Price Movements

April 1978

Summary

The Producer Price Index for Finished Goods moved up 1.3 percent from March to April on a seasonally adjusted basis, considerably more than the increases recorded in most recent months. This acceleration was due to larger advances for finished consumer foods and consumer durables, especially jewelry (table A). More than one-fourth of the April rise in the Finished Goods Price Index was caused by jewelry prices. Prices of commodities at the intermediate (semifinished) stage of processing rose somewhat less than in March. Prices of crude materials increased more in April than in March because of advances for a broad range of crude food products.

Among finished goods, prices for finished consumer foods rose 1.9 percent in April, following increases of 0.8 and 2.9 percent in March and February, respectively. (The Finished Goods Price Index reflects only changes in prices received by producers for goods that are in the form in which they eventually are sold to final users. See "Brief

Explanation of Producer Price Index," page 78.) The index for finished consumer goods excluding foods advanced 1.3 percent over the month, principally because a steep rise in jewelry prices helped to raise the consumer durables index 2.8 percent (table B). The index for capital equipment (formerly called producer finished goods) rose 0.6 percent, about the same as in most recent months. The Producer Price Index for intermediate materials rose 0.5 percent in April, somewhat less than the increases registered during the first 3 months of this year. (Intermediate materials are semifinished commodities which have been processed but which require further processing before they become finished goods.) The index for crude materials increased 2.5 percent over the month, the seventh consecutive monthly advance. (Crude materials are products entering the market for the first time which have not been manufactured or fabricated but which will be processed further before becoming intermediate or finished goods.)

r= revised.

Before seasonal adjustment, the Producer Price Index for Finished Goods increased 1.3 percent to 191.4 (1967=100). Over the year, the Finished Goods Price Index was up 7.0 percent. The finished consumer foods index rose 8.5 percent from April 1977 to April 1978, the capital equipment index was up 7.6 percent, and the index for finished consumer goods excluding foods was 5.9 percent higher than a year earlier. The intermediate materials price index increased 5.6 percent over the past year, and the Producer Price Index for crude materials was up 5.7 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods (those eventually sold to retailers) advanced 1.6 percent in April. Prices rose more than in the prior month for both finished consumer foods and for finished consumer goods other than foods.

The index for finished consumer foods advanced 1.9 percent from March to April, more than in March (0.8 percent) but less than in February (2.9 percent). Prices for processed poultry and pork turned up in April after declining in March. Fresh and dried fruits and vegetables, dairy products, and miscellaneous processed foods rose more than in March. Roasted coffee prices fell much less than in most recent months. On the other hand, prices for beef and veal and processed fruits and vegetables continued to increase but less than in March, and milled rice and refined vegetable oil prices turned down after rising in March.

The index for consumer durables rose 2.8 percent in April, following a 0.6 percent rise in March. Most of the

acceleration in April was caused by a sharp rise in the index for jewelry, which partly reflected the increase in gold prices during late 1977 and early 1978. Prices also rose more than in March for passenger cars, floor coverings, household furniture, and household appliances.

The index for consumer nondurable goods other than foods rose 0.4 percent over the month, about the same as in each month since last October. The largest increases in April occurred for leather footwear, rubber footwear, tires and tubes, and sanitary papers and health products. Prices for gasoline and home heating oil turned up following 2 months of decreases.

Capital equipment. The Producer Price Index for capital equipment advanced 0.6 percent in April, the same as the average monthly increase during the past 12 months. Some of the largest price increases in April were registered for railroad equipment, industrial process furnaces and ovens, construction machinery and equipment, and machine tools. Prices of commercial furniture and mining machinery and equipment moved up much less than in March.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components rose 0.5 percent from March to April after seasonal adjustment, following increases of 0.8 percent in March and 0.9 percent in both February and January. The April deceleration was due to prices for intermediate foods and feeds, which edged up 0.1 percent after advancing sharply in each of the first 3 months of 1978. Most of this slowdown was caused by a reversal in prices of manufactured animal feeds, which fell in April after a

rapid upward movement during the first quarter of the year. On the other hand, prices of flour and confectionery materials rose much more from March to April than they did in the entire first quarter.

The index for intermediate materials excluding materials used in food manufacturing and manufactured animal feeds moved up 0.5 percent over the month, the same as in March but less than in either February or January. Prices advanced more than in March for steel mill products, foundry and forge shop products, motor vehicle parts, paper, and cement. After declining in the previous month, prices were higher in April for asphalt roofing, gypsum products, mixed fertilizers, industrial chemicals, and diesel fuel. Prices of residual fuel and plywood fell less than in either of the 2 preceding months. On the other hand, prices decreased in April after rising in March for liquefied petroleum gas, coke, electric power, nonferrous mill shapes, and glass containers. Prices rose less than in March for building paper and board, paperboard, millwork, and gray fabrics.

Crude materials

The Producer Price Index for crude materials for further processing was up 2.5 percent from March to April on a

seasonally adjusted basis. This was more than the 1.6 percent increase in March but less than the 3.2 percent advance in February. Prices of crude foodstuffs and feedstuffs moved up twice as much in April (3.7 percent) as in March (1.8 percent). Prices for grains and fresh and dried fruits and vegetables rose much more than in the previous month, and live poultry and raw sugar prices turned up following March decreases. On the other hand, prices of oilseeds and cattle rose much less in April than in the preceding month. Fluid milk and hog prices turned down after increasing in March, and green coffee prices declined for the fourth consecutive month.

The index for crude nonfood materials increased 0.9 percent over the month, following rises of 1.5 percent in March and 1.0 percent in February. Raw cotton prices declined after 3 consecutive months of rapid advances. Wastepaper prices fell for the third consecutive month after increasing sharply from October through January. Prices for hides and skins also decreased in April. On the other hand, prices for both nonferrous and ferrous scrap moved up in April following declines in the previous month. Among crude fuels, coal prices rose much more than in recent months, and natural gas increased nearly as much as in March.

¹ Commodities at the subproduct class (6-digit) level are assigned to stage of processing (SOP) indexes according to the amount of processing, manufacturing, or assembling to which those commodities are subjected before they enter the market. The weight of each subproduct class is allocated among the various SOP indexes in accordance with the relative proportion of output consumed at each level of processing. SOP allocations are placed within parentheses for those commodity groupings whose subproduct classes are not uniformly divided among different stage of

processing categories. Such figures indicate the weighted average allocated to a particular stage of processing category as of December 1977.

¹ Standard Transportation Commodity Code.

² The price index for total railroad freight also includes STCC groups not shown separately.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in

the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or in shipper costs that result from changes in services or mode.

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well

as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and non-durables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage of processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Wholesale Price Index and the Industrial Commodities Price Index

would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities WPI uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from pro-

ducing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 85 percent from the reference period in the Finished Goods Price Index, for example, is shown as 185.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$185."

A Note about Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The following example illustrates the computation of index point and percent changes. (See box.)

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

<i>Index Point Change</i>	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
<i>Index Percent Change</i>	
Index point change	<u>1.0</u>
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

A Note on Seasonally Adjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays.

For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

A NEW BLS HANDBOOK OF METHODS

For Surveys and Studies • 1976 Edition

Chapters contain a brief account of each major program and what it attempts to do, where the basic data come from, definition of terms and concepts. Sources of more information—some more popular, some more technical—are listed. Included are program descriptions for:

Labor force, employment, and unemployment
Labor turnover
Occupational employment statistics

Consumer expenditures and income
Consumer and wholesale prices
Occupational pay and supplementary benefits
Current wage developments
Union and association membership
Wage chronologies and salary trend reports
Productivity measures: Private sector
Output per employee hour measures: Industries and Federal Government
Occupational safety and health statistics
Economic growth studies
Employment cost index
