Producer Price Indexes is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights. A subscription may be ordered for 1 or 2 years from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402.

Annual subscription price:

\$29 a year domestic (includes
supplement)
\$5.25 additional foreign

Single copy \$10; foreign \$12.50

Supplement \$17; foreign \$21.25

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission. Second-class postage paid at Washington, DC and at additional mailing offices.

Price Movements

February 1989

The Producer Price Index for Finished Goods moved up 1.0 percent seasonally adjusted from January to February. The increase was the same as in January and compares with an average monthly rise of 0.3 percent during 1988. Prices received by domestic producers of intermediate goods rose 0.5 percent in February, much less than the 0.9-percent jump recorded a month earlier and the same as December's increase. After climbing more than 3 percent in both December and January, the index for crude goods edged down 0.1 percent. (See table A.)

Among finished goods, consumer food prices advanced sharply for the second consecutive month. The index for energy goods also continued to climb, although not as much as in the previous month. Although price increases slowed for consumer durables and capital equipment, prices for consumer nondurables other than foods and energy rose at a fast rate (about 1 percent) for the second time in the last 3 months.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved up 0.6 percent in February to 111.7 (1982=100).

Over the 12 months ended in February 1989, the Finished Goods Price Index increased 5.3 percent. During this same period, consumer food prices moved up 7.2 percent, the

index for energy goods rose 5.8 percent, consumer goods other than foods and energy were up 5.0 percent, and capital equipment prices increased 3.7 percent. The Intermediate Goods Price Index climbed 6.3 percent from February 1988 to February 1989, while the Crude Goods Price Index was 6.7 percent higher than its level a year ago.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods advanced 1.2 percent seasonally adjusted, about the same as in the previous month. As in January, the foods index registered the same change as the consumer goods index. The February increase of 35.3 percent for fresh vegetables was led by a 158-percent surge for tomatoes. Beef and veal, apples, roasted coffee, soft drinks, fish, pasta, and processed turkeys also advanced, but eggs, dairy products, shortening and cooking oils, and milled rice declined. Pork prices inched up slightly after rising over 11 percent in the previous month.

After advancing 4.9 percent in January, the index for finished energy goods rose 2.4 percent in February. Home heating oil prices turned down somewhat following a sharp rise a month earlier, the index for natural gas moved up much

less than in January, and gasoline prices rose about 4 percent for the second consecutive month.

The index for nonfood nonenergy consumer goods increased 0.7 percent after rising 0.4 percent in the previous month. Prices turned up following January decreases for sanitary papers, cosmetics, tires and tubes, and newspapers, and prices for alcoholic beverages rose 1.7 percent after showing no change a month earlier. Prices rose more rapidly than a month earlier for prescription drugs, footwear, periodicals, and household flatware. Prices for books and sporting goods also continued to rise considerably. In contrast, price increases slowed for passenger cars, women's and men's apparel, over-the-counter drugs, appliances, and home electronic equipment. Prices fell more than in January for floor coverings and gold jewelry, and prices edged down after rising substantially in January for children's apparel and costume jewelry.

Capital equipment. The Producer Price Index for capital equipment rose 0.4 percent in February after rising 0.6 percent in January. Price increases slowed for construction machinery, cars and light trucks, pumps, photographic equipment, transformers, and industrial material handling equipment. Prices turned down after rising a month earlier for integrating and measuring instruments, communication equipment, and printing trades machinery. In contrast, prices turned up in February after falling or showing no change a month earlier for chemical industry machinery, oil field and gas field machinery, x-ray equipment, heavy motor trucks, and railroad equipment. Prices rose more rapidly for agricultural machinery, ships, and paper industries machinery.

Intermediate goods

After climbing 0.9 percent in January, the Producer Price Index for Intermediate Goods slowed to a 0.5-percent rise

in February, the same as in both November and December. The February deceleration was concentrated in energy, foods, and durable manufacturing materials. Prices for many other kinds of intermediate goods continued to increase considerably.

The index for intermediate energy goods moved up 1.4 percent following a 2.9-percent jump in January and a 1.0-percent advance in December. Indexes for diesel fuel and residual fuel, which had each risen about 10 percent in January, moved up about 5 percent in February. While increases in some other intermediate energy goods also slowed down, the rise in liquefied petroleum gas prices was still sharp (7.2 percent).

Following a 2.4-percent advance in the preceding month, the index for intermediate foods and feeds edged down 0.2 percent in February. Much of this downturn was due to lower prices for animal feeds and flour in the wake of January advances. Crude vegetable oils fell for the second consecutive month. In contrast, price increases accelerated for confectionery materials and refined sugar.

The index for intermediate goods other than foods and energy rose 0.5 percent over the month, about the same as in most other recent months. The most notable movement within this broad grouping was the dramatic slowdown in the durable manufacturing materials index; its 0.2-percent rise in February was much less than what was recorded in nearly every other month over the last 2 years. Primary copper prices, which had soared through the second half of 1988, decreased 11.3 percent in February, even more than the 4.6-percent drop in January. Copper and brass mill shapes also fell for the second consecutive month after sharp advances in 1987 and 1988. Prices for precious metals, lead, secondary nonferrous metals, and cement were also lower in February. In contrast, prices for steel mill products, blast and electric furnace products, and zinc advanced more than in January.

The index for nondurable manufacturing materials registered another substantial increase (0.8 percent). February advances were led by industrial chemicals, paper, paint materials, paperboard, woodpulp, and leather.

The Producer Price Index for construction materials rose 0.4 percent over the month, about as much as in most other recent months. Higher prices were recorded for plywood, softwood lumber, millwork, fabricated structural metal products, and paint. However, prices for nonferrous wire and cable declined.

Among other kinds of intermediate industrial goods, increases occurred for paper bags and boxes, commercial printing, photographic supplies, motors and generators, and ball and roller bearings. The index for electronic components, however, turned down.

Crude goods

After climbing 3.9 percent in January, the Producer Price Index for Crude Materials for Further Processing inched down 0.1 percent in February, seasonally adjusted. Price increases slowed for energy, the sensitive industrial materials category showed no change after a substantial January rise, and foodstuff prices turned down following advances in December and January.

The crude energy materials index rose 1.1 percent after climbing 6.7 percent in January. Crude petroleum prices increased 1.2 percent, far less than the advances of more than 12 percent recorded in each of the last 2 months. The increase for the natural gas index also slowed. Coal prices fell, but not as much as in the previous month.

The crude foodstuffs and feedstuffs index fell 1.3 percent after rising 2.2 percent in January. Prices turned down following January increases for hogs, corn, soybeans, cattle, and wheat. Fluid milk prices also dropped. In contrast, fresh vegetable prices soared more than one-third after declining in each of the preceding 4 months. Live turkey prices also advanced steeply in February, following a smaller January

increase. Prices turned up for live chickens, unprocessed fish, and fresh fruits following declines in the preceding month.

The index for crude nonfood materials other than energy remained unchanged after rising 2.2 percent in January. Sizable declines were noted for aluminum base scrap, lead scrap, and gold and silver ores. Copper ores showed a small decrease, and copper base scrap and raw cotton fell moderately. On the other hand, prices rose for ferrous scrap, cattle hides, softwood logs, construction sand and gravel, lead and zinc ores, leaf tobacco, and wastepaper.

Net output price indexes for mining and manufacturing industries

The Producer Price Index for the net output of the domestic manufacturing sector moved up 0.5 percent from January to February. (Net output price indexes are not seasonally adjusted.) This followed a 0.9-percent upward surge in January and a 0.3-percent rise in the month before that. From February 1988 to February 1989, this index increased 5.2 percent. Prices rose much less in February than in January for a broad range of major manufacturing industry groups, including food, tobacco manufactures, chemicals, petroleum refining, technical instruments, and printing and publishing, all of which had jumped at least 1 percent in January. However, price increases accelerated for some industry groups, most notably the lumber and wood products and the paper groups.

After soaring 5.5 percent in January, the index for the net output of total mining industries slowed somewhat to a 1.2-percent advance in February. Over the 12 months ended in February 1989, this index moved up 5.3 percent. The metal mining group index, which had climbed nearly 3 percent in January, dropped 2.1 percent a month later. The oil and gas extraction industry group index decelerated from a 6.9-percent increase in January to a 1.8-percent rise in February.

1/ Indexes in this table are derived from the primary product indexes in table 5 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the economy, excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of the July 1986 issue of Producer Price Indexes.

1/ Indexes in this table are derived from the product indexes in table 5. These indexes are composed of the goods used by the industries in each of the industry stage of process output indexes as shown by the 1977 input/output relationships. These material inputs include only domestic material input and do not include any imported materials which may be used.

2/ All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

3/ Not available.

4/ Percent of final input to consumers.

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,100 commodities and 75,000 quotations per month.

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 5). The commodity structure (table 6) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, and nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extension of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 4 lists indexes for the net output of major mining and manufacturing industry groups at the 2-digit level. Table 5 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classi-

fied in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 5 correspond to 8-digit commodity indexes in table 6. In these cases, movement of the latter indexes are calculated on the basis of movements of their counterparts in table 5. Although most such indexes continue to be published in table 6 on a base period of 1982=100 or some later base, corresponding indexes in table 5 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing

indexes) calculated from traditional commodity groupings, currently reflect 1982 values of shipments as reported in the Census of Manufactures and other sources. From January 1976 through December 1986, PPI weights were derived from 1972 shipment values. Industry indexes, which are based on the SIC system, continue to be calculated with 1977 net output weights.

Effective with publication of January 1988 data, many important PPI series (including all stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100, to coincide with the reference year of shipment weights. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not alter previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

<i>Index Point Change</i>	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
<i>Index Percent change</i>	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034 x 100
Equals percent change	3.4

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1982 or some later month). An increase of 5.5 percent from the reference period in the Finished

Goods Price Index, for example, is shown as 105.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$105.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods today are 10 percent lower than they were in 1982.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 570, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived from the X-11 Seasonal Adjustment

Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January 1983 through December 1987 were replaced at the beginning of 1988. Indexes for most broad commodity groupings and 8-digit individual commodities in table 6, as well as industry and Census product indexes in tables 4 and 5, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 6 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregate method, which combines seasonal movements of the basic stage-of-processing categories with those of a wide variety of food and certain other subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behavior abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.
