The Gender Wage Gap

he wage differential between male and female workers has declined significantly over the past 30 years. For example, in 1979 the median weekly earnings of full-time female workers were only 63.5 percent of those of full-time male workers—a 36.5 percent difference. This earnings gap dropped to 30 percent in 1989 and 23.7 percent in 1999. As of 2011:Q1, it reached a historical low of 17.2 percent. Despite this trend, studies suggest that actual gender wage disparity (which compares wages of male and female workers with similar labor-force characteristics) is smaller than the raw gender earnings gap discussed above.

One recent study found that women's progress in educational attainment during the 1970s and 1980s was the main explanation for the decline in the gender wage gap in the 1980s and early 1990s. In addition, women's gains in work experience accounted for one-third of the gap's decline in the 1990s. As women become more educated, they have more employment opportunities in occupations that require higher skills and pay higher wages. Such occupational "upgrades" have helped to narrow the wage gap, but there are still significantly fewer women in highly paid occupations in law, medicine, and business management.

Another important reason for the gender wage gap is the difference between men and women in labor-force attachment. Women are likely to leave a career temporarily for childbirth and raising children. Such leaves may be associated with a decrease in their human capital and temporary delays in training

and promotion, which consequently lead to lower wages. In addition, women are more likely to work part-time and less likely to work overtime than men, which negatively affects their wages. Evidence suggests that female workers receive more family-friendly benefits but usually at the cost of lower wages.³ Similarly, women of childbearing age may prefer lower-wage jobs with employer-provided health insurance to higher-wage jobs without health insurance.

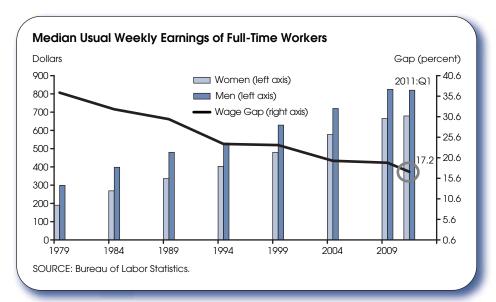

A recent report prepared for the U.S. Department of Labor thoroughly analyzed the gender wage gap using Current Population Survey data for 2007.⁴ The report estimated the gap accounting for differences between male and female workers in educational attainment, work experience, occupa-

tion, career interruption, part-time status, and overtime hours worked. The result was striking—these factors explain approximately three-fourths of the 20.4 percent raw gender wage gap in 2007. The adjusted 2007 gender wage gap is roughly 5 percent. It is reasonable to believe, therefore, that the actual 2011:Q1 gender earnings disparity is likely to be closer to 4 to 5 percent rather than the 17.2 percent shown in the chart (gray circle).⁵

Current research suggests that gender earnings disparity has declined but not disappeared. The adjusted ("true") gender wage gap, however, is substantially smaller than the raw gender wage gap. Because of this, the raw gender gap is the improper indicator for policymakers to use to justify corrective actions.

-Natalia A. Kolesnikova and Yang Liu

⁵ Put differently, the "real" gender wage gap in average weekly earnings is about \$35.

Notes

Pages 4, 5: Final Sales is gross domestic product (GDP) minus change in private inventories. Advance, Second, and Third GDP Growth Rates are released during the first, second, and third months of the following quarter. Changes result from incorporation of more complete information. Real GDP is measured in 2005 dollars. The ISM (formerly Purchasing Managers') Index is a weighted average of diffusion indexes for new orders, production, supplier deliveries, inventories, and employment. Aggregate and Average Weekly Hours are paid hours of production and nonsupervisory employees. The Inventory-Sales Ratio uses nominal (current-dollar) inventory and sales data.

Page 6: For information on how to calculate the **Contribution** of a component to the overall GDP growth rate, see the October 1999 issue of the Survey of Current Business, p. 16. The sign is changed for **Imports**.

Page 7: Ten-year **Treasury Yields** are adjusted to constant maturity; three-month yields are secondary market averages. All rates used in the yield curves are adjusted to constant maturity. **Standard and Poor's 500 Index with Reinvested Dividends** shows the total return: capital gains plus dividends.

Pages 8, 9: Oil (West Texas intermediate) and Natural Gas (Henry Hub) spot and futures prices are listed in the Wall Street Journal. Spot prices are monthly averages of daily prices; futures prices are usually taken from the last trading day of the month. Consumer Price Index is for all urban consumers. The Consumption Chain Price Index is the index associated with the personal consumption expenditures component of GDP. The Employment Cost Index (ECI) covers private nonfarm employers. ECI Compensation refers to a fixed sample of jobs, while Compensation per Hour covers all workers in the nonfarm business sector in a given quarter. In both cases, compensation is wages and salaries plus benefits.

Pages 10, 11: Effective with the January 2008 Employment Situation, the establishment survey data for employment, hours, and earnings have been converted from the 2002 NAICS system to the 2007 NAICS system. For more information see http://www.bls.gov/ces/. Nonfarm Payroll Employment is counted in a survey of about 400,000 establishments (Current Employment Statistics). It excludes self-employed individuals and workers in private households, but double-counts individuals with more than one job. The Household Survey (Current Population Survey) of about 60,000 households provides estimates of civilian employment, unemployment rate, labor force participation rate, and employment-population ratio. Population is civilian, noninstitutional, 16 years and over. The 90 percent confidence intervals for the unemployment rate (± 0.2 percentage points) and change in household survey employment (± 430,000) measure uncertainty due to sample size. Because the household survey was changed in January 1994, data prior to this date are not strictly comparable. The Bureau of Labor Statistics announced several revisions to the Household Survey on Feb. 7, 2003, with the release of the January 2003 data. For more information, see <www.bls.gov/cps/>. The Job Openings rate is the number of job openings on the last business day of the month as a percent of total employment plus job openings.

Page 13: The Michigan Consumer Sentiment Index shows changes in a summary measure of consumers' answers to five questions about their current and expected financial situation, expectations about future economic conditions, and attitudes about making large purchases. The survey is based on a representative sample of U.S. households.

Page 15: Gross Private Saving is the sum of personal saving, undistributed corporate profits with IVA and CCAdj (see notes for pp. 18-19), and private wage accruals less disbursements. Gross Government Saving is net government saving (surplus/deficit) plus consumption of fixed capital. Balance on Current Account (NIPA) is net capital transfer payments to the rest of the world plus net lending or net borrowing (international trade and income flows).

Pages 16, 17: Government Consumption and Investment is current expenditures on goods and services, including capital consumption (depreciation) and gross investment, as reported in the NIPAs. The Unified Federal Budget Surplus/Deficit differs from NIPA Basis in four main ways: (1) NIPA excludes transactions involving existing assets; (2) NIPA outlays exclude government

investment and include consumption of government capital, while unified budget outlays do the reverse; (3) NIPA accounts exclude Puerto Rico and U.S. territories; and (4) various timing issues are handled differently. **Outlays and Receipts** are from the NIPAs, except as noted. Since 1977, the federal **Fiscal Year** starts on October 1. Excluded agency debt was 0.6 percent of federal debt at the end of fiscal 1997. **Federal Debt Held by the Public** includes holdings of the Federal Reserve System and excludes holdings of the social security and other federal trust funds. Federal grants in aid to state and local governments appear in both state and local receipts and federal outlays.

Pages 18, 19: The **Trade Balance** (shown on a balance of payments basis) is the difference between exports and imports of goods (merchandise) and services. It is nearly identical in concept to the **Net Exports** component of GDP, but differs slightly in accounting details. The **Investment Income Balance** equals income received from U.S.-owned assets in other countries minus income paid on foreign-owned assets in the U.S. The investment income balance is nearly identical in concept to the difference between gross national product and gross domestic product, but differs in accounting details. The **Current Account Balance** is the trade balance plus the balance on investment income plus net unilateral transfers to the U.S. from other countries.

Pages 20, 21: Output per Hour (Y/H), Unit Labor Cost (C/Y), and Compensation per Hour (C/H) are indexes which approximately obey the following relationship: %(Y/H) + %(C/Y) = %(C/H) with %() meaning percent changes. Unit labor cost is shown on page 9. Real Compensation per Hour uses the CPI to adjust for the effects of inflation. Nonfarm business accounted for about 77 percent of the value of GDP in 2000, while nonfinancial corporations accounted for about 54 percent. Inventory Valuation Adjustments (IVA) remove the effect of changes in the value of existing inventories from corporate profits and proprietors' income. (This change in value does not correspond to current production and therefore is not part of GDP). Capital Consumption Adjustments (CCAdj) increase profits and proprietors' income by the difference between estimates of economic depreciation and depreciation allowed by the tax code. Components of national income not shown are rental income of persons and net interest.

Pages 22, 23: The economic projections of the **Federal Open Market Committee (FOMC)** are published four times a year. Except for the unemployment rate, the projections for the current and following years are on a Q4/Q4 horizon. The shaded area represents the range of the economic projections of the FOMC members, and the dot signifies the mid-point of the ranges. The projections of the changes in the total PCE price index and the core PCE price index (excluding food and energy prices) are presumed to converge over time.
