Producer Price Indexes

September 1984

The Producer Price Index for Finished Goods moved down 0.2 percent on a seasonally adjusted basis from August to September. The index had edged down slightly in August as well. Prices received by producers of intermediate goods inched down 0.1 percent, the third consecutive small monthly decrease. Crude material prices declined 0.1 percent, following a much larger fall a month earlier. (See table A.)

Lower prices for foods and energy largely caused the September decline in the Finished Goods Price Index. Food prices fell somewhat more than in August. The index for finished energy goods also continued to drop, although not so much as in either July or August. Prices for finished goods other than foods and energy were unchanged in September, continuing the pattern of widespread price stability during the last year.

Before seasonal adjustment, the Producer Price Index for finished goods decreased 0.7 percent to 289.8 (1967=100). Over the year, the Finished Goods Price Index rose 1.6 percent. During the 12 months ended in September 1984, consumer food prices advanced 4.0 percent, the index for finished energy goods declined 7.4 percent, prices for consumer goods other than foods and energy increased 2.5 percent, and the capital equip-

ment index rose 2.7 percent. The index for intermediate goods was 1.5 percent higher in September 1984 than a year earlier, and crude material prices were down 0.5 percent over the same span.

Finished goods

Finished consumer goods. For the second consecutive month, the Producer Price Index for finished consumer goods moved down 0.2 percent on a seasonally adjusted basis. The index for finished energy goods fell 0.8 percent in September, much less than in either July or August. The natural gas index turned down after rising for 5 consecutive months. Price indexes for gasoline and home heating oil fell much less than in August.

The index for finished consumer foods declined 0.4 percent, after edging down 0.1 percent a month earlier. Prices for fresh vegetables and fish turned down after rising in August, and prices fell after showing little or no change in the previous month for processed fruits and vegetables, beef and veal, and shortening and cooking oils. Prices for pork and eggs continued to fall sharply. On the other hand, prices turned up after falling in August for dairy products and processed poultry. Prices for fresh fruits climbed almost 18 percent,

following a far smaller increase in August. Roasted coffee prices also increased more than a month earlier.

The index for finished consumer goods other than foods and energy was unchanged from August to September. Prices for costume jewelry, color televisions, boats, lawn and garden equipment, and cutlery declined, while publications, apparel, cosmetics, and rubber footwear advanced. A 0.4 percent drop in the index for passenger cars was mostly due to end-of-model-year allowances and other incentives.

Capital equipment. The Producer Price Index for capital equipment showed no change in September, after a 0.3 percent rise in August. Decreases for plastics industry machinery, heavy trucks, and cars offset advances for light trucks, truck trailers, and a few kinds of machinery.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components edged down 0.1 percent seasonally adjusted in September, about the same as in both July and August. The last time this index had declined over the course of a calendar quarter was in the 3 months ended in March 1983.

Continuing its recent downward pattern, the materials for durable manufacturing index fell 1.1 percent in September. Prices moved down for most nonferrous metals (particularly lead), jewelers' materials, and hardwood lumber. Copper prices turned up, however. In the nondurable manufacturing materials category, sizable increases occurred for plastic resins and paperboard; prices for the latter increased 13.5 percent since September 1983, one of the few cases among intermediate goods where prices climbed at a double-digit rate over the last 12 months. These increases were nearly

offset by declines for industrial chemicals, paper, and leather.

Following an increase of a half a percent in August, the construction materials and components index edged up 0.1 percent. Indexes for nonferrous wire and cable and for brass fittings moved down. In contrast, prices for heating equipment, softwood lumber, millwork, and gypsum products advanced. Among other industrial goods, large advances occurred for electronic components, paper boxes and containers, pesticides, pressed and blown glassware, and non-automotive metal stampings. Rubber hose prices turned down, however.

The intermediate energy goods index again declined (0.6 percent), as lower prices for diesel fuel and most other refined petroleum products were partly offset by an upturn in prices for liquefied petroleum gas. Similarly, the intermediate foods and feeds index continued to fall (1.6 percent), as prices for all major components dropped.

Crude goods

The Producer Price Index for Crude Materials for Further Processing edged down 0.1 percent on a seasonally adjusted basis, after falling 1.2 percent in August. The index for crude foodstuffs and feedstuffs remained unchanged, following a 1.8 percent decrease in the previous month. Prices for live poultry climbed 7.4 percent, after plummeting 11.4 percent a month earlier. Advances following August declines were also noted in prices for cattle, corn, raw fish, raw cane sugar, and cocoa beans. The index for fresh fruits rose much faster than in the previous month. In contrast, fresh vegetable and soybean prices moved down sharply after advancing in August, and prices for hogs and hay fell more than in the preceding month. Wheat prices also continued to decline.

The index for crude nonfood materials other than energy rose 1.2 percent, following substantial declines in both July and August. Prices for ferrous scrap, softwood logs, potash, cattle hides, and crude natural rubber turned up, after falling in the previous month. Leaf tobacco prices climbed much more than a month before. On the other hand, prices for wastepaper and for aluminum and copper scrap continued to fall.

Following increases in each of the previous 5 months,

the crude energy goods index moved down 0.8 percent. The September change was led by the natural gas index, which dropped substantially following a sizable advance in August. Monthly movements in the crude energy index have been dominated by natural gas price changes for the last year and a half. Coal prices edged down in September, while crude petroleum prices remained unchanged.

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100,000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 86 percent of total finished goods, about 86 percent of total intermediate materials, and about 97 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP

grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

¹ Indexes with a commodity point code of .99 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

² Data for May 1984 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

³ Not available.

⁴ Prices for all items in this grouping are lagged 1 month.

⁵ Regional refined petroleum product prices and price indexes are presented in table 7.

⁶ Prices for some items in this grouping are lagged 1 month.

⁷ This grouping excludes fabricated wire products, which had been included in the discontinued code 10-13 and which are now grouped in code 10-88.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes, which is undergoing extensive changes, currently contains about 3,200 commodities and about 43,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by class of buyer and by degree of fabrication (i.e., finished goods, intermediate goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and that are ready for sale to the final demand user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components include commodities that have been processed but that require further processing. Examples of such semifinished goods include flour, cotton yarns, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that are purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated and which are not sold directly to consumers. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude non-food materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than broad commodity grouping indexes. Broad commodity grouping indexes sometimes produce exaggerated or misleading signals of price change by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times-once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the broad commodity grouping indexes uses the total shipment values for commodities at all stages of processing. Within the stage-of-processing structure, on the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade

publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In aggregating producer price indexes, price changes for various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars as follows: "The price of a representative sample of finished goods produced in the United States has risen from \$100 in 1967 to \$225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change

Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	<u>1.0</u>

Index Percent Change

Index point change	1.0
divided by previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equal index percent change	0.5

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy,

seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index Revision (PPIR) in table 4, "Producer price indexes for the net output of selected industries and their products." Table 4 includes data for Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1986, table 4 will cover nearly all 493 SIC mining and manufacturing industries.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within the industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in one industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry that are not derived from the sales of their products. Because of the distinction between

primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some PPIR indexes published in table 4 correspond to 8-digit commodities published in table 6. In these cases, movements in the commodity indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in table 6 on their original base period of 1967 = 100 or some later base, corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect,

but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the PPIR program, item weights are based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes. In addition, some

traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

For further information on the underlying concepts and methodology of both the traditional PPI and the PPIR, see Chapter 7, "Producer Prices," in *BLS Handbook of Methods* (1982), Bulletin 2134-1. Reprints are available from the Bureau of Labor Statistics on request.
