Producer Prices and Price Indexes is a monthly report on producer price movements including statistical tables and technical notes. It may be ordered from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Subscription Price:
\$17 a year domestic (includes
one supplement)
\$4.25 additional foreign

Single copy \$2.25.
Supplement \$2.75.

Producer Prices and Price Indexes

Data for October 1979

Price Changes

The Government Printing Office has announced higher prices for *Producer Prices and Price Indexes*, effective in November 1979. The subscription price has increased 6 percent, from \$16 to \$17 a year within the United States; the single copy price has increased 25 percent, from \$1.80 to \$2.25.

Prices of U.S. Government publications are set by the Government Printing Office, an agency of the U.S. Congress, under authority of Title 44 of the U.S. Code. This statute does not give publishing agencies, like the Bureau of Labor Statistics, a voice in setting prices of the publications they publish.

Price Movements

October 1979

The Producer Price Index for Finished Goods moved up 1.0 percent from September to October on a seasonally adjusted basis. The October advance was somewhat smaller than in either August or September. Prices for intermediate (semifinished) goods increased 1.8 percent, the largest rise so far this year. Crude material prices advanced 1.5 percent, far more than in August but not so much as in September (table A).

Among finished goods, the index for finished energy goods continued to climb rapidly (4.7 percent), although at a somewhat slower pace than in the past several months. (A number of energy-related indexes are now shown in table 1.) Consumer food prices edged down 0.1 percent, following 2 months of substantial increases. The index for finished consumer goods less food and energy moved up 0.8 percent, about the same as in August and September. Capital equipment prices, however, increased 1.2 percent, considerably more than in any of the 5 preceding months (table B).

Before seasonal adjustment, the Producer Price Index for Finished Goods moved up 1.5 percent to 223.7 (1967=100). Over the year, the Finished Goods Price

Index increased 12.1 percent. The finished energy goods index was up 60.5 percent from October 1978 to October 1979, the finished consumer foods index rose 6.9 percent, the index for finished consumer goods other than food and energy was 9.2 percent higher than a year ago, and capital equipment prices were up 8.9 percent. The Producer Price Index for intermediate goods increased 15.3 percent over the year, and prices for crude materials advanced 16.1 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods advanced 1.0 percent, compared with an increase of 1.8 percent in September. Much of the October slowdown was caused by food prices, which edged down following a 1.8 percent advance in the preceding month. In October, price increases accelerated for consumer durable goods. Prices for consumer nondurables other than food continued to rise rapidly but not as sharply as in other recent months.

The finished consumer foods index declined 0.1 percent in October, following large advances in the preceding 2 months. Prices for beef and veal and pork turned down after rising sharply a month earlier. Prices also turned down for eggs, processed fruits and vegetables, and dairy products following September advances. Fresh fruit prices fell but not as much as in September. These declines offset increases for fresh and dried vegetables, processed poultry, fish, vegetable oil end products, refined sugar in consumer-size packages, and roasted coffee.

The index for consumer durables rose 1.1 percent more than in any month since January. Much of the October advance was due to an upturn in prices for passenger cars and a 39.1 percent price increase for household flatware. (Prices for 1980 model year automobiles were reflected for the first time in October. See release titled "Report on Quality Changes for 1980 Model Passenger Cars.") Large advances were also posted for precious metal jewelry, mobile homes, cutlery, lawnmowers, dinnerware, and floor coverings.

The index for consumer nondurables other than foods increased 1.8 percent, less than in any of the past 4 months. The slower rise in October was due to energy goods: Gasoline and home heating oil prices moved up 5.1 and 4.7 percent, respectively, compared with advances of 6.2 and 7.9 percent in September. Price increases also slowed significantly for tires and tubes, textile housefurnishings, soaps and synthetic detergents, and disposable plastic dinnerware. Price increases accelerated, however, for pharmaceutical preparations and alcoholic beverages.

Capital equipment. The index for capital equipment advanced sharply (1.2 percent), following 5 months of much more moderate increases. Much of the October advance was due to prices for motor trucks, which rose 4.0 percent after falling about 3 percent during the third quarter. Other large increases included machine tools, plastic and rubber industry machinery, construction machinery, industrial material handling equipment, oilfield machinery, transformers and power regulators, unitary air conditioners, and agricultural machinery.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components rose 1.8 percent in October on a seasonally adjusted basis, even more than the 1.5 percent increase in September. This acceleration resulted from large price hikes for a number of manufacturing and construction materials. Energy prices continued to move up rapidly, but not as much as in recent months.

The index for intermediate materials less food and energy advanced 1.7 percent, more than in any month since August 1974. The durable manufacturing materials category recorded an even larger increase (2.3 percent) than in the previous month (1.6 percent). Price increases accelerated for finished steel products, copper, aluminum, foundry and forge shop products, and hardwood lumber. Prices for precious metals and jewelers' materials and findings rose almost as steeply as in September.

The nondurable manufacturing materials index also advanced more than in the previous month (1.9 vs. 1.2 percent). Price increases accelerated sharply for wood-pulp, paper, phosphates, and industrial chemicals. Prices for leather and inedible fats and oils turned up after falling in September. Large advances were also recorded for plastic resins and materials, synthetic fibers, processed yarns and threads, paperboard, nitrogenates, and paint materials.

The index for construction materials and components rose 1.6 percent, the biggest increase so far this year. Price increases accelerated sharply for nonferrous wire and cable, millwork, fabricated structural metal products, valves and fittings, and insulating materials. In contrast, prices for softwood lumber, plywood, plastic construction products, asphalt roofing, and gypsum products declined somewhat after rising in September.

Among other intermediate nonfood nonenergy goods, some of the largest price advances occurred for photographic supplies, metal containers, mixed fertilizers, unsupported plastic film and sheeting, fluid power equipment, metal cutting machine tool parts, nonfarm tractor parts, farm machinery parts, abrasive products, and motor vehicle parts.

The processed fuels and lubricants index moved up 3.1 percent, the smallest increase since April. Price increases moderated for commercial jet fuel, diesel fuel, residual fuel, and liquefied petroleum gas. On the other hand, the electric power index rose considerably more than in any month during the third quarter.

The intermediate foods and feeds index rose 0.5 percent, slightly less than in September. The October increase was almost entirely due to a sharp advance in manufactured animal feeds prices. Prices declined, however, for animal fats and oils, crude vegetable oils, refined vegetable oils, and confectionery materials.

Crude materials

The Producer Price Index for crude materials for further processing rose 1.5 percent on a seasonally ad-

justed basis, following a 2.1 percent increase in the previous month. The deceleration was due to slower price increases for foodstuffs and energy materials.

The index for crude foodstuffs and feedstuffs moved up 0.5 percent, following a 1.5 percent rise in the preceding month. The slowdown was primarily due to lower prices for hogs and cattle, which had turned up sharply in September after falling for several months. Prices for wheat and cocoa beans also fell. In contrast, corn and sugar prices rose considerably. Higher prices were also registered for soybeans, live poultry, and green coffee.

Prices for crude energy materials increased 2.5 percent over the month, compared with a 4.7 percent advance in September. The 3.5 percent increase for crude petroleum was considerably less than the 9.4 percent climb last month. Natural gas prices also rose less than in September, and coal prices were virtually unchanged for the seventh consecutive month.

Among other crude materials, the index for hides and skins turned up sharply after falling substantially for 4 consecutive months. Iron and steel scrap and aluminum base scrap prices also rose sharply after several months of decreases; copper base scrap prices rose substantially for the second consecutive month, although the rise was not as steep as in September. Natural rubber and wastepaper prices also turned up after falling in the previous month. Higher prices were registered for iron ore, sand, gravel, and crushed stone, and raw cotton.

¹Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 90 percent of total intermediate materials, and about 97 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods ex-

cluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

²All data are subject to revision 4 months after original publication.

NOTE: The index is designed to measure changes in prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Technical Note: Test Data for Producer Price Index Revision

Test data from the pilot survey for the Producer Price Index (PPI) revision have been developed for the period beginning January 1978 and are published each month in table 14, "Producer price indexes for the net output of selected industries and products," in this report. The revision is being undertaken as a measurement of price changes by domestic producers of goods and services. The data now available are from a pilot survey conducted to test the methods and procedures for the comprehensive revision. The revision will be conducted on an industry-by-industry basis. The results for the first industries in the full-scale survey will be available in early 1980. Coverage of all mining and manufacturing industries is scheduled for completion in 1985.

The four industries covered in the pilot survey are: Soybean oil mills (SIC 2075), newspaper printing and publishing (SIC 2711), concrete products other than block and brick (SIC 3272), and household laundry equipment (SIC 3633). These industries were selected because they offered a wide range of pricing problems on which to test the new techniques. Indexes covering some of these same industries will continue to be calculated under the old program.

These pilot survey indexes differ from indexes in the current Producer Price Index in a number of important respects:

- (1) They are *industry-based* indexes. The entire output of each industry is sampled, including secondary production and miscellaneous receipts. The current Producer Price Indexes are based on a sample of major products. Even the Industry-Sector Price Indexes (ISPI's) are derived from these product indexes. The current ISPI's do not price miscellaneous receipts, and the prices for primary and secondary production are obtained from any producer of the product even if that producer does not belong to the industry. The newly published pilot survey indexes are derived from prices supplied strictly by producers within the industry. As a result, the pilot product indexes apply only to the production within the industry. After all mining and manufacturing industries

are covered by the revision, product indexes will be constructed covering all production of the product.

- (2) These new indexes are classified in accordance with the *Standard Industrial Classification* (SIC) system and incorporate most features of the Census of Manufactures product code extension of the SIC. The coding will make the data easier to use in conjunction with other industry-oriented economic data.
- (3) *Net output values of shipments* are used as weights in preparing the index. Net output values refer to the value of shipments leaving the industry. In contrast, the weights used in the current PPI's and ISPI's are gross shipment values, which include shipments *within* an industry. The resulting multiple counting of price changes is one of the major defects of the current indexes. The current stage-of-processing indexes partially correct this defect, but the new indexes consistently correct it at all levels.
- (4) Increased emphasis is being given to obtaining actual *transaction prices at the time of shipment*. Although it has been a general objective of the current program to obtain transaction prices, they have not been obtained for significant portions of the index. In addition, some products in the current PPI intentionally have been priced at order prices rather than shipment prices.
- (5) *Probability sampling* was used to select the firms to be asked to report prices. As a result, firms of all sizes are included in the sample. In addition, within the firm, the individual items to be priced and the terms of the transaction were chosen using probability techniques. In the current PPI, major companies selected on a judgment basis are asked to report prices for volume-selling items under "typical" transaction terms.

Since this is a pilot survey, a number of changes will be introduced as the full-scale survey is put in place. These changes include the following:

- (1) Greater product detail will generally be

available because of larger sample sizes and increased capabilities to combine product areas that are not publishable by themselves. The 5-digit product class indexes, which cannot now be calculated, will be produced.

- (2) Ultimately, the survey will cover all shipments by all 493 industries in mining and manufacturing. The present PPI's cover only about 50 percent of this value; the pilot survey covers about 2 percent of it.
- (3) Improved calculation techniques will be introduced, including the use of Census of

Manufactures shipment data to weight the 7-digit product indexes to higher levels. The pilot indexes rely on the estimated relative importance of products based on shipment data derived from the survey itself.

- (4) Estimates of sampling error will be published.

For further information on the underlying concepts and methodology of the Producer Price Index revision, see "Improving the Measurement of Producer Price Change," by John F. Early, in the April 1978 issue of the *Monthly Labor Review*. Reprints are available from the Bureau of Labor Statistics upon request.

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer

finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage of processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail ques-

tionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 85 percent from the reference period in the Finished Goods Price Index, for example, is shown as 185.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$185."

A Note about Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box below shows the computation of index point and percent changes.

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

<i>Index Point Change</i>	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
<i>Index Percent Change</i>	
Index point change	<u>1.0</u>
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

A Note on Seasonally Adjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialist, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.
