Price Movements

November 1979

The Producer Price Index for Finished Goods rose 1.3 percent from October to November on a seasonally adjusted basis. The November advance followed increases of 1.0 percent in October and 1.4 percent in September. Prices for intermediate (semifinished) goods moved up 0.9 percent, considerably less than in most recent months. Crude material prices rose 2.0 percent over the month, more than in October and about the same as in September (table A).

Among finished goods, prices for finished consumer foods climbed 2.6 percent after edging down 0.1 percent in October. Prices for finished energy goods increased 2.5 percent, the smallest monthly advance since February. The index for finished consumer goods other than food and energy rose 0.6 percent, about the same as in most other months so far this year. Capital equipment prices moved up 0.5 percent, much less than the 1.2 percent rise in October (table B).

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 1.0 percent to 225.9 (1967=100). Over the year, the Finished Goods Price Index was up 12.8 percent. The index for finished energy goods climbed 62.7 percent from November 1978 to November 1979, prices for finished consumer

foods rose 8.9 percent, the index for finished consumer goods other than food and energy was up 9.3 percent, and capital equipment prices were 8.6 percent higher than a year ago. The Producer Price Index for intermediate goods rose 15.4 percent over the year, and crude material prices advanced 17.1 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods advanced 1.6 percent, more than the 1.0 percent increase in October because of a sharp upturn in prices for foods. On the other hand, prices for nonfood finished goods, particularly home heating oil and gasoline, rose much less than a month earlier.

The finished consumer foods index rose 2.6 percent after edging down 0.1 percent in October. The November advance was the largest monthly increase since the fall of 1974. Processed poultry prices rose 21.5 percent, and prices for beef and veal, pork, and eggs turned up sharply after declining in the previous month. Prices were also sharply higher in November for roasted coffee, fresh vegetables, sugar in consumer

size packages, and macaroni. On the other hand, prices declined for fresh fruits, milled rice, and fish.

The index for consumer nondurables other than foods increased 1.1 percent, much less than in any month since February. The slowdown resulted mainly from smaller advances for home heating oil (up 0.1 percent in November vs. 4.7 percent in October) and gasoline (3.4 vs. 5.1 percent). Prices for prescription drugs turned down, and price increases slowed somewhat for over-the-counter drugs. On the other hand, price increases accelerated for finished lubricants, tires and tubes, and cosmetics.

The index for consumer durables moved up 0.8 percent in November, after rising 1.1 percent in October and 0.7 percent in September. Price increases slowed markedly for passenger cars, mobile homes, jewelry, and floor coverings. Prices for household flatware declined 1.7 percent after a 39.1-percent advance in the preceding month, and prices for cutlery and lawnmowers were unchanged after rising sharply in October. On the other hand, prices for household furniture rose at a faster pace, and dinnerware prices moved up about the same as in October.

Capital equipment. The index for capital equipment rose 0.5 percent in November, compared with an increase of 1.2 percent in October. Much of the slowdown was due to smaller advances for many machinery items and a slight decline (0.1 percent) for motor trucks, which had risen 4.0 percent a month earlier. In November, the largest increases occurred for metal forming machine tools, hand tools, scales and balances, aircraft, railroad equipment, mining machinery, and generators and generator sets.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components moved up 0.9 percent in November on a seasonally adjusted basis, only half as much as in October. Price increases slowed for manufacturing and construction materials, prices for intermediate energy goods rose less than in any month since March, and foods and feeds prices turned down slightly.

The index for intermediate materials other than food and energy rose 0.7 percent, following 2 months of sharper increases. The durable manufacturing materials index moved up 0.4 percent, considerably less than in either of the 2 previous months. Precious metal prices declined after sharp increases in September and October. Lead and zinc prices also declined. Prices moved up, but less than in the previous month, for finished steel mill products, foundry and forge shop products, copper, aluminum, tin, and jewelers' materials.

The nondurable manufacturing materials group also rose less than in most recent months. Prices for leather and inedible fats and oils turned down sharply after rising in October. Woodpulp and synthetic fibers prices edged down slightly after steep advances in the previous month. The rate of increase for industrial chemicals, plastic resins and materials, and paper slowed. Accelerating price increases were recorded, however, for nitrogenates, pharmaceutical materials, essential oils, animal hide glue, and processed yarns and threads.

The construction materials and components index also slowed considerably, edging up 0.2 percent after a 1.6-percent climb in October. Prices for softwood lum-

ber, millwork, plywood, and plastic construction products decreased. Nonferrous wire and cable prices rose, but much less than in October. On the other hand, price increases accelerated for asphalt roofing, elevators and escalators, and plumbing fixtures and brass fittings.

Among manufacturing components, some of the largest advances occurred for motor vehicle parts, fluid power equipment, and ball and roller bearings. Other intermediate nonfood nonenergy goods which registered large price increases included photographic supplies, mixed fertilizers, metal forming machine tool parts, metal containers, plastic packaging and shipping products, and wooden pallets. In contrast, prices fell for electric lamps and bulbs.

The index for intermediate energy goods rose 2.6 percent, after a 3.0-percent advance in October. Price increases slowed considerably for diesel fuel, commercial jet fuel, and electric power. On the other hand, prices rose more than in October for lubricating oil materials, liquefied petroleum gas, and residual fuel.

The intermediate foods and feeds index turned down somewhat, following a small increase in October. Lower prices were registered for manufactured animal feeds, refined vegetable oils, crude vegetable oils, and corn syrup. However, prices advanced for flour and refined sugar for use in food manufacturing.

Crude materials

The Producer Price Index for crude materials for further processing rose 2.0 percent on a seasonally adjusted basis, following a 1.5-percent increase in the pre-

vious month. The acceleration was due to a larger advance in prices for foodstuffs. Crude nonfood material prices continued to climb rapidly, although not as much as in October.

The index for crude foodstuffs and feedstuffs rose 2.0 percent, following a 0.5-percent rise in the preceding month. The faster pace in November was partly due to an unusually sharp rise in prices for live poultry (up 24.1 percent). Hog and wheat prices turned up substantially after falling in the previous month; cattle prices also turned up but not as dramatically. Fluid milk prices also rose. In contrast, prices for corn, soybeans, green coffee, and raw cane sugar dropped after rising in October, and cocoa bean prices fell much more than in October.

Prices for crude energy materials increased 1.7 percent over the month, compared with a 2.5 percent advance in October. The 3.1-percent increase for crude petroleum was the smallest since May. Natural gas prices also rose less than in any other month since last spring, and coal prices moved up only slightly.

Prices for other crude materials generally continued to rise rapidly. Prices for both ferrous and nonferrous scrap metals continued to rise sharply, but not as much as in October. Wastepaper prices moved up more than in any month since March 1976. Higher prices were also recorded for sand, gravel, and crushed stone, raw cotton, and potash. On the other hand, hides and skins prices fell steeply for the sixth time in the last 8 months, and natural rubber prices dropped after rising considerably in the preceding month.

1/Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 90 percent of total intermediate materials, and about 97 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods ex-

cluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

2/All data are subject to revision 4 months after original publication.

3/Not seasonally adjusted.

¹Data for July 1979 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices since February 1973 have a 1 month lag.

²Caution should be used in interpreting month-to-month changes, because of low response rates from the sample of reporters which ranged from 30 to 60 percent for these particular indexes.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Technical Note: Test Data for Producer Price Index Revision

Test data from the pilot survey for the Producer Price Index (PPI) revision have been developed for the period beginning January 1978 and are published each month in table 14, "Producer price indexes for the net output of selected industries and products," in this report. The revision is being undertaken as a comprehensive effort to make major improvements in the measurement of price changes by domestic producers of goods and services. The data now available are from a pilot survey conducted to test the methods and procedures for the comprehensive revision. The revision will be conducted on an industry-by-industry basis. The results for the first industries in the full-scale survey will be available in the fall of 1979. Coverage of all mining and manufacturing industries is scheduled for completion in 1984.

The four industries covered in the pilot survey are: Soybean oil mills (SIC 2075), newspaper printing and publishing (SIC 2711), concrete products other than block and brick (SIC 3272), and household laundry equipment (SIC 3633). These industries were selected because they offered a wide range of pricing problems on which to test the new techniques. Indexes covering some of these same industries will continue to be calculated under the old program. The new indexes will not begin replacing the old ones in the Producer Price Index until early 1980.

These pilot survey indexes differ from indexes in the current Producer Price Index in a number of important respects:

- (1) They are *industry-based* indexes. The entire output of each industry is sampled, including secondary production and miscellaneous receipts. The current Producer Price Indexes are based on a sample of major products. Even the Industry-Sector Price Indexes (ISPI's) are derived from these product indexes. The current ISPI's do not price miscellaneous receipts, and the prices for primary and secondary production are obtained from any producer of the product even if that producer does not belong to the industry. The newly published pilot survey indexes are derived from prices supplied strictly by producers within the industry. As a result, the pilot product indexes apply only to the production within the industry. After all mining and manufacturing industries are covered by the revision, product indexes will be constructed covering all production of the product.

- (2) These new indexes are classified in accordance with the *Standard Industrial Classification* (SIC) system and incorporate most features of the Census of Manufactures product code extensions of the SIC. The coding will make the data easier to use in conjunction with other industry-oriented economic data.
- (3) *Net output values of shipments* are used as weights in preparing the index. Net output values refer to the value of shipments leaving the industry. In contrast, the weights used in the current PPI's and ISPI's are gross shipment values, which include shipments *within* an industry. The resulting multiple counting of price changes is one of the major defects of the current indexes. The current stage-of-processing indexes partially correct this defect, but the new indexes consistently correct it at all levels.
- (4) Increased emphasis is being given to obtaining actual *transaction prices at the time of shipment*. Although it has been a general objective of the current program to obtain transaction prices, they have not been obtained for significant portions of the index. In addition, some products in the current PPI intentionally have been priced at order prices rather than shipment prices.
- (5) *Probability sampling* was used to select the firms to be asked to report prices. As a result, firms of all sizes are included in the sample. In addition, within the firm, the individual items to be priced and the terms of the transaction were chosen using probability techniques. In the current PPI, major companies selected on a judgment basis are asked to report prices for volume-selling items under "typical" transaction terms.

Since this is a pilot survey, a number of changes will be introduced as the full-scale survey is put in place. These changes include the following:

- (1) Greater product detail will generally be available because of larger sample sizes and increased capabilities to combine product areas that are not publishable by themselves. The 5-digit product class indexes, which cannot now be calculated, will be produced.
- (2) Ultimately, the survey will cover all shipments by all 493 industries in mining and manufacturing. The present PPI's cover only about 50 percent of

this value; the pilot survey covers about 2 percent of it.

- (3) Improved calculation techniques will be introduced, including the use of Census of Manufactures shipment data to weight the 7-digit product indexes to higher levels. The pilot indexes rely on the estimated relative importance of products based on shipment data derived from the survey itself.

- (4) Estimates of sampling error will be published.

Early, in the April 1978 issue of the *Monthly Labor Review*. Reprints are available from the Bureau of Labor Statistics upon request.

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished

goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage of processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Re-

spondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 85 percent from the reference period in the Finished Goods Price Index, for example, is shown as 185.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$185."

A Note about Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box below shows the computation of index point and percent changes.

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

<i>Index Point Change</i>	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
<i>Index Percent Change</i>	
Index point change	<u>1.0</u>
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

A Note on Seasonally Adjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Employment Projections for the 1980's

Subjects include:

The labor force—expected changes in size and composition as a result of the continuing impact of the post-World War II baby boom, the increased participation of women, and the drop in the birth rate during the 1960's.

Gross national product and income—projected trends and major underlying assumptions on fiscal policy, productivity, and other factors affecting aggregate demand.

Industry output and employment—gross product originating in major sectors; employment in 149 industries

Distribution of demand—changing patterns in the major sectors of consumption, business investment, government expenditures, and foreign trade, and in 162 industries.

Four articles from the *Monthly Labor Review* and additional tables project the United States economy to 1990—growth, employment, output, income, and demand over the next decade.
