Price Movements

September 1978

Summary

The Producer Price Index for Finished Goods moved up 0.9 percent from August to September on a seasonally adjusted basis. The September advance followed a 0.1 percent decline in August and a 0.5 percent rise in July (table A). Prices for intermediate (semifinished) goods increased somewhat more than in most recent months. Crude materials prices moved up following decreases in both of the previous 2 months. The acceleration in the price indexes for all three stages of processing was caused primarily by a sharp upturn in food prices.

Before seasonal adjustment, the Producer Price Index for Finished Goods increased 0.8 percent to 196.9 (1967=100). Over the year, the Finished Goods Price Index rose 8.2 percent. The finished consumer foods index was up 10.2 percent from September 1977 to September 1978, the index for finished consumer goods other than foods increased 7.1 percent, and the capital equipment index

was 8.3 percent higher than a year earlier. The Producer Price Index for intermediate goods rose 7.1 percent over the year, and crude materials prices advanced 17.9 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods (those eventually sold to retailers) advanced 0.9 percent from August to September after seasonal adjustment (table B). This index had declined 0.3 percent in August after increasing in each month since June 1977. In September, finished consumer foods prices rose 1.7 percent, in contrast to the declines registered in August (1.5 percent) and July (0.3 percent). Food prices had risen sharply during the first half of the year. The index for finished consumer goods other than foods was 0.5 percent higher in September, slightly more than the 0.4 percent rise in August but considerably less than the 1 percent advance in July. Prices for consumer nondurables

other than foods rose somewhat more than in August but about as much as in July. The index for consumer durables rose much less than in the previous 2 months.

Much of the reversal in food prices was caused by an upturn in prices for beef and veal. Prices also turned up after decreasing in August for processed poultry, vegetable oil end products, and whole black pepper. Prices rose more than in August for refined sugar in consumer size packages. Prices also rose, but less than in August, for pork, fish, dairy products, processed fruits and vegetables, and flour base mixes and doughs. Prices for fresh and dried fruits and vegetables, eggs, and milled rice declined. Roasted coffee prices were unchanged after decreasing in August.

The index for consumer nondurables other than foods rose 0.6 percent in September, somewhat more than the 0.3 percent increase in August. Prices turned up in September after declining a month earlier for rubber footwear, home heating oil, and textile housefurnishings. Prices rose over the month after showing no change in August for non-alcoholic beverages, prescription drugs, and soaps and synthetic detergents. Compared with last month, larger increases were registered for gasoline, over-the-counter drugs, and disposable plastic dinnerware and tableware. On the other hand, prices for finished lubricants moved down after no change in August. Prices for tires and tubes fell somewhat more than in the preceding month. Prices for leather footwear, alcoholic beverages, and sporting and athletic goods rose less than in August.

The index for consumer durables moved up 0.4 percent in September, much less than in August (0.7 percent) and July (1.8 percent). Prices turned down in September after

increasing in August for luggage and small leather goods, household appliances, and household flatware. Prices for household furniture rose less than in August. Prices for jewelry and electronic hearing aids were unchanged after increasing in August. On the other hand, prices for home electronic equipment turned up after declining in August, and prices for dinnerware moved up in September after no change in the previous month. Prices rose more than in the preceding month for passenger cars, mobile homes, and lawnmowers. Prices for floor coverings fell less in September than in August.

Capital equipment. The Producer Price Index for capital equipment advanced 0.6 percent in September, somewhat more than in August (0.4 percent) and about as much as in most other months this year. Prices for motor trucks and photographic equipment turned up after declining in August. Prices rose more than in August for railroad equipment, fixed wing utility aircraft, agricultural machinery and equipment, and metal forming machine tools. Prices turned up following no change in August for pumps, compressors, and equipment and unitary air conditioners.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components rose 0.7 percent in September on a seasonally adjusted basis, following 0.5 percent advances in both August and July. The larger increase was caused by an upturn in the intermediate foods and feeds index, which registered a 2.2 percent increase after falling 3.4 percent in August. Prices for animal fats and oils and

crude vegetable oils turned up following declines in August. Prices for refined sugar for food manufacturing and confectionery materials also rose. In contrast, prices for flour decreased after rising in August. The index for manufactured animal feeds also moved down but much less than in the preceding month.

The index for intermediate materials excluding foods and feeds rose 0.6 percent, slightly less than 0.7 percent increase registered in August. Prices for steel mill products were virtually unchanged after a large advance in August. Prices for construction materials rose much less than in most recent months. Price increases for lumber, plastic construction products, and concrete products were smaller than in August. Plywood and refractories prices turned down after rising in August, and building paper and board prices fell more than in the previous month. On the other hand, prices for many materials for nondurable manufacturing, particularly paper products, gray fabrics, leather, and inedible fats and oils, registered large increases over the month. Prices for nondurable manufacturing materials had generally risen much less in other months so far this year. Among processed fuels, prices for residual fuels rose after falling in the 2 preceding months, and liquefied petroleum gas prices were higher after declining for 7 consecutive months.

Crude materials

The Producer Price Index for crude materials for further processing advanced 1.6 percent seasonally adjusted in September, contrasting with the 1.3 percent decline in August. The index for crude foodstuffs and feedstuffs turned sharply upward, increasing 1.9 percent following a 1.8 percent drop in August. Prices for livestock, green coffee, oilseeds, and live poultry rose after declining in August. Cocoa bean prices also rose, but less than in the previous month. On the other hand, raw cane sugar prices fell somewhat after rising sharply in August. Grain prices also decreased, but not as much as in any of the 4 preceding months.

The index for crude nonfood materials rose 1.0 percent in September, reversing the 0.5 percent decline of the previous month. Natural gas prices turned up after declining in August, and crude petroleum registered a larger price increase than in the prior month. Prices for hides and skins, crude natural rubber, nonferrous scrap, and plant and animal fibers also advanced. On the other hand, iron and steel scrap prices fell after rising in August, and wastepaper prices decreased for the third consecutive month. Coal prices rose less than in August.

¹ Commodities at the subproduct class (6-digit) level are assigned to stage-of-processing (SOP) indexes according to the amount of processing, manufacturing, or assembling to which those commodities are subjected before they enter the market. The weight of each subproduct class is allocated among the various SOP indexes in accordance with the relative proportion of output consumed at each level of processing. SOP allocations are placed within parentheses for those commodity groupings whose subproduct classes

are not uniformly divided among different stage-of-processing categories. Such figures indicate the weighted average allocated to a particular stage-of-processing category as of December 1977.

¹ Standard Transportation Commodity Code.

² The price index for total railroad freight also includes STCC groups not shown separately.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads'

prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or in shipper costs that result from changes in services or mode.

Technical Note: Test Data for Producer Price Index Revision

Test data from the pilot survey for the Producer Price Index (PPI) revision have been developed for the period beginning January 1978 and are published each month in table 14, "Producer price indexes for the net output of selected industries and products," in this report. The revision is being undertaken as a comprehensive effort to make major improvements in the measurement of price changes by domestic producers of goods and services. The data now available are from a pilot survey conducted to test the methods and procedures for the comprehensive revision. The revision will be conducted on an industry-by-industry basis. The results for the first industries in the full-scale survey will be available in the fall of 1979. Coverage of all mining and manufacturing industries is scheduled for completion in 1984.

The four industries covered in the pilot survey are: Soybean oil mills (SIC 2075), newspaper printing and publishing (SIC 2711), concrete products other than block and brick (SIC 3272), and household laundry equipment (SIC 3633). These industries were selected because they offered a wide range of pricing problems on which to test the new techniques. Indexes covering some of these same industries will continue to be calculated under the old program. The new indexes will not begin replacing the old ones in the Producer Price Index until early 1980.

These pilot survey indexes differ from indexes in the current Producer Price Index in a number of important respects:

- (1) They are *industry-based* indexes. The entire output of each industry is sampled, including secondary production and miscellaneous receipts. The current Producer Price Indexes are based on a sample of major products. Even the Industry-Sector Price Indexes (ISPI's) are derived from these product indexes. The current ISPI's do not price miscellaneous receipts, and the prices for primary and secondary production are obtained from any producer of the product even if that producer does not belong to the industry. The newly published pilot survey indexes are derived from prices supplied strictly by producers within the industry. As a result, the pilot product indexes apply only to the production within the industry. After all mining and manufacturing industries are covered by the revision, product indexes will be constructed covering all production of the product.
- (2) These new indexes are classified in accordance

with the *Standard Industrial Classification* (SIC) system and incorporate most features of the Census of Manufactures product code extensions of the SIC. The coding will make the data easier to use in conjunction with other industry-oriented economic data.

- (3) *Net output values of shipments* are used as weights in preparing the index. Net output values refer to the value of shipments leaving the industry. In contrast, the weights used in the current PPI's and ISPI's are gross shipment values, which include shipments *within* an industry. The resulting multiple counting of price changes is one of the major defects of the current indexes. The current stage-of-processing indexes partially correct this defect, but the new indexes consistently correct it at all levels.
- (4) Increased emphasis is being given to obtaining actual *transaction prices at the time of shipment*. Although it has been a general objective of the current program to obtain transaction prices, they have not been obtained for significant portions of the index. In addition, some products in the current PPI intentionally have been priced at order prices rather than shipment prices.
- (5) *Probability sampling* was used to select the firms to be asked to report prices. As a result, firms of all sizes are included in the sample. In addition, within the firm, the individual items to be priced and the terms of the transaction were chosen using probability techniques. In the current PPI, major companies selected on a judgment basis are asked to report prices for volume-selling items under "typical" transaction terms.

Since this is a pilot survey, a number of changes will be introduced as the full-scale survey is put in place. These changes include the following:

- (1) Greater product detail will generally be available because of larger sample sizes and increased capabilities to combine product areas that are not publishable by themselves. The 5-digit product class indexes, which cannot now be calculated, will be produced.
- (2) Ultimately, the survey will cover all shipments by all 493 industries in mining and manufacturing. The present PPI's cover only about 50 percent of this value; the pilot survey covers about 2 percent of it.

(3) Improved calculation techniques will be introduced, including the use of Census of Manufactures shipment data to weight the 7-digit product indexes to higher levels. The pilot indexes rely on the estimated relative importance of products based on shipment data derived from the survey itself.

(4) Estimates of sampling error will be published. For further information on the underlying concepts and methodology of the Producer Price Index revision, see "Improving the Measurement of Producer Price Change," by John F. Early, in the April 1978 issue of the *Monthly Labor Review*. Reprints are available from the Bureau of Labor Statistics upon request.

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables,

as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage of processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Wholesale Price Index and the Industrial Commodities Price Index

would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities WPI uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from pro-

ducing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 85 percent from the reference period in the Finished Goods Price Index, for example, is shown as 185.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$185."

A Note about Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The following example illustrates the computation of index point and percent changes. (See box.)

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

<i>Index Point Change</i>	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
<i>Index Percent Change</i>	
Index point change	<u>1.0</u>
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

A Note on Seasonally Adjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays.

For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.
