

Long Expansions

This month, the current economic expansion enters its seventh year. That means that the U.S. economy has produced positive growth in the real value of goods and services more or less continuously since 1991. Some analysts have noted that the current expansion is mature by the standards of postwar U.S. economic history, and that one might reasonably expect a recession in the not-too-distant future. Is this true? Can we safely say anything about expansions based solely on the fact that they have been continuing for some length of time? A look at the data suggests that the answer is—probably not.

The chart gives us a way to compare economic expansions since 1960. The data are the real value of gross domestic product (GDP), quarterly, since 1960, measured as a chain-weighted quantity index and scaled so that beginning-of-expansion output is equal to one. The scaling means that we can interpret the middle- or end-of-expansion level of GDP as a multiple

of the beginning-of-expansion level of GDP. The end of an expansion is the last quarter before the onset of a recession, as defined by conventional NBER dating. The next expansion then begins with the level of output in the last quarter of the recession. The numbers indicate the length of the expansion expressed in quarters.

The chart shows that expansions sometimes take a long time to unfold, and there have not been enough of them to make any sturdy inferences about what the typical length might be. Although the current

expansion appears to be somewhere in the middle in terms of length, there is no evidence to suggest that the 34-quarter expansion in the 1960s represents some kind of upper limit on how long an expansion can continue.

It is also clear from the chart that the relative level of output so far in the current expansion is far below the relative level of output at similar points in the two longest expansions. If it were the 1960s all over again, the economy would now be producing about 1.38 times its beginning-of-expansion output. This suggests that the current expansion may have a long way to go based on the possible peak in real GDP. The 1960s, however, were witness to an influx of women into the labor force and high levels of productivity growth—influences that have tapered off in the 1990s. In part because of such trends, some economists think the growth rate of potential GDP has slowed over the postwar era, so that a long expansion today might produce slower growth, on average, than earlier expansions.

Conventions used in this publication:

- 1. Charts and tables contain data that was current on April 1, 1997.
- 2. Shaded areas indicate recessions, as determined by the National Bureau of Economic Research.
- 3. Percent change refers to simple percent changes. Percent change from year ago refers to the percent change from the same month or quarter in the previous year. The percent change at annual rate shows what the growth rate would be over an entire year if the same simple percent change continued for four quarters or twelve months. The percent change at annual rate of X between the previous quarter t-1 and the current quarter t is:

$$100 \times \left[\left(\frac{X_t}{X_{t-1}} \right)^4 - 1 \right]$$

For monthly data replace 4 with 12.

All data with significant seasonal patterns are seasonally adjusted, unless labeled NSA.

National Economic Trends is published monthly by the Research Division of the Federal Reserve Bank of St. Louis. For more information on data, please call (314) 444-8573. Single-copy subscriptions are available free of charge by writing to the Public Affairs Office, Federal Reserve Bank of St. Louis, Post Office Box 442, St. Louis, MO 63166-0442 or by calling (314) 444-8808 or (314) 444-8809. Notes

Pages 4, 5: Final sales is gross domestic product (GDP) minus change in business inventories. Advance, preliminary, and final GDP growth rates are released during the first, second, and third months of the following quarter. Changes result from incorporation of more complete information. The Purchasing Managers' Index is a weighted average of diffusion indexes for new orders, production, supplier deliveries, inventories, and employment. The National Association of Purchasing Management (NAPM) surveys over 300 firms in 20 manufacturing industries, weighting responses by industry share of GDP. Aggregate and average weekly hours are paid hours of production and nonsupervisory employees. The inventory-sales ratio uses nominal (current-dollar) inventory and sales data.

Page 6: The contribution of a component X_i to the overall GDP growth rate in quarter t is $100 \times [(1 + (X_t - X_{t-1})/GDP_{t-1})^4 - 1]$. The sign is changed for imports. This calculation forces components to add up to the GDP growth rate before compounding and does not exactly match Survey of Current Business, Table 8.2. The residual line is calculated using the finest level of detail in the table.

Page 7: Ten-year Treasury yields are adjusted to constant maturity. Three-month yields are secondary market averages, but all rates used in the yield curves are adjusted to constant maturity. The total return on the Standard and Poor's 500 is dividends as a percent of the value of the index plus the percent change in the index.

Pages 8,9: Oil prices are monthly averages of daily spot prices for West Texas intermediate crude (Wall Street Journal). Consumer price index is for all urban consumers. The consumption chain price index is the index associated with the personal consumption expenditures component of GDP. The Employment Cost Index (ECI) covers nonfarm, nonfederal employers. ECI compensation refers to a fixed sample of jobs, while compensation per hour covers all workers in the nonfarm business sector in a given quarter. In both cases, compensation is wages and salaries plus benefits.

Pages 10,11: Nonfarm payroll employment is counted in a survey of about 390,000 establishments (Current Employment Survey). It excludes self-employed individuals and workers in private households, but double-counts individuals with more than one job. The household survey (Current Population Survey) of about 50,000 households provides estimates of civilian employment, unemployment rate, labor force participation rate, and employment-population ratio. Population is civilian, noninstitutional, 16 years and over. New population controls introduced in January 1997 affect levels and growth rates of household survey employment, labor force and population. The unemployment rate and other ratios are minimally affected. 90 percent confidence intervals for the unemployment rate (± 0.2 percentage points) and change in household survey employment (± 376,000) measure uncertainty due to sample size. The household survey was changed in January 1994, so care should be exercised in making short-term comparisons around this date, particularly with the duration data shown on page 10. Other changes in the survey are detailed in Bureau of Labor Statistics, Employment and Earnings, Appendix A.

Pages 12, 13: Debt service is an estimate of scheduled interest and principal payments on outstanding debt. The Michigan consumer sentiment index shows changes in a summary measure of consumers' answers to five questions about their current and expected financial situation, expectations about future economic conditions, and attitudes about making large purchases. The survey is based on a representative sample of U.S. households.

Pages 14, 15: Overall gross saving includes government saving, which is the sum of the government surplus and capital consumption (see notes for pages 16 and 17). Net foreign investment (NFI) is U.S. investment abroad minus foreign investment in the U.S. Aside from a statistical discrepancy, NFI also equals the difference between gross domestic investment and saving.

Pages 16, 17: Government consumption and investment is current expenditures on goods and services, including capital consumption (depreciation) and gross investment, as reported in the National Income and Product Accounts (NIPA). The unified federal budget deficit differs from NIPA basis in four main ways: (1) NIPA excludes transactions involving existing assets; (2) NIPA outlays exclude government investment and include consumption of government capital, while unified budget outlays do the reverse; (3) NIPA accounts exclude Puerto Rico and U.S. territories; and (4) various timing issues are handled differently. Outlays and receipts on these pages are from the NIPAs, except as noted. Since 1977, the federal fiscal year starts on October 1. Federal debt held by the public includes holdings of the Federal Reserve System and excludes holdings of the social security and other federal trust funds. Federal grants in aid to state and local governments appear in both state and local receipts and federal outlays.

Pages 18, 19: The trade balance (shown on a balance of payments basis) is the difference between exports and imports of goods (merchandise) and services. It is nearly identical in concept to the net exports component of GDP, but differs slightly in accounting details. The investment income balance equals income received from U.S.owned assets in other countries minus income paid on foreign-owned assets in the U.S. The investment income balance is nearly identical in concept to the difference between gross national product and gross domestic product, but differs in accounting details. The current account balance is the trade balance plus the balance on investment income plus net unilateral transfers to the U.S. from other countries.

Pages 20, 21: Output per hour (Y/H), unit labor cost (C/Y), and compensation per hour (C/H) are indexes which approximately obey the following relationship: %(Y/H) + %(C/Y) = %(C/H) with %()meaning percent changes. Unit labor cost is shown on page 9. Real compensation per hour uses the CPI to adjust for the effects of inflation. Total factor productivity estimates changes in output that do not correspond to changes in quantities of labor, capital, or intermediate inputs. Inventory valuation adjustments (IVA) remove the effect of changes in the value of existing inventories from corporate profits and proprietors' income. (This change in value does not correspond to current production and therefore is not part of GDP). Capital consumption adjustments (CCAdj) increase profits and proprietors' income by the difference between estimates of economic depreciation and depreciation allowed by the tax code. Components of national income not shown are rental income of persons and net interest.
