee Dagum, Statistics Canada Catalogue No. 12-564E, January 1983.

At the beginning of each calendar year, projected seasonal adjustment factors are calculated for use during the JanuaryJune period. In July of each year, BLS calculates and publishes in Employment and Earnings projected seasonal adjustment factors for use in the second half, based on the experience through June. Revisions of historical data for the most recent 5 years are made only at the beginning of each calendar year. However, as a result of the revisions to the estimates for 1970-81 based on 1980 census population counts, revisions to seasonally adjusted series in early 1982 were carried back to 1970 .
All labor force and unemployment rate statistics, as well as the major employment and unemployment estimates, are computed by aggregating independently adjusted series. For example, for each of the three major labor force com-ponents-agricultural employment, nonagricultural employment, and unemployment-data for four sex-age groups (men and women under and over 20 years of age)
are separately adjusted for seasonal variation and are then added to derive seasonally adjusted total figures. The seasonally adjusted figure for the labor force is a sum of eight seasonally adjusted civilian employment components, plus the resident Armed Forces total (not adjusted for seasonality), and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the overall unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the labor force. Because of the independent seasonal adjustment of various series, components will not necessarily add to totals.

Revised seasonally adjusted data for selected labor force series based on the experience through December, new seasonal adjustment factors to be used to calculate the civilian unemployment rate for the first 6 months of the following year, and a description of the current seasonal adjustment procedure are published in each January issue of Employment and Earnings. Revised seasonally adjusted data covering the revision period for a broader range of labor force series are published in the February issue of this publication.

Since the early 1980's, the BLS has also used the X-11 ARIMA procedure to seasonally adjust establishment-based employment, hours, and earnings data. The X-11 ARIMA program has been run once each year after benchmarking and seasonal adjustment factors have been projected and published for 12 months ahead (April-March). Beginning in June 1989, with the introduction of the March 1988 benchmarks, the Bureau introduced a modification to this procedure to parallel that used in seasonally adjusting household survey data. Projected seasonal adjustment factors are calculated and published twice a year. Revisions of historical data will continue to be made once a year, coincident with benchmark revisions.

All series are seasonally adjusted using the multiplicative models under X-11 arima. Seasonal adjustment factors are directly applied to the component levels. Seasonally adjusted totals for most of these series are then obtained by taking a weighted average of the seasonally adjusted data for the component series.

Seasonally adjusted average weekly earnings are the product of seasonally adjusted average hourly earnings and seasonally adjusted average weekly hours. Average weekly earnings in constant dollars, seasonally adjusted, are obtained by dividing average weekly earnings, seasonally adjusted, by the seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W), and
multiplying by 100 . Indexes of aggregate weekly hours, seasonally adjusted, are obtained by multiplying average weekly hours, seasonally adjusted, by production or nonsupervisory workers, seasonally adjusted, and dividing by the 1982 annual average base. For total private, total goods-producing, total private service-producing, and major industry divisions, the indexes of aggregate weekly hours, seasonally adjusted, are obtained by summing the aggregate weekly hours, seasonally adjusted, for the appropriate component industries and dividing by the 1982 annual average base.
Seasonally adjusted data are not published for a number of series characterized by small seasonal components relative to their trend-cycle and/or irregular components. These failed or unsatisfactory seasonally adjusted series, however, are used in the aggregation to broader level seasonally adjusted series.
Seasonal adjustment factors for Federal Government employment are derived from unadjusted data which include Christmas temporary workers employed by the Postal Service. The number of temporary census workers for the
decennial census, however, are removed prior to the calculation of seasonal adjustment factors.

BLS has developed an extension of X-11 ARIMA to allow it to adjust more adequately for the effects of the presence or absence of religious holidays in the April survey reference period and of Labor Day in the September reference period. This extension was applied for the first time at the end of 1989 to three persons-at-work labor force series which tested as having significant and well-defined effects in their April data associated with the timing of Easter. This extension was also used for the seasonal adjustment of many of the establish-ment-based series on average weekly hours and manufacturing overtime hours, starting with the computation of the projected factors for the period beginning in April 1990.

Revised seasonally adjusted establishment-based series based on the experience through March 1992, new seasonal adjustment factors for May-October 1992, and a description of the current seasonal adjustment procedure appear in the June 1992 issue of Employment and Earnings.

[^0]:    ${ }^{1}$ The latest supplement was published in July 1991.
