Price Movements

March 1982

The Producer Price Index for Finished Goods edged down 0.1 percent from February to March on a seasonally adjusted basis. This followed an identical decline in February and a 0.4 percent rise in January. Prices for intermediate goods moved down 0.3 percent for the second consecutive month. Crude material prices dropped 0.9 percent, somewhat more than the February decrease of 0.6 percent (table A).

Among finished goods, energy prices declined even more than in either January or February, and food prices edged down following increases in each of those months. The index for finished consumer goods other than foods and energy rose 0.2 percent for the second consecutive month. Capital equipment prices, however, turned up after decreasing in February.

During the first quarter of 1982, the Finished Goods Price Index increased at a seasonally adjusted annual rate of 0.6 percent, the slowest quarterly advance for this index since it edged down during the opening 3 months of 1976. The finished energy goods index fell at a rate of 18.5 percent from December 1981 to March 1982, a drop approached only by a 14.2 percent rate of decline in the first quarter of 1976. Price increases for capital equipment and for finished consumer goods other than foods and energy slowed to rates of 2.1 and

3.6 percent, considerably less than in other recent quarters. On the other hand, the index for finished consumer foods moved up at a rate of 5.8 percent. Prices for intermediate goods declined at a 1.2 percent rate in the first 3 months of 1982, the first decrease since the second quarter of 1975. Because of higher foodstuff prices, the crude materials index rose at a rate of 1.0 percent, following sharp declines in each of the final 2 quarters of 1981.

Before seasonal adjustment, the Producer Price Index for Finished Goods decreased 0.2 percent in March to 276.9 (1967 = 100). Over the year, the Finished Goods Price Index was up 4.1 percent. From March 1981 to March 1982, prices for finished consumer foods rose 1.8 percent, finished energy prices fell 2.8 percent, the index for finished consumer goods other than foods and energy advanced 6.0 percent, and capital equipment prices climbed 6.8 percent. The Producer Price Index for intermediate goods was 2.9 percent higher than a year earlier, while crude material prices dropped 4.3 percent.

seasonally adjusted basis, after edging down 0.1 percent in February. The finished energy goods index declined 2.3 percent, the third consecutive monthly decrease and the largest monthly decline in over 6 years. Prices for both gasoline and home heating oil fell more sharply than in the previous month. On the other hand, prices for natural gas rose 2.4 percent after increasing 2.0 percent in February.

The index for finished consumer foods edged down 0.2 percent, after rising 0.5 percent in February and 1.1 percent in January. Price indexes turned down after rising sharply a month earlier for eggs, pork, and dairy products. Prices fell more than in February for fresh fruits and vegetables and for shortening and cooking oils. Whole black pepper fell 9.1 percent after several months of little or no change. Price increases decelerated for roasted coffee, soft drinks, and processed fruits and vegetables. However, prices turned up after falling in February for fish and processed poultry. Beef and veal prices rose more rapidly than in either of the 2 preceding months. Milled rice prices fell but not as much as in February.

The index for finished consumer goods other than foods and energy rose 0.2 percent, the same as in the previous month. Price indexes turned up for both passenger cars and light motor trucks after declining a month earlier. Increases also occurred for apparel, household appliances, alcoholic beverages, pharmaceutical preparations, household flatware, rubber footwear, and cutlery. On the other hand, large declines were registered for gold jewelry, cosmetics, and tires and tubes.

Capital equipment. The Producer Price Index for capital equipment advanced 0.5 percent after moving down 0.4 percent in February. Prices turned up after falling a month earlier for motor vehicles and

photographic equipment. Prices rose somewhat faster than in February for integrating and measuring instruments and for oilfield and gasfield machinery. However, food products machinery prices fell more than a month earlier, and prices for construction equipment and for pumps and compressors edged down after several months of increases. Price advances slowed somewhat for commercial furniture, office and store machinery, transformers, mining machinery, and agricultural machinery.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components fell 0.3 percent in March, seasonally adjusted, the same as in the prior month. The index for intermediate materials other than foods and energy was unchanged for the second consecutive month; its major component categories registered changes nearly the same as those in the previous month.

The index for durable manufacturing materials dropped 0.6 percent. Tin prices plummeted 21.7 percent, after having soared nearly 30 percent from June through February. Silver and gold prices dropped 17.4 and 13.0 percent, respectively. Prices for nearly all other nonferrous metals also fell unusually sharply, and the indexes for jewelers' materials and ferrosilicon continued to recede.

The nondurable manufacturing materials index declined 0.3 percent, as prices fell sharply for plastic resins, finished fabrics, leather, and fertilizer materials. Decreases also occurred for paint materials, gray fabrics, and paperboard. Prices for inedible fats and oils, however, climbed about 2 percent for the second consecutive month.

The construction materials index edged up 0.1 percent. Large increases for plywood, switchgear and

switchboards, refractories, and gypsum products were offset by downward movements for millwork, softwood lumber, and plastic construction products.

In other categories, prices for glass containers, unsupported plastic film, transportation equipment hardware, and machine tool parts rose substantially. In contrast, price reductions were recorded for mixed fertilizers, pesticides, and photographic supplies.

The index for intermediate energy goods moved down 1.1 percent, the second consecutive drop. Prices were considerably lower for gasoline, residual fuel, liquefied petroleum gas, diesel fuel, and kerosene. The electric power index rose sharply for the fourth time in the last 5 months, however.

The intermediate foods and feeds index also declined 1.1 percent. Prices for animal feeds, refined sugar used in food manufacturing, and fats and oils decreased markedly, while the flour index turned up.

Crude materials

The Producer Price Index for Crude Materials for Further Processing fell 0.9 percent on a seasonally adjusted basis, slightly more than the decline in February. Prices for nonfood materials continued to fall, and foodstuffs moved up less than in February.

The index for crude nonfood materials other than energy fell 4.1 percent; this index has decreased at least 2 percent in each of the last 5 months. Prices for ferrous and copper scrap, wastepaper, and potash continued to decline substantially. Cattle hide prices turned down after rising in each of the preceding 2 months. On the other hand, prices turned up for raw cotton and crude natural rubber following February decreases. Prices for logs and timber and for sand and gravel also rose.

The crude energy materials index moved down 1.1 percent, after falling 0.5 percent in February. Prices for crude petroleum declined considerably more than in the previous month, and coal prices turned down following an increase in the previous month. Natural gas prices, however, moved up somewhat more than in February.

The index for crude foodstuffs and feedstuffs edged up 0.2 percent, somewhat less than the 0.7 percent increase in February. Prices for cattle and hogs showed smaller increases than in the preceding month. Prices for oilseeds, which had risen in January and February, fell considerably in March. Prices for raw cane sugar and cocoa beans moved down substantially. In contrast, increases for live poultry accelerated, and wheat and corn prices turned up after falling in the preceding month.

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 89 percent of total finished goods, about 88 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown

reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

² All data are subject to revision 4 months after original publication.

³ Not seasonally adjusted.

¹ Indexes with a commodity point code of .99 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

² Data for November 1981 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

³ Not available.

⁴ Prices for all items in this grouping are lagged 1 month.

⁵ Regional refined petroleum product prices and price indexes are presented in table 7.

⁶ Prices for some items in this grouping are lagged 1 month.

n.e.c. = Not elsewhere classified.

Note: Titles of some commodities are not shown in this table because they fail to meet our publication criteria.

¹ Date for November 1981 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices are lagged 1 month. Data are not seasonally adjusted.

² Caution should be used in interpreting month-to-month changes because of low response rates, which ranged from 30 to 60 percent for these indexes.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton

yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price change by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices

generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed sub-products (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by

establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967=100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry

shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.
