# Developments in 1970:

## The battle against inflation

Inflation has been the nation's number one economic problem for several years. All major price indicators show the emergence and growing dimensions of inflation since the midsixties. The wholesale and consumer price indexes, for example, mirror changes that contrast sharply with the comparatively stable prices of the early 1960's.

From 1960 through 1965, wholesale prices increased at an average annual rate of 0.3 percent and consumer prices increased at an average rate of 1.4 percent. While this upward drift was far from perfect price stability, it was gentle enough to be well within tolerable limits.

The main thrust of discretionary monetary and fiscal policy during those early years of the 1960's was aimed at stimulating aggregate spending to bring the economy up to its full-employment potential. By mid-decade, consumer spending and private investment were expanding rapidly when, largely as a result of the escalation of the war in Vietnam, Government spending also surged. Aggregate demand began to outstrip the nation's capacity to produce, and the economy became overheated.

While much of the booming demand was satisfied by increases in real output, the excess demand simply pulled prices upward. Since 1966, the wholesale price index has advanced at an average annual rate of 2.8 percent and the consumer price index has risen at an average rate of 4.3 percent.

More important than these high average increases, however, has been the accelerating rate of increase. The only respite from progressively sharper price increases came in 1967, when

under the delayed influence of monetary restraint, rises in both the wholesale and consumer price indexes temporarily moderated.

### Strategy of restraint

In the face of progressively faster rates of price increases, discretionary policy since the midsixties has been aimed at curtailing aggregate spending in hopes of slowing the rate of price increase. Policy actions have included periods of monetary restraint (1966 and 1969-70), the Federal income tax surcharge (1968-70), and continuing efforts since 1968 to contain if not cut Federal spending, especially for defense. Most recently, the President has formed a National Commission on Productivity to investigate means of increasing the nation's output per man-hour and directed the Council of Economic Advisers to prepare a periodic "inflation alert." The first alert was issued in early August.

### Price increases accelerate

The 1970 changes are based on the January-June averages compared with the January-June 1969 averages.

SOURCE: U.S. Department of Labor.

Although evidence indicates that inflation was not brought under control in the first half of 1970, there are hopeful signs that inflationary forces may have finally passed their peak. With the economy slowed and slack developing, the rate of price increase should diminish in the months ahead.

Meanwhile, the slowdown itself is causing some concern. The slowdown, which has raised unemployment from 3.5 percent of the labor force at the end of 1969 to 5.0 percent in July 1970, cannot be separated from the problem of inflation, however. Being the result of fiscal and monetary efforts to combat inflation by slowing growth in aggregate demand, the rise in unemployment and the general moderation

in business activity derive from the inflationary malaise that permeates the economy.

The restrictive monetary and fiscal actions taken last year and partly maintained into this year have been widely recognized as forces that would eventually slow economic activity. The Government itself has taken the official position (in the Economic Report of the President, for example) that the rate of economic expansion would have to be slowed. And evidence of this slowing in the second half of 1969 was generally viewed as good news. While the side effects of the economic slowdown present new problems, there is no doubt that the slowdown has been considered an essential part of the struggle against inflation.

---

## Prices in Dallas and Houston

Dallas and Houston are the only areas in the Eleventh District for which consumer prices are reported separately from the total for the nation. Until last year, consumer prices in these two cities increased at about the same rate as in metropolitan areas across the country. But last year, consumer prices in Dallas and Houston increased an average of 6.5 percent—1.1 percentage points faster than the average for all U.S. cities.

In the latest three-month periods for which detailed data are available, the rates of increase in both cities slowed to less than the national average. In Dallas, the annual rate of increase from March through May was 4.8 percent. In Houston, from May through July, it was 2.4 percent.

Food prices, which have tended to fluctuate more than the consumer price index as a whole, rose sharply in these two Texas

cities in the first quarter of this year, as they did in the nation as a whole, advancing at annual rates of 9.6 percent in Houston and 8.5 percent in Dallas. There was a marked slowing in the second quarter, however—to 2.1 percent in Houston and 1.0 percent in Dallas. These slower rates of increase—both less than the national average—seem to offer both cities hope for near-stability in food prices in the second half of 1970.

To the extent that consumers in these Texas cities have taken more of their meals at home, they have been able to resist the increase in family food bills. Prices for food at home have not increased as fast as prices for food away from home. In Houston, prices for food at home averaged 3.3 percent higher in June than a year before, compared with 11.5 percent for food away from home. In Dallas, these prices were up 3.8 percent and 7.9 percent, respectively.

Much of the agony of 1970 results from the economy slowing but inflation showing only a few signs of moderating. On the average, prices increased slightly faster in the first half of 1970 than in 1969. In the first six months of this year, the wholesale price index averaged 4.2 percent higher than in the same period last year. The consumer price index was up 6.2 percent. The steady slowing in business activity and the accompanying rise in unemployment might have seemed less uncomfortable had there been clear evidence that inflation was being wrung out of the economy.

### *Prices at the wholesale level*

Wholesale prices were almost stable during the first half of the 1960's, averaging only 2.5 percent higher in 1965 than during the 1957-59 period on which the index is based. In 1966, however, average wholesale prices jumped 3.3 percent over the average for 1965. With some relief from demand pressures following a period of restrictive monetary policy in 1966, the increase in wholesale prices slowed markedly in 1967, edging upward only 0.2 percent. Monetary restraint was eased in 1967, and with spending in both the public and private sectors expanding rapidly, the rate of price increase accelerated in 1968, setting a sharp uptrend that continued through 1969 and into 1970.

The increase in wholesale prices since 1966 has been broadly based, with rises in all segments of the economy contributing to the increase in the index. The wholesale index for farm products and processed food and feed has swung some from year to year but, on average, has increased faster than the index of wholesale prices overall. The index for industrial commodities has increased slightly less than the total wholesale price index.

Recent developments in wholesale prices provide some encouragement, however. Where prices of farm products and processed food and feed were increasing sharply in the first quarter

### **Price index for industrial materials passes peak in first quarter**

1957-59=100

SOURCE: U.S. Department of Labor.

of this year, they declined in the second. And although prices of industrial products were still increasing in the second quarter, they were not increasing quite as fast as in the first quarter. As a result, the wholesale price index increased at an annual rate of 1.7 percent in the second quarter, compared with 5.9 percent in the first quarter.

Further encouragement has come with a decline in average prices of raw industrial materials. The wholesale price index of industrial materials prepared by the Department of Labor is usually a leading indicator of price behavior. This index followed an irregular pattern through much of 1968 but moved sharply upward late in the year and, except for a temporary dip during the fourth quarter, continued to rise throughout 1969. After reaching a cyclical peak in February of this year, however, the index declined for five consecutive months, registering an annual rate of decline of 7.2 percent for the second quarter.

### *Prices at the consumer level*

Consumer prices drifted upward throughout the first half of the 1960's, but so gradually that the increase caused little concern on the part

of the public or its policy-makers. After 1965, however, these prices rose at an accelerating rate, averaging 3.8 percent a year between 1966 and 1969. Last year, the consumer price index averaged 5.4 percent higher than a year earlier. By June 1970, \$1.35 was needed to buy what a dollar would have bought in 1957-59.

Consumer prices increased faster in the first two quarters of this year than in 1969. On a monthly basis, however, the annual rate of increase moderated slightly in May, June, and July, providing some encouragement, even though it may take several months to determine whether the rate of increase in consumer prices has actually passed its peak.

After advancing at an annual rate of 9.0 percent in the first quarter, the increase in food prices slowed to 3.4 percent in the second quarter. Prices of other nondurable goods accelerated in the second quarter, but much of this

increase came in April. The rate of increase slowed again in May and June.

Prices of consumer durables did not increase as fast in the 1960's as prices of services and nondurable goods. But in the second quarter this year, prices of durable goods rose sharply, gaining at an annual rate of 7.0 percent compared with 1.4 percent in the first quarter. This increase could be only temporary, however, since much of the rise resulted from a rapid acceleration in used-car prices.

Prices of services have been increasing faster than consumer commodity prices since 1960. They were up sharply in the first half this year, advancing 9.8 percent in the first quarter and 8.8 percent in the second quarter, compared with 7.0 percent for 1969. Although the moderation in the rate of increase between the first and second quarters was slight, the percentage increase every month in the second quarter was

---

## The Two Price Indexes

The consumer price index measures changes in the prices of goods and services most often bought by urban wage earners and clerical workers, whether as single people or for their families. Since it is not feasible to obtain price quotations on everything people buy, about 400 key items have been selected to make up a "market basket" for use in determining current price levels. Items are priced periodically in different cities, mainly through personal visits to a sampling of retail and service outlets.

The wholesale price index measures changes in prices of about 2,400 commodities sold in large lots at the first level of commercial transaction. The index, therefore, refers to prices paid to producers of goods

and raw materials and not to the prices paid wholesalers, distributors, and jobbers.

A recent study suggests that the wholesale price index tends to overstate prices during periods of economic slowdown. The possibility of overstatement results from the index being based on sellers' posted prices, without incorporation of the special price concessions that are often made when business activity eases. If there is this form of upward bias present in the wholesale price index, wholesale prices may have moderated even more than indicated in this article. (See George J. Stigler and James K. Kindahl, *The Behavior of Industrial Prices*, National Bureau of Economic Research General Series, No. 90, New York, 1970.)

**AVERAGE ANNUAL RATES OF CHANGE  
IN PRICE INDEXES**

less than the smallest monthly increase in the first quarter.

***The outlook for stability***

In the face of restrained aggregate demand, fewer price increases may be attempted in the months ahead, and some of those that are tried may be rolled back in the marketplace. Because wholesale prices are usually more responsive to changes in economic conditions than consumer prices, the moderation of their increases is encouraging, especially since many of these prices represent the cost of commodity inputs to producers. Moderation of the increase in wholesale prices could help take some of the upward pressure off consumer prices.

The slowing trend in wholesale prices is apt to be irregular, however, and could take some time before leveling off. In July, for example, wholesale prices spurted upward again at an annual rate of 7.2 percent — the sharpest rise in six months. Then in August, the movement reversed itself and the index actually declined — for the first time in two years.

Although the recent downward trend in wholesale food prices raises hopes that increases in consumer food prices may moderate further, services seem the key to any substantial braking in the rate of increase in consumer prices. The rapid increase in prices of services has been pulling up the rate of increase in the consumer price index overall. If the slight moderation in the rate of increase of service prices in the second quarter continues throughout the rest of the year, the trend of the consumer price index could improve substantially.

Higher labor costs remain one of the major upward pressures on both wholesale and consumer prices. Many labor groups are demanding large wage increases in hopes not only of offsetting an expected rise in consumer prices but also of gaining in real purchasing power. Much smaller wage demands will probably come only after a sustained movement toward price stability. But even if wage rates continue to rise rapidly, a substantial increase in productivity could result in a marked slowing in the rise of unit labor costs. In fact, in manufacturing, a sharp rise in productivity in the first half slowed the rate of increase in unit labor costs.

Because these various adjustments take considerable time to diffuse throughout the economy, an inflationary spiral, once started, can be broken up only over a lengthy period and with some lag.

Although monetary and fiscal policy has eased somewhat in 1970, the battle against inflation is still far from won. The rate of increase in consumer prices, for example, could be cut in half and still be moving up much faster than in the first half of the 1960's. Some economic restraints, therefore, may be needed even after the increase in prices has definitely slowed. Otherwise, there could be a resurgence of inflationary pressures before the rate of price increase is restored to a level that can be tolerated over the long run.

LEONARD G. BOWER

# The rise in unemployment

The economic slowdown in the first half of 1970 brought unemployment to the highest level since 1965. Where the number of unemployed averaged about 2.9 million (3.6 percent of the civilian labor force) in the fourth quarter last year, the average reached almost 4 million (4.8 percent of the labor force) in the second quarter this year.

Part of the increase during the first months of the year can be attributed to an unusually sharp increase in the labor force. Between the fourth quarter last year and the first quarter this year, the labor force expanded by an addi-

tional 915,000 workers — or at an annual rate of almost 3.7 million. On the basis of changes in the working-age population and long-term trends in labor participation rates, the labor force is expected to grow approximately 1.5 million a year.

With the economy slowing and production declining, employment opportunities also began to shrink and growth in employment slowed appreciably. As a result, many new entrants into the labor force could not find work. The number of unemployed workers swelled almost 500,000 in the first quarter, with workers entering the labor force accounting for more than 40 percent of the increase.

But even in these early months of the year, many employers, faced with sluggish demand for their output and declining profits, began to trim back their work forces. More than half the increase in unemployment in the first quarter was among workers that had lost their last job, mostly through layoffs.

## Total nonfarm payroll employment falls in second quarter this year

## Impact on labor demand

As the year progressed, layoffs became the dominant factor contributing to the rising trend in joblessness. In fact, seasonally adjusted, the civilian labor force increased only 100,000 in the second quarter, and less than 1 percent of the rise in unemployment could be traced to new entrants into the labor force. Some secondary workers (women and teen-agers) that had entered the labor force during the early stages of the slowdown, when jobs were still abundant, dropped out of the labor force in the spring, discouraged by the reduction in available work. Unemployment increased by 566,000 in the second quarter, with workers that had lost their last job accounting for more than four-fifths of the increase.

The first-quarter easing in demand for workers was fairly well concentrated in industries producing durable goods, especially defense-related items and consumer durables. While nonfarm payroll employment increased 299,000 in the first quarter, the number of employees on payrolls of durable goods manufacturers decreased 189,000. About half this drop was in industries producing transportation equipment, mainly aircraft and automobiles.

Nonfarm payroll employment fell almost 260,000 in the second quarter as employment in durable goods manufacturing continued to deteriorate and weakness in demand for labor spread to other sectors of the economy. Payroll employment fell in all goods-producing industries (mining, construction, and durable and nondurable goods manufacturing), was at a virtual standstill in trade, and grew substantially slower in finance and services. Government was the only major sector with faster growth in payroll employment in the second quarter than in the first, and employment growth in this sector would have also fallen had it not been for the temporary increase in Federal employment resulting from the addition of enumerators for the 1970 census.

### Effects on the Southwest

Job opportunities were reduced nationwide, although some areas were affected more than others. Hardest hit were areas with heavy concentrations of industries producing defense items and consumer durables. Areas depending less on manufacturing were better able to maintain fairly low levels of unemployment. Unemployment rose sharply along the Pacific Coast, for example, as spending on defense and aerospace programs was reduced. But in some areas of the Midwest, where much of the employment is in nonmanufacturing, joblessness remained at comparatively low levels.

The Southwest has fared slightly better than the nation as a whole. Last December, the aver-

## Joblessness in the Southwest follows national trend this year, after initial drop

UNEMPLOYMENT AS PERCENT OF CIVILIAN LABOR FORCE

(Seasonally adjusted)

State	Unemployment as percent of civilian labor force		Increase
	June 1970	December 1969	
Arizona	4.6	2.8	1.8
Louisiana	6.4	5.2	1.2
New Mexico	6.3	4.9	1.4
Oklahoma	4.4	3.4	1.0
Texas	3.4	2.8	.6

age rate of unemployment for the five states of the Eleventh Federal Reserve District was 3.4 percent, compared with 3.5 percent for the nation. In January, while the nation's unemployment rate was rising substantially, the average rate for these five southwestern states even declined a little. Since then, the unemployment rate for the Southwest has also been on the rise, but it has remained about 0.6 percentage point less than the rate for the nation.

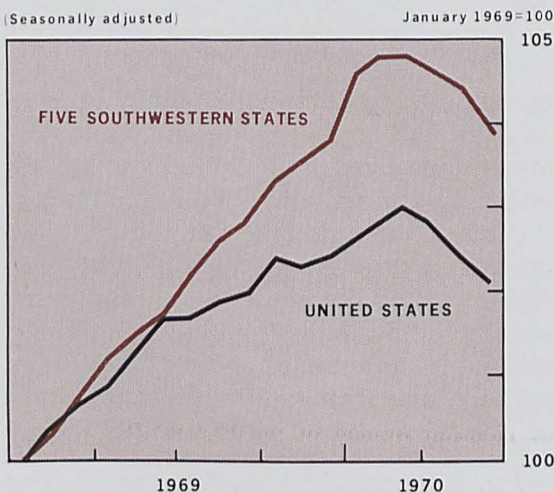

There have been wide differences within the region, however, with only Texas maintaining an unemployment rate significantly below the national average. Texas and Arizona started

the year with unemployment rates of only 2.8 percent. In the first half of the year, the rate for Texas increased about half as fast as the rate for the nation as a whole, reaching only 3.4 percent in June. The unemployment rate in Arizona increased faster than the national average, however, reaching 4.6 percent in June — a rate only 0.1 percentage point less than the rate for the nation.

The unemployment rates for Oklahoma, Louisiana, and New Mexico advanced at about the same pace as the average for the nation. Oklahoma began the year with an unemployment rate slightly below the national average and held this advantage through the first half of the year. The jobless rates for Louisiana and New Mexico, however, were already about 5 percent at the start of the year. By June, unemployment in these two states had reached more than 6 percent.

While the unemployment rate in the Southwest began moving upward in February, the weakness in labor demand was not reflected

### RECENT CHANGES IN SOUTHWESTERN NONFARM PAYROLL EMPLOYMENT

(Seasonally adjusted)

Area	Second quarter 1970 from first quarter 1970		First quarter 1970 from last quarter 1969	
	Number	Percent	Number	Percent
Arizona . . . . .	400	0.1	13,600	2.6
Louisiana . . . . .	-22,000	-2.1	11,200	1.1
New Mexico . . . . .	-3,200	-1.1	3,500	1.2
Oklahoma . . . . .	-8,200	-1.1	5,400	.7
Texas . . . . .	7,400	.2	41,600	1.1
Total . . . . .	-25,600	-4	75,300	1.2

SOURCES: State employment agencies.  
Federal Reserve Bank of Dallas.

in payroll employment until March. In fact, growth in nonfarm payroll employment in the five southwestern states showed no signs of abating all last year, even though growth nationwide had begun to slow about midyear. For a while, job markets in the Southwest seemed almost immune to the economic slowdown that was cutting employment in much of the rest of the country. In March, however, the trend in the Southwest leveled off and in the next three months moved downward, following the pattern set for the nation.

The region's recent cutback in nonagricultural employment centered in Louisiana. Of a second-quarter drop of 25,600 in nonfarm payroll employment in the five states, 22,000 was in Louisiana. Oklahoma and New Mexico also showed declines, while employment growth in Texas and Arizona showed substantial leveling.

### Outlook for the second half

While evidence continues to accumulate indicating that economic recovery may be near, demand for labor is likely to remain sluggish for a time. Typically, when economic activity begins to pick up again after a downturn, employers meet additional demand by raising the output of employees already on the payrolls and lengthening their workweek. Only when these efforts are no longer enough to provide the

manpower needed to meet the demand for output do employers usually begin adding to their work forces.

Latest indications are that this pattern of lag between general economic recovery and recovery in employment is apt to be followed in the months ahead. Nonfarm payroll employment fell again in July for the fourth month in a row, reflecting further weakness in the demand for labor. But the average workweek of nonfarm payroll employees edged upward in July for the second consecutive month, indicating that some firming in labor demand may not be far off. Moreover, the rate of layoffs in

manufacturing has declined significantly since reaching a peak in April, providing evidence that this major source of unemployment in the first half of 1970 has finally begun to subside.

Although these recent developments suggest that employment may level off in the next few months and, perhaps, begin moving back upward before the end of 1970, the nation's rate of unemployment could easily rise still further, as growth in the civilian labor force outstrips gains in employment. In July, the unemployment rate bounced back to its May level of 5 percent, after declining to 4.7 percent in June.

# Inventory adjustments

Gross national product and its two major components — final purchases and inventory investment — have shown a well-defined relationship in previous economic slowdowns, and the recent slowing is no exception. In every recession since World War II, the change in inventory investment has been far greater than the total change in final purchases by consumers, businesses, and government.

Since business holdings of goods account for most of any short-term swing in GNP, business decisions have an enormous influence on the quarter-to-quarter course of economic activity. This influence is so great, in fact, that knowledge of movements in business inventories is essential to the formation of effective monetary and fiscal policy.

There are several reasons for the volatility of business investment in inventories. Inventory investment directly involves expectations about future sales. Unlike investment in plant and equipment, which can have a significant lag between changes in expected sales and changes in investment levels, inventories can be adjusted to sales fairly quickly.

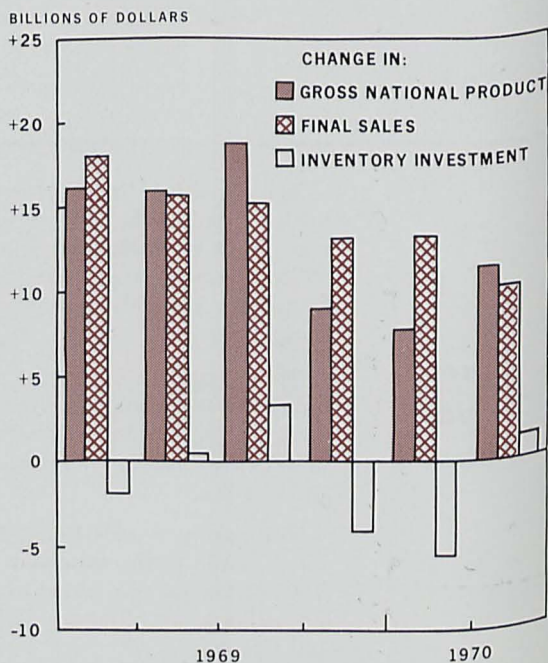

Because inventories act as a buffer between output and final sales, expectations about production also affect the level of business stocks. It is not unusual for producers of durables, for example, to stockpile goods in anticipation of labor negotiations either in their industry or in major supplier industries.

Expectations about price changes also affect inventory investment. If prices of goods appear likely to increase, businessmen will probably increase their holdings of these goods as a hedge against expected inflation. Widespread building of inventories on price speculation can increase their operating costs, especially if in-

terest rates also rise, as they ordinarily do when overall demand is strong.

Many inventories, especially of durables, are held by companies in industries highly sensitive to changes in the general economy — a fact that adds further to the volatility of inventories. Producers of business, transportation, and construction equipment, for example, operate largely in interdependence with other producers. When one producer changes its inventories, it adjusts its orders to suppliers. Each of the suppliers, in turn, also changes its inventory level to keep inventories in line with changes in sales. Thus, during a period of economic slowdown, a decision by one manufacturer to reduce inventory investment would start cut-

## Recent changes in GNP affected more by inventories than final sales

SOURCE: U.S. Department of Commerce.

backs in the rate of inventory accumulation at all levels of production.

Most of these conditions have been reflected, at least in part, in the economic slowdown of 1969-70. Investment in inventories declined from an annual rate of \$11.3 billion in the third quarter last year to \$1.6 billion in the first quarter this year. Although the decline was sharp — a drop of \$10 billion in six months — it stopped short of actual liquidation and was, in fact, the smallest adjustment in any economic downturn since World War II.

The slower growth of sales in industries producing durable goods — particularly consumer durables and defense-related items — triggered a chain of events leading to a fourth-quarter reduction in inventory investment. With sales in these industries sluggish, inventories rose relative to sales, indicating by early fall that there were trouble areas in durable goods at both manufacturing and retail levels. As production was trimmed back, inventory investment was trimmed to \$7.2 billion in the fourth quarter.

The slowdown in sales spread into still other durable goods industries in the first quarter of this year — particularly business machinery and equipment industries — leading to slower accumulation of inventories in those industries. Inventory investment was cut back to \$1.6 billion in the first quarter — a decline of \$5.6 billion from its level in the fourth quarter last year. The spillover of inventory adjustment into 1970 resulted mainly from the continued sluggish growth in sales, but with credit still scarce and interest rates rising, financial markets also discouraged increases in inventories.

Business accumulation of inventories rose to an annual rate of \$2.9 billion in the second quarter this year, reversing the downward trend in the rate of accumulation that had held for the previous two quarters. All the improvement in real GNP in the second quarter can be

## Inventory-to-sales ratios improve, but still higher than a year earlier

June 1970 preliminary.  
SOURCE: U.S. Department of Commerce.

attributed to increased inventories. Final purchases rose only \$10.3 billion — the smallest quarter-to-quarter gain in over three years.

While the \$1.3 billion gain in inventories in the second quarter represented a turnaround in the downward adjustment of the previous two quarters, many observers do not expect a resurgence in inventory investment in the second half of the year. Sales may not have improved enough for any further buildup in stocks. Although inventory-to-sales ratios had improved at midyear, ratios for durable goods remained high at both manufacturing and retail levels.

CHARLES M. WILSON

## *District highlights*

Total nonagricultural wage and salary employment in states of the Eleventh District continued to show weakness in July, even though employment dropped less than seasonally expected. Gains over a year before were only moderate. The soft demand for labor was also seen in rising unemployment rates over the District and in high levels of unemployment claims. Most of the softness was in manufacturing and construction, the industries most affected by the current economic slowdown.

Nonfarm payroll employment in the five southwestern states declined 0.4 percent in July, to a total of 6,365,200 workers. The change resulted from declines in manufacturing, construction, and government payrolls. Almost all other categories of employment increased moderately. The only exception was finance, which held steady.

Compared with a year before, strength was generally lacking. An increase in total employment of 1.6 percent over July 1969 reflected a decline of 3.1 percent in manufacturing and a rise of 2.7 percent in nonmanufacturing. Within nonmanufacturing, absolute declines from a year earlier were registered only in mining and construction.

Department store sales in the Eleventh District were 7 percent higher in the four weeks ended August 22 than in the corresponding period last year. Cumulative sales through that date were 3 percent higher than a year earlier.

Registrations of new passenger automobiles in Dallas, Fort Worth, Houston, and San Antonio were slightly higher in July than in June. Changes ranged from an increase of 13 percent in Houston to a decrease of 14 percent in Dallas. Although total registrations were 12 percent

higher than in July 1969, cumulative registrations through July trailed registrations for the same period last year by 6 percent.

Industrial production in Texas was unusually weak in July. The seasonally adjusted Texas industrial production index declined 1.8 percent to 174.0 percent of its 1957-59 base. The decline was more widespread than in other recent months. Of the three major industrial categories, only utilities held steady. Where weakness had previously centered in the manufacturing of durable goods, it spread to mining and the manufacture of nondurable goods in July.

Mining output was down 1.9 percent from June but was still 2.1 percent higher than a year before. With the oil allowable in Texas lower in recent months, this weakness was expected. The allowable was raised to a record high in August, however, and since crude oil accounts for nearly 30 percent of the Texas index, industrial production was expected to show more strength in August.

Manufacturing output declined in July — for the fourth time in six months. In the production of durables, the most pronounced drop was in electrical machinery. Transportation equipment rose slightly, reflecting recent strength in automobile production before retooling for new models. The weakness in nondurables, although moderate, covered most products. Only leather and leather products showed any real strength.

Compared with a year ago, the state's manufacturing output was off 1.5 percent. A year-to-year increase of 4.8 percent in the production of nondurables was more than offset by a decline of 9.3 percent in durables. The largest year-to-year decline in durable goods was also in the

manufacture of electrical machinery. Transportation equipment was off 8.6 percent. Except for textile products, all categories of non-durable goods were up from July last year.

---

Cotton, corn, sorghum, and other unharvested crops in the Coastal Bend area of Texas were severely damaged by Hurricane Celia — although not as severely as first expected. The loss has been estimated at \$8 million, and damage to agricultural buildings, equipment, and land is believed to be even higher. Several gins in the path of the storm were either totally destroyed or so heavily damaged that operations cannot be undertaken this harvest season.

Despite the hurricane damage and general lack of rain, most crops in the states of the Eleventh District are making fair progress. Based on conditions August 1, cotton production in the five southwestern states was expected to total slightly more than 5.2 million bales, or 18 percent more than in 1969. The expected increase results from both larger planted acreage and prospects for higher yields. In Texas, the forecast was 28 percent more than the 2.9 million bales produced in 1969. The yield in Texas was expected to average 348 pounds of lint per acre, compared with 292 pounds in 1969. Even this, however, would be less than the 410-pound average in 1968.

Production of grain sorghum in the southwestern states was expected to total 385 million bushels, or 4 percent more than last year. Rice production was expected to be down about 2 percent from a year before.

Most livestock were in fair to good condition on August 1. The number of cattle on feed in Texas totaled 1,388,000 head, or 10 percent more than a year before. There were 412,000 head of cattle on feed in Arizona, or 8 percent fewer than a year before.

Of the 267 feedlots in Texas with capacities for at least 1,000 head, 184 reported cattle on

feed July 1. This is an occupancy rate of 58 percent, compared with 73 percent a year before and 54 percent two years before.

The nation's six largest cattle feeding states had 6,430,000 head on feed August 1 — 4 percent more than a year earlier. States showing increases, in addition to Texas, were Colorado (31 percent), Nebraska (9 percent), and Iowa (3 percent). Gains in these four states more than offset declines in California (15 percent) and Arizona.

Prices received by Texas farmers and ranchers were fractionally lower on July 15 than a year earlier. The all-crops price index was 1 percent higher than in July 1969, but the price index for livestock and livestock products was 1 percent less.

Cash receipts from farm marketings in states of the District in the first half of this year were up 1 percent from the same period last year. Receipts from sales of livestock and livestock products were up 8 percent, but receipts from crop marketings were down 14 percent.

---

Restrictions on oil production in Libya and disruption of the Trans-Arabian Pipeline through Syria have forced oil companies to move more European petroleum imports around Africa by tanker. The resulting increase in demand for tankers has raised shipping rates, pushing up the price of petroleum imports to Europe and the United States and threatening shortages on both sides of the Atlantic.

In response, crude oil production in states of the Eleventh District has been increased sharply. Louisiana increased its August rate from 51 percent of maximum efficient production to 56 percent and then, for September, raised the rate to a new record of 66 percent.

In Texas, the Railroad Commission, meeting in emergency session, raised the August allowable from 62.9 percent of maximum efficient

production to a record 70 percent and made the increase retroactive to August 1. For September, the commission increased the allowable to 79.9 percent.

The commission has expressed concern, however, that conservation problems, such as unwanted production of associated gas and hard-to-dispose-of salt water, might develop at this high production rate. Pipeline capacity could also become a problem. Problems with the conservation of gas prevented New Mexico from increasing its production rates above the level for August.

Sulfur production in the District is suffering from low world prices. By-product sulfur from desulfurization of fuels and increased mining capacity abroad have driven sulfur prices down, causing some production in the District to be shut down.

---

Total loans and investments at weekly reporting commercial banks in the Eleventh District declined considerably in July and the first two statement weeks in August. With demand for most types of loans remaining sluggish and deposits increasing, these banks added slightly to their security holdings.

Total loans declined \$78 million. Business loans declined \$44 million, which was in sharp contrast to an increase of \$63 million a year earlier. Loans to financial institutions other than banks declined \$29 million as it became somewhat easier for finance companies to obtain funds in the commercial paper market. Consumer instalment loans were essentially unchanged. Real estate loans rose \$17 million.

Bank holdings of securities had increased \$2 million since midyear. The banks increased their holdings of municipals and, with two Treasury financings in July, added to their holdings of Treasury bills. Increases in holdings of these securities more than offset reductions in intermediate- and long-term U.S. Government notes and bonds.

Total deposits rose \$72 million in July and early August, despite a \$183 million decline in demand deposits — most of which were held by individuals, businesses, and the U.S. Government. A sharp increase of \$255 million in time and savings deposits stemmed mainly from sales of large certificates of deposit following the recent suspension of Regulation Q ceilings on short-term CD's. With this increase in deposits, the banks further reduced their outstanding borrowings from nondeposit sources.
