Price Movements

August 1978

Summary

The Producer Price Index for Finished Goods edged down 0.1 percent from July to August on a seasonally adjusted basis. The August decline was the result of lower food prices and followed increases of 0.5 percent in July and 0.7 percent in both June and May (table A). Prices for intermediate (semifinished) goods increased about as much as in most recent months. Crude materials prices decreased for the second consecutive month, following a period of sharply rising prices from September 1977 through June 1978.

In August, finished consumer food prices fell 1.5 percent, the largest decline in 2 years. The index for finished consumer goods other than foods moved up 0.4 percent over the month, considerably less than the 1 percent rise in July (table B). The deceleration was caused by slower price increases for both consumer durables and nondurables excluding foods. Prices for capital equipment rose about as much as in July but less than in other months

so far this year. (The Finished Goods Price Index reflects only changes in prices received by producers for goods that are in the form in which they eventually are sold to final users. See "Brief Explanation of Producer Price Indexes," page 85.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved down 0.3 percent to 195.3 (1967=100). Over the year, the Finished Goods Price Index rose 7.7 percent. The finished consumer foods index was up 8.4 percent from August 1977 to August 1978, the index for finished consumer goods other than foods increased 7.1 percent, and the capital equipment index was 8.1 percent higher than a year earlier. The Producer Price Index for intermediate goods rose 6.8 percent over the year, and crude materials prices advanced 15.6 percent.

declined 0.3 percent in August after seasonal adjustment, the first decrease since June 1977. This index had registered an average increase of 0.6 percent per month during the previous 13 months. The finished consumer foods index decreased more than in the preceding month, and the indexes for both consumer durables and nondurables rose less than in July.

The finished consumer foods index declined 1.5 percent in August, following a 0.3 percent decrease in July and generally large advances in the 9 months before July. Prices turned down sharply after rising a month earlier for processed poultry, fresh and dried fruits and vegetables, and eggs. Prices for roasted coffee, vegetable oil end products, and whole black pepper fell more than in July. Beef and veal prices fell about as much as in the prior month. On the other hand, prices for pork and dairy products turned up after declining a month earlier. Fish prices increased somewhat more than in July, and processed fruits and vegetables rose about as much in August as in July.

The index for consumer durables moved up 0.7 percent over the month, after a sharp rise in July (1.8 percent) and a small increase in June (0.2 percent). Jewelry prices advanced markedly less in August than in the preceding month. Household flatware prices also rose less than in July. Prices turned down after increasing a month before for floor coverings. After rising in July, dinnerware prices were unchanged in August. On the other hand, prices for mobile homes rose somewhat faster than in July. Price increases for passenger cars, household furniture, and appliances were about the same as in the previous month.

The index for consumer nondurable goods other than foods rose 0.3 percent from July to August, compared with increases of 0.6 percent in each of the 2 preceding months. Prices for tobacco products increased much less than in either July or June. After advancing in July, prices for apparel, sanitary papers and health products, finished lubricants, and prescription drugs were virtually unchanged in August. On the other hand, prices fell much less than in July for tires and tubes, and gasoline prices turned up after declining in July. Alcoholic beverages and leather footwear increased more than in the previous month.

Capital equipment. The Producer Price Index for capital equipment moved up 0.4 percent in August, about the same as in July (0.5 percent) and somewhat less than in June (0.8 percent). Prices were higher in August for machine tools, hand tools, internal combustion engines, and mining machinery.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components rose 0.5 percent in August, seasonally adjusted, the same as in July. The index for intermediate materials excluding foods and feeds increased 0.7 percent over the month, somewhat more than in any of the preceding 5 months. Much of this acceleration was caused by steel mill products, which advanced substantially for the third time this year. Prices for primary nonferrous metal refinery shapes, fabricated metal products, lumber, leather, refractories, and concrete products rose considerably more than in the previous month, and plywood and

plastic construction products turned up following decreases in July. On the other hand, prices for inedible fats and oils, motor vehicle parts, building paper and board, and millwork fell after increasing in July. Liquefied petroleum gas and residual fuels declined more than in the preceding month.

The index for intermediate foods and feeds moved down 3.4 percent from July to August, following a 1.5 percent increase in July. This reversal was principally due to prices for manufactured animal feeds, which turned sharply lower in August after registering a large advance in July. In contrast, prices for flour and for refined sugar for food manufacturing rose following July decreases. Confectionery materials also increased in August but not as much as in the previous month. (Intermediate materials are semifinished commodities which have been processed but which require further processing before they become finished goods.)

Crude materials

The Producer Price Index for crude materials for further processing declined 1.3 percent from July to August

after seasonal adjustment, following a 0.6 percent decrease in July and a 1.8 percent advance in June. The index for crude nonfood materials moved down for the first time in nearly a year. Prices for natural gas and leaf tobacco fell after rising in July. Crude petroleum prices increased substantially less than in either of the 2 preceding months. On the other hand, prices for hides and skins, plant and animal fibers, and nonferrous scrap turned up following declines in July. Iron and steel scrap and crude natural rubber rose more in August than in the previous month.

The index for crude foodstuffs and feedstuffs decreased for the second consecutive month. Prices for grains and green coffee dropped more than in July. Oilseeds and live poultry turned down after increasing in July. Livestock prices also decreased but not as much as in the prior month. Fluid milk prices rose less than in any other month so far this year. On the other hand, raw cane sugar prices turned up following a July decline, and cocoa beans advanced more than in July. (Crude materials are products entering the market for the first time which have not been manufactured or fabricated but which will be processed further before becoming intermediate or finished goods.)

¹ Commodities at the subproduct class (8-digit) level are assigned to stage-of-processing (SOP) indexes according to the amount of processing, manufacturing, or assembling to which those commodities are subjected before they enter the market. The weight of each subproduct class is allocated among the various SOP indexes in accordance with the relative proportion of output consumed at each level of processing. SOP allocations are placed within parentheses for those commodity groupings whose subproduct classes are not uniformly divided

among different stage-of-processing categories. Such figures indicate the weighted average allocated to a particular stage-of-processing category as of December 1977.

Technical Note: Test Data for Producer Price Index Revision

Test data from the pilot survey for the Producer Price Index (PPI) revision have been developed for the period beginning January 1978 and are published each month in table 14, "Producer price indexes for the net output of selected industries and products," in this report. The revision is being undertaken as a comprehensive effort to make major improvements in the measurement of price changes by domestic producers of goods and services. The data now available are from a pilot survey conducted to test the methods and procedures for the comprehensive revision. The revision will be conducted on an industry-by-industry basis. The results for the first industries in the full-scale survey will be available in the fall of 1979. Coverage of all mining and manufacturing industries is scheduled for completion in 1984.

The four industries covered in the pilot survey are: Soybean oil mills (SIC 2075), newspaper printing and publishing (SIC 2711), concrete products other than block and brick (SIC 3272), and household laundry equipment (SIC 3633). These industries were selected because they offered a wide range of pricing problems on which to test the new techniques. Indexes covering some of these same industries will continue to be calculated under the old program. The new indexes will not begin replacing the old ones in the Producer Price Index until early 1980.

These pilot survey indexes differ from indexes in the current Producer Price Index in a number of important respects:

- (1) They are *industry-based* indexes. The entire output of each industry is sampled, including secondary production and miscellaneous receipts. The current Producer Price Indexes are based on a sample of major products. Even the Industry-Sector Price Indexes (ISPI's) are derived from these product indexes. The current ISPI's do not price miscellaneous receipts, and the prices for primary and secondary production are obtained from any producer of the product even if that producer does not belong to the industry. The newly published pilot survey indexes are derived from prices supplied strictly by producers within the industry. As a result, the pilot product indexes apply only to the production within the industry. After all mining and manufacturing industries are covered by the revision, product indexes will be constructed covering all production of the product.
- (2) These new indexes are classified in accordance

with the *Standard Industrial Classification* (SIC) system and incorporate most features of the Census of Manufactures product code extensions of the SIC. The coding will make the data easier to use in conjunction with other industry-oriented economic data.

- (3) *Net output values of shipments* are used as weights in preparing the index. Net output values refer to the value of shipments leaving the industry. In contrast, the weights used in the current PPI's and ISPI's are gross shipment values, which include shipments *within* an industry. The resulting multiple counting of price changes is one of the major defects of the current indexes. The current stage-of-processing indexes partially correct this defect, but the new indexes consistently correct it at all levels.
- (4) Increased emphasis is being given to obtaining actual *transaction prices at the time of shipment*. Although it has been a general objective of the current program to obtain transaction prices, they have not been obtained for significant portions of the index. In addition, some products in the current PPI intentionally have been priced at order prices rather than shipment prices.
- (5) *Probability sampling* was used to select the firms to be asked to report prices. As a result, firms of all sizes are included in the sample. In addition, within the firm, the individual items to be priced and the terms of the transaction were chosen using probability techniques. In the current PPI, major companies selected on a judgment basis are asked to report prices for volume-selling items under "typical" transaction terms.

Since this is a pilot survey, a number of changes will be introduced as the full-scale survey is put in place. These changes include the following:

- (1) Greater product detail will generally be available because of larger sample sizes and increased capabilities to combine product areas that are not publishable by themselves. The 5-digit product class indexes, which cannot now be calculated, will be produced.
- (2) Ultimately, the survey will cover all shipments by all 493 industries in mining and manufacturing. The present PPI's cover only about 50 percent of this value; the pilot survey covers about 2 percent of it.

(3) Improved calculation techniques will be introduced, including the use of Census of Manufactures shipment data to weight the 7-digit product indexes to higher levels. The pilot indexes rely on the estimated relative importance of products based on shipment data derived from the survey itself.

(4) Estimates of sampling error will be published.

Early, in the April 1978 issue of the *Monthly Labor Review*. Reprints are available from the Bureau of Labor Statistics upon request.

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well

as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and non-durables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage of processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Wholesale Price Index and the Industrial Commodities Price Index

would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities WPI uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from pro-

ducing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 85 percent from the reference period in the Finished Goods Price Index, for example, is shown as 185.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$185."

A Note about Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The following example illustrates the computation of index point and percent changes. (See box.)

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

<i>Index Point Change</i>	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>

<i>Index Percent Change</i>	
Index point change	1.0
divided by the previous index	<u>184.5</u>
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

A Note on Seasonally Adjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays.

For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.
