

## Capital Controls by Any Other Name

Financial globalization over the past 40 years has been driven in part by the idea that what is optimal for international trade in goods—the absence of regulation—is optimal for international trade in assets in the form of free capital flows. Since the recent financial crisis, however, many emerging markets have responded to large inflows of investment by imposing controls on them.<sup>1</sup> The financial press has claimed that the International Monetary Fund (IMF), previously a strong advocate of complete capital account liberalization (i.e., uninhibited international capital flows), has reversed its position by supporting such controls and even detailing a policy framework for their use (Talley and Reddy, 2011).<sup>2</sup> To the contrary, the IMF's proposal retains the fundamental doctrine of free capital flows without addressing the most important question: Is free trade in dollars really no different from free trade in widgets?

Advocates of free capital flows argue that they promote efficient resource allocation: Global savings flows to its most productive uses, maximizing economic growth. Critics argue that the herding tendency of investors creates large, highly disruptive booms and busts in the domestic credit of individual countries, compromising their monetary policy independence. The Asian financial crisis of 1997-98, for example, is commonly attributed to herding behavior: Unprecedented large inflows of capital to Indonesia, Malaysia, Korea, Thailand, and the Philippines in 1996 suddenly reversed in 1997, with \$12 billion flowing out of these countries.

After the Asian financial crisis, many economists asked whether capital crises could ever be eliminated in a world of free capital flows (e.g., Rodrik, 1998). The response of the IMF was “[We] recognize that without both sound macroeconomic policies...and strong, transparent, and properly supervised banks...opening up capital flows is dangerous and inadvisable. The opening-up must occur in the proper sequence; this is the moral of the Asian story” (Anjaria, 1998).

In the wake of the recent financial crisis, the IMF's proposed policy framework for capital controls only reiterates this lesson learned: Controls are defined as a last-resort policy tool to handle transitory capital inflows when exchange rate appreciation is against fundamentals, foreign exchange buildups are inadvisable, and reforming the financial system would take too long (IMF, 2011). The implication remains that a properly regulated and supervised banking system can fully mitigate any risks posed by free capital movements: Capital controls represent a temporary stopgap when the “proper sequencing” fails. The counterargument remains that no amount of domestic banking regulation can prevent the capital crises inherent to unfettered capital flows.

One commonly cited factor in capital crises is that countries borrow too much during good times (Magud and Reinhart, 2007). For example, Korea was again subject to large outflows in 2008 following the collapse of Lehman Brothers. After this episode, Korea introduced and strengthened limits on the buildup of short-term

external debt in its banking system that had facilitated the abrupt reversals of capital flows in 1997 and 2008. For its part, the IMF labeled Korea's reaction “macroprudential” and targeted at financial stability risks, which the new IMF guideline on capital controls permits “at any time...provided they are not assessed to have been designed to influence inflows” (IMF, 2011). But clearly the measures are both designed to address systemic risk and targeted at capital inflows.

The embrace of ad hoc capital controls to address temporary market inefficiencies on a case-by-case basis, while pragmatic, perpetuates the view that each capital crisis is an isolated example of failed financial institutions. The question that should be debated is whether a strict distinction between macroprudential measures and measures targeted at international capital movements is justified. Surely free capital flows, like free trade in goods, carry large benefits. Yet the proposition that trade in dollars carries no more risk than trade in goods remains controversial. If regulating internal debt accumulation is important for limiting systemic risks, then regulating external debt accumulation should be similarly important. Moreover, measures targeted at specific capital flows, such as short-term external debt, do not exclude the benefits of capital flows in the form of foreign direct investment and other equity flows.

—Brett Fawley and Luciana Juvenal

## Conventions used in this publication:

1. Charts and tables contain data that were current through July 2011. Unless otherwise indicated, data are quarterly.
2. The *percent change* refers to the percent change from the same period in the previous year. For example, the percent change in  $x$  between quarter  $t-4$  and the current quarter  $t$  is:  $[(x_t/x_{t-4})-1] \times 100$ .
3. All data with significant seasonal patterns are adjusted accordingly.

Dear Reader,

To serve you better, we have expanded *International Economic Trends* to include data on six important emerging markets: Brazil, China, India, Korea, Mexico, and Russia.

We welcome your comments addressed to:

## Notes

**Euro-Area Data:** Euro-area countries are Austria, Belgium, Cyprus, Estonia, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Malta, the Netherlands, Portugal, Slovenia, Slovakia, and Spain. Data series are break adjusted and include all euro area countries for the full sample, with these exceptions: Series for interest rates are not break adjusted.

Euro-area interest rates prior to December 1998 are calculated on the basis of national government yields weighted by GDP. Starting in 1999, short-term rates are euro interbank offered rates. Long-term rates are calculated on the basis of national government bond yields weighted by the nominal outstanding amounts of government bonds in each maturity band.

The euro/dollar exchange rate used in the chart on page 14 is a synthetic rate prior to January 1999. This is constructed by calculating a weighted average of the exchange rates of the euro-area countries, excluding Greece and Luxembourg, against the dollar. The weights are based on 1997 GDP shares.

**German Data:** As a result of reunification, data for all of Germany are now incorporated in the statistical series. The starting periods for unified German data are listed below. Care should be exercised when interpreting the data around these break periods.

First quarter 1995: hourly earnings.

**Capacity Utilization** covers the manufacturing sector for Canada, China, France, Japan, Korea, Mexico, Russia, the United Kingdom, the United States, and the euro area; manufacturing excluding food, beverage, and tobacco for Germany; mining and manufacturing for Italy; installed capacity utilization for Brazil.

**Consumer Price Index** is for all items. The current index is based on goods and services consumed by all individuals for Brazil, Canada, India, Mexico, and Russia; all multi-person households excluding those mainly engaged in agriculture, forestry, and fisheries for Japan; all households except pensioners dependent on state pension and high income households for the United Kingdom; all households except farming and fishing for Korea; all urban households for the United States; all urban and rural residents for China. Data for the euro area, France, Germany, and Italy are based on the harmonized index of consumer prices.

**Current Account Balance** is the sum of merchandise and service exports and income receipts on domestic assets abroad minus the sum of merchandise and service imports and income payments from foreign assets in the domestic economy plus net unilateral transfers.

**Earnings** are based on hourly earnings in manufacturing for Canada, Germany, the United States, and the euro area; hourly earnings in manufacturing excluding construction for France, hourly earnings in industry for Italy; hourly earnings for Mexico; monthly earnings in manufacturing for Brazil, China, Japan, and Russia; monthly earnings for wage earners in manufacturing for Korea, and weekly earnings in manufacturing for the United Kingdom.

German real earnings data prior to 2007 are not strictly comparable with the new figures: Before 2007, gross hourly earnings covered full-time wage earners only. Since the first quarter of 2007, the data refer to the index of gross hourly earnings (excluding extra payments) of full-time wage earners and salaried employees.

The **Exchange Rate** for all countries except the United States is expressed as units of local currency per U.S. dollar. For the United States the trade-weighted exchange rate, **TWEX**, is used. This is a weighted average of the exchange value of the U.S. dollar relative to the major international currencies—the euro, Canadian dollar, Japanese yen, British pound, Swiss franc, Australian dollar, and Swedish kronor. Prior to 1999, the currencies of the euro-area countries (with the exception of Greece) are used instead of the euro.

**Real Effective Exchange Rate** uses normalized unit labor costs in manufacturing. The weighting scheme used to construct the rates, for all except the euro area, is based on disaggregated data for trade among 21 industrial countries in manufactured goods for 2005. For the euro area the weights relate to the trade of the euro area with the other countries. The weights reflect the relative importance of a country's trading partners in its direct bilateral trade relations and competition in third markets. Normalized unit labor costs in manufacturing are calculated by dividing an index of actual hourly compensation per worker by a five-year moving average index of output per man-hour.

**Employment** data refer to civilian employment for Canada, Germany, Italy, Japan, Korea, Russia, and the United States; industrial employment for France; and total employment for Brazil, the euro area, Mexico, and the United Kingdom.

**Foreign Exchange Reserve** data are end of period. The dollar value of reserves may fluctuate as a result of changes in reserve holdings and/or changes in the value of the currencies held vis-à-vis the U.S. dollar.

**Government Budget Balance** is the difference between general government current receipts and total outlays. Total outlays consist of current expenditures and net capital expenditures. **Gross Government Debt** incorporates all financial liabilities of the general government sector. The general government sector consolidates the accounts of the central, state, local, and social security sectors. For China and India general government gross debt consists of all liabilities that require payment or payments of interest and/or principal by the debtor to the creditor at a date or dates in the future. This includes debt liabilities in the form of SDRs, currency and deposits, debt securities, loans, insurance, pensions and standardized guarantee schemes, and other accounts payable.

**Cumulative Inflation Differential** is the cumulative change in the foreign consumer price index (CPI) over the change in the U.S. CPI, in percentage terms. The base period for the cumulative rate of change is taken to be the first period of the chart. For example, if the base period is 2002:Q1, then the cumulative inflation differential for Japan for 2006:Q3 is as follows:

$$\text{inflation differential} = 100 \cdot \left( \frac{P_{2006Q3}^J / P_{2002Q1}^J}{P_{2006Q3}^{US} / P_{2002Q1}^{US}} - 1 \right)$$

where  $P_{2006Q3}^J$  is the Japanese CPI in the third quarter of 2006. For the U.S. chart on page 41, foreign CPI is calculated as the weighted average of the CPIs of countries whose currencies are used in the major currency trade-weighted exchange rate index. Starting in 1999, the euro-area harmonized consumer price index is used for the euro area. Prior to 1999, the price levels for the individual euro area countries (excluding Greece and Luxembourg) are used. The cumulative inflation differential is shown because the theory of purchasing power parity states that exchange rate changes should be systematically positively related to this variable.

**Industrial Production** measures the change in the volume of output in the mining, manufacturing, oil, electricity, gas, and water industries.

The **Short-Term Interest Rate** table on page 6 uses the relevant 3-month interest rate shown in the country pages.

The **Long-Term Interest Rate** table on page 6 uses the government bond rate. The government bond rate is a composite of yields on federal government bonds with maturities of more than 10 years Mexico and the United States; 10-year benchmark bonds for France; 7- to 15-year public sector bonds for Germany; 15- to 20-year government bonds through 1990 and 10-year government bonds starting in 1991 for Italy; and 10-year government bonds for Canada, the euro area, Japan, Korea, Russia, and the United Kingdom.

The **Reserve Money** table on page 5 refers to the adjusted monetary base for Japan and the United States; monetary base for Brazil, Canada, Mexico, Russia; and M0 for the United Kingdom. **Reserve Money** is currency in circulation, deposits of the deposit money banks, and demand deposits of other residents (with the exception of the central government) with the monetary authority.

### Adjusted Monetary Base

Japan: currency in circulation and current deposits at the Bank of Japan.

United States: the sum of currency in circulation outside Federal Reserve banks and the U.S. Treasury, deposits of depository financial institutions at Federal Reserve banks, and an adjustment for the effects of changes in statutory reserve requirements on the quantity of base money held by depositories.

### Notes and Coins in Circulation

United Kingdom: After reforming the rules governing bank reserves, the Bank of England discontinued its M0 series in May 2006 because the data would not be comparable to previous data. *IET* now presents a related series, "Notes and Coins in Circulation," in place of M0. The Bank of England

directs interested parties to “Publication of narrow money data: the implication of money market reform” in its Autumn 2005 *Quarterly Bulletin* (<http://www.bankofengland.co.uk/publications/quarterlybulletin/qb050304.pdf>).

**M1**

Japan: cash, currency in circulation, and deposit money.  
Euro area: currency in circulation and overnight deposits.  
Brazil: notes and coins held by public, and demand deposits.  
China: currency in circulation, and demand deposits.  
India: currency in circulation and demand deposits at monetary institutions.  
Korea: currency in circulation and demand deposits at monetary institutions.  
Mexico: notes, coins, cheque accounts held by public, denominated in Pesos or in foreign currency, and interest accounts in Pesos.  
Russia: money outside bank and demand deposits in the banking system.

**M1B**

Canada: currency outside banks, chartered bank checkable deposits, less inter-bank checkable deposits.

**MZM**

United States: currency in circulation, travelers’ checks, total publicly-held checkable deposits minus cash items in the process of collection and Federal Reserve float, savings deposits, shares in retail money market mutual funds (funds with initial investments of less than \$50,000), net of retirement accounts, and institutional money market mutual funds.

**M2**

Canada: currency outside banks, chartered bank demand and notice deposits, chartered bank personal term deposits, adjustments to M2 (continuity adjustments and inter-bank demand and notice deposits).  
United Kingdom: currency in circulation and sterling retail deposits with the U.K. banks and building societies.  
United States: MZM less institutional money market mutual funds plus small denomination (less than \$100,000) time deposits.  
Brazil: M1 plus open market funds, short-term fixed-yield funds, short-term financial investment funds, remunerated special deposits and bonds of the federal government, states, and municipalities, held by the non-financial public entities.  
China: M1 plus quasi-money (time deposits and savings deposits and other deposits).  
Korea: M1 plus time and savings deposits and residents’ deposits in foreign currency at deposit money banks.  
Russia: M1 plus quasi-money (bank system deposits that cannot be directly used for making payments and are less liquid than M1). This includes time deposits in national currency and all deposits in foreign currency.

**M2 + CDs**

Japan: M1 plus private deposits, public deposits less demand deposits, and certificates of deposit.

**M3**

Euro area: M1 plus deposits with a maturity up to 2 years, deposits redeemable at notice up to 3 months, repurchase agreements, money market funds, and debt securities up to 2 years.  
India: M1 plus post office savings, bank deposits and residents’ deposits in foreign currency at deposit money banks, and other time deposits with banks.  
Mexico: M1 plus residents’ possessions of other bank deposits, securities issued by the Federal Government, securities issued by private entities and the retirement saving funds, plus bank deposits and Federal Government securities in the hand of non-residents.

**M4**

United Kingdom: M2 plus wholesale deposits with the U.K. banks and building societies.

**Output Per Worker** is the ratio of real GDP to employment.

**Producer Price Index** covers manufacturing for Canada and the United Kingdom; and total industry for Japan and the United States. Data for the euro area, France, Germany, and Italy are based on the harmonized index of total industry excluding construction.

**Retail Sales** are based on a volume index.

**Stock Exchange Index** refers to all share prices except for the United Kingdom, which excludes financial firms.

**Unemployment Rate** is the standardized unemployment rate. It is the percentage of the civilian labor force that is unemployed. The unemployed are all persons of working age who are without work, readily available for work, and actively seeking work. The standardized rate may differ from the national unemployment rate calculations.
