Producer Price Indexes is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights. A subscription may be ordered for 1 or 2 years from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402.

Annual subscription price:

\$21 a year domestic (includes
supplement)

\$5.25 additional foreign

Single copy \$8.50; foreign \$10.63

Supplement \$13; foreign \$16.25

Price Movements December 1987

The Producer Price Index for Finished Goods dropped 0.3 percent seasonally adjusted from November to December. During the last quarter of 1987, the index decreased an average of 0.2 percent a month. Prices received by domestic producers of intermediate goods rose 0.2 percent in December, somewhat less than in most other months of 1987. Crude material prices dropped 0.3 percent, the third decline in the last 4 months. (See table A.)

Lower prices for food and energy accounted for most of the December decrease in the Finished Goods Price Index. The index for consumer goods other than foods and energy, however, rose 0.5 percent after 2 months of no change. Capital equipment prices again inched up slightly.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved down 0.4 percent in December to end the year at 296.8 (1967=100).

From December 1986 to December 1987, the Finished Goods Price Index increased 2.2 percent. Since the index declined 2.3 percent during 1986, it now stands at virtually the same level as in December 1985. Finished energy prices climbed 10.2 percent in 1987, in the wake of a 38.0-percent slump a year earlier. Food prices showed almost no net change (down 0.2 percent) from December 1986 to December 1987, after rising 2.9 percent in 1986. The index for other finished

goods rose less in 1987 (2.1 percent) than in the preceding 12 months (2.7 percent), in large part because of a downturn in the motor vehicles price index.

At earlier stages of processing, prices for many materials turned up in 1987 after having fallen in the previous year. The Intermediate Goods Price Index rose 5.6 percent over the year, and the Crude Goods Price Index increased 8.8 percent. As with the Finished Goods Price Index, a partial recovery in energy prices contributed to these turnarounds. In addition, indexes for industrial materials accelerated markedly.

The index for intermediate materials less food and energy advanced 5.3 percent over the year (vs. a 0.1-percent rise in 1986); crude nonfood materials other than energy soared 22.4 percent in 1987 following a 1.7-percent increase the year before.

Finished goods

Finished consumer goods. The price index for finished consumer goods moved down 0.4 percent seasonally adjusted after showing no change in November. In December, food prices turned down 1.3 percent following a 0.3-percent rise the month earlier. Prices for pork fell 12.6 percent, the fifth

substantial drop in the last 6 months, and processed poultry declined even more than in November. Prices for fresh vegetables, which had risen over 40 percent in November, fell 11.0 percent in December, partly because of improved supplies of tomatoes. Prices for eggs, roasted coffee, and fresh fruits also turned down sharply after advancing in the preceding month. Milled rice prices continued to climb, but much less than in either October or November. On the other hand, prices turned up after decreasing in the previous month for bakery products and shortening and cooking oils. Price decreases for beef and fish slowed markedly. Prices for processed fruits and vegetables rose more rapidly than in November.

The index for finished energy goods fell 1.9 percent in December after a decline of 0.8 percent the month earlier. Prices dropped sharply for both gasoline and home heating oil following November advances. In contrast, the index for natural gas rose 3.0 percent, about as much as it had fallen in the previous month.

The index for consumer goods other than foods and energy rose 0.5 percent following 2 months of no change. Price increases accelerated for tobacco products, household furniture, tires and tubes, and sporting and athletic goods. Prices turned up after falling in November for cosmetics, newspapers, apparel, and footwear. Gold jewelry prices rose after showing no change the month earlier. However, passenger car prices fell considerably for the second consecutive month to end the year 3.1 percent below the December 1986 level. Price increases slowed for pharmaceutical preparations and book publishing.

Capital equipment. After inching up 0.1 percent in November, the index for capital equipment rose 0.2 percent in December. Heavy trucks, oil field and gas field machinery, metal cutting machine tools, transformers, and mining machinery and equipment all climbed more than 1 percent

over the month. In contrast, prices fell for automobiles and light motor trucks.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components moved up 0.2 percent seasonally adjusted from November to December following increases of 0.5 and 0.4 percent in October and November. This slowdown largely resulted from a downturn in energy prices. However, metal prices continued to advance rapidly.

After rising 0.6 percent the month before, the intermediate energy index fell 1.6 percent. Prices turned down substantially for gasoline, diesel fuel, residual fuel, jet fuel, and liquefied petroleum gas. In contrast, the index for electric power rose after declining in 3 of the 4 most recent months.

Another sizable advance (0.6 percent) was recorded for the index for intermediate goods other than foods and energy. Once again, the durable manufacturing materials category led the upward movements, rising 2.1 percent for the month and 11.6 percent for the year. Primary copper prices surged nearly 20 percent in December, to end the year 86.1 percent higher than in December 1986, a record 12-month jump for copper. Copper prices had fallen during most of the 1980's. Among other items showing notable increases in December were steel mill products, zinc, and precious metals.

Recent metal price increases in turn contributed heavily to the 0.6-percent advance in the construction materials and components index. Prices for nonferrous wire and cable rose an unusually large amount (9.3 percent). In addition, large increases took place for fabricated structural metal products. On the other hand, prices decreased for softwood lumber, plywood, and plastic construction products.

The nondurable manufacturing materials category displayed more moderation compared to other recent months, moving up only 0.2 percent. Lower petroleum input prices

were partly responsible for this slowdown. Prices for plastic resins and paint materials turned down after rising sharply in October and registering minor increases in November. In addition, industrial chemicals and synthetic rubber rose much less than in other recent months. Price advances accelerated, however, for paperboard and leather.

Among other intermediate goods, prices rose sharply for commercial printing and metal fasteners, while aluminum beverage can prices fell. The intermediate foods and feeds index moved up 0.4 percent, as higher prices for prepared animal feeds and crude vegetable oils were partly offset by declines for corn sweeteners.

Crude goods

After showing a 1.7-percent drop in November, the decline for the Producer Price Index for Crude Materials for Further Processing slowed to 0.3 percent in December, seasonally adjusted. Price decreases for livestock were smaller, and prices for natural gas and feedstuffs turned up following declines in November.

The index for crude foodstuffs and feedstuffs advanced 1.3 percent in December following a 3.0-percent drop the month earlier. For the year as a whole, this index moved up 1.7 percent; double-digit increases for cattle, soybeans, corn, and wheat were largely balanced by declines of nearly 25 percent for the hog and live poultry indexes. In the month of December, price decreases slowed for hogs, cattle, and chickens. Prices turned up for soybeans, wheat, corn, unprocessed fish, and lambs following November declines. Turkey prices surged 40.4 percent in December, the largest single monthly increase on record. In contrast, fresh vegetable prices turned down somewhat following an unusually large advance in November. Fresh fruit prices also turned down, and fluid milk fell more than in the previous month.

The index for crude nonfood materials decreased 1.4 percent following a 0.8-percent decline in November. This grouping advanced 13.9 percent during the 12 months ending in December 1987; the crude petroleum index was up 29.1 percent for the year, iron and steel scrap prices jumped 41.0 percent, and nonferrous scrap soared 50.2 percent. For the month of December, declines of about 5 percent were noted for crude petroleum, ferrous scrap, and raw cotton. In contrast, there were moderate advances for natural gas, softwood logs, nonferrous metal ores, and leaf tobacco. Substantial increases were recorded for both copper and aluminum base scrap.

Net output price indexes for major industry groups

After edging up 0.1 percent in November, the Producer Price Index for the net output of the domestic manufacturing sector inched down by the same amount in December. (Net output price indexes are not seasonally adjusted.) The index for the net output of the petroleum refining industry group, which had advanced 1.4 percent in November, retreated 4.8 percent in December. In addition, the transportation equipment industry group index fell 0.9 percent following a 0.6-percent decrease in November. These were balanced by substantial increases for tobacco manufactures (3.7 percent), primary metal industries (2.6 percent), and leather industries (1.2 percent). From December 1986 to December 1987, the price index for the net output of total manufacturing industries rose 3.9 percent.

Prices received for the net output of the domestic mining sector moved up 0.1 percent over the month after four consecutive monthly declines. Over the year ended in December 1987, this index increased 4.1 percent. The December upturn was led by the metal mining industry group, which climbed 1.0 percent after decreasing 1.1 percent in November.

Price Highlights, 1987

Craig Howell, Andrew Clem, and Roger Burns

Prices received by domestic producers turned up across a broad front during 1987. The Finished Goods Price Index increased 2.2 percent from December 1986 to December 1987 following a 2.3-percent decline in 1986 and a 1.8-percent advance in 1985. The index level in December 1987 was almost the same as it had been in December 1985. In the wake of a 4.4-percent drop in 1986 and a very small decline the year before that, prices for intermediate goods moved up 5.6 percent in 1987. In contrast to substantial decreases in 1986 (9.0 percent) and 1985 (5.6 percent), the Crude Goods Price Index climbed 8.8 percent in 1987.

Energy prices, which had spearheaded the 1986 declines, rebounded somewhat in 1987 and thereby contributed to the upturn at each stage of processing. Food price index movements were generally moderate. The behavior of price indexes for nonfood, nonenergy goods was mixed. Among crude materials, prices for sensitive industrial materials surged 22.4 percent. Prices for intermediate industrial materials advanced 5.3 percent after 2 years of virtually no change. Yet prices of finished goods other than foods and energy rose only 2.1 percent, even less than in either 1985 or 1986, in large part because of a downturn in motor vehicle prices.

The general economic expansion that had begun when the most recent recession ended in late 1982 completed its fifth year in 1987, but with some signs of faltering. Consumer expenditures, which had fueled the recovery for some time, weakened as the year progressed, resulting in some unwanted inventory accumulation by retailers. Business expenditures on capital goods generally enjoyed another good year in the wake of some broad changes in tax laws affecting investment spending enacted in 1986, but also exhibited some weakness. Residential housing construction was somewhat lower than in other recent years, in part because of a moderate climb in mortgage interest rates. The sharp drop in stock market values in October, while further heightening concern about the durability of the expansion, had not in itself seemed to restrict either consumer or capital goods demand substantially by the end of 1987.

As in other recent years, developments in international currency and trade markets during 1987 had a complex effect on the American economy and the behavior of domestic producer prices. The value of U.S. currency fell rapidly through most of the year, thereby tending both to lower prices

of American goods sold in other countries and to raise prices of imported goods purchased in this country. Significantly improved export demand for many kinds of U.S. products was a major factor in propelling the capacity utilization rate in the manufacturing sector to its highest level since the early 1980's and in pushing the unemployment rate down even lower than it had been. At the same time, higher prices for foreign-made goods generally failed to dampen consumer demand for imported products with a reputation for value and quality.

But despite rising exports and higher prices of competitive imported goods, domestic producers of many finished goods did not raise their own output prices very much, in part because they hoped to keep or recapture a greater market share. For similar reasons, some output prices did not seem to reflect the full passthrough of higher costs for materials, whether domestic or imported.

Finished goods

Energy. After slumping 38.0 percent in 1986, the index for finished energy goods recovered somewhat with a 10.2-percent advance in 1987. This reflected a similar upturn in crude petroleum prices in both domestic and world markets. Price indexes for gasoline and home heating oil each climbed more than 20 percent following declines approaching 50 percent the year before. Natural gas did not share in the 1987 price resurgence, however, falling about 4 percent in the wake of a 16.7-percent decrease in 1986 and a 7.8-percent drop in 1985.

Other consumer goods. Prices received by domestic producers of consumer goods other than foods and energy moved up 2.6 percent from December 1986 through December 1987 following a 3.0-percent increase the year earlier. This index would have accelerated somewhat had it not been for a downturn in the passenger cars index. Prices for a number of items tended to rise more rapidly in the latter half of the year than in the earlier half.

The new car price index dropped 3.1 percent in 1987, in contrast to its 6.5-percent climb in 1986. Imports commanded more than 30 percent of the new car market; in contrast, sales of domestic automobiles retreated somewhat after several strong years. Car sales had been unusually brisk in the second half of 1986, because of both attractive factory-subsidized finance programs and changes in Federal income

Craig Howell, Andrew Clem, and Roger Burns are economists in the Division of Industrial Prices and Price Indexes, Bureau of Labor Statistics

tax laws scheduled to take effect in 1987. But as a result of this, demand for cars was sluggish in early 1987, and incentive programs later in the year had to be generous to hold down dealer inventories. Even with higher prices of many foreign-made models because of the reduced value of the dollar, and with escalating costs of some crucial material inputs such as copper and plastics, American car manufacturers minimized their own price increases to improve their competitive stance.

Prices for prescription and over-the-counter pharmaceutical preparations continued to advance rapidly in 1987 (9.3 and 4.8 percent); these increases were partly attributable to the continued substantial rise in research and development costs associated with bringing new drugs onto the market. Increases in gold and silver were reflected in higher prices for precious metal jewelry. The index for tobacco products also moved up sharply, partly to respond to stronger export demand but also to boost profit margins in the face of several years of falling domestic sales. Increased costs for stainless steel and silver contributed to the substantial advance in household flatware prices. Producer prices for many kinds of apparel rose more than in 1986, although most of the 1987 advances were still modest.

Capital equipment. The Producer Price Index for capital equipment edged up 1.3 percent for the 12 months ended in December 1987 following a 2.1-percent rise in 1986 and a 2.7-percent increase in 1985. As with consumer goods, indexes for motor vehicles played a key role in restraining inflation in the capital goods sector in 1987. Prices received by manufacturers of heavy trucks dropped 2.7 percent after a 3.3-percent advance the year before, while the light trucks index dropped by 0.5 percent compared to a 3.7-percent advance in 1986. Prices for most other kinds of capital equipment rose less than 4 percent in 1987; however, some of these prices tended to accelerate at the end of the year in reaction to much-improved export demand.

Capital spending in 1987, as in most other recent years, was concentrated on equipment that would cut costs and enhance productivity rather than on large-scale capacity expansion projects. While this strategy limited the vulnerability of firms to future recessions, it also limited the ability of producers to respond to increased domestic or foreign demand without encountering capacity restraints and having to boost prices as a result.

Foods. The Producer Price Index for finished consumer foods inched down 0.2 percent in 1987 following a 2.9-percent advance for 1986. As often happens, however, there was a wide variation in price behavior among the items within this category. Substantial decreases for pork, processed poultry, roasted coffee, and eggs balanced climbs for fish, fresh and dried vegetables, shortening and cooking oils, and milled rice. Indexes for most other major foods rose less than 5 percent.

Pork and processed poultry prices fell during most months of 1987, principally because of significant increases in supplies. Beef and veal index movements were more mixed, as strong advances in the first half were partially offset by later declines, resulting in a modest increase for the year as a whole. Fish prices, however, were 18.1 percent higher at the end of 1987 than they had been a year earlier, in part because of the continuing shift towards fish as an alternative to red meats. Seafood consumption reached an all-time high during the year.

Lettuce prices more than doubled, primarily as a result of extensive damage to California crops from the white fly virus late in the year. Bad weather contributed to price increases for tomatoes, citrus fruits, and milled rice. Higher costs for ingredients, including grains, soybeans, and sugar, were passed through in increases for such foods as shortening and cooking oils, bakery products, confectionery end products, and soft drinks. In contrast, excess supplies and sluggish retail demand resulted in considerably lower prices for roasted coffee and eggs.

Intermediate goods

The PPI for Intermediate Materials, Supplies, and Components advanced 5.6 percent during 1987, more than recovering the 4.4-percent decline experienced in the previous year. Although this upturn in prices was most pronounced within the intermediate energy category, the same pattern was observed for a number of other industrial goods, particularly metals and petroleum-derived products.

Manufacturing materials. After showing virtually no net change over the 2 preceding years, the index for intermediate goods other than foods and energy advanced 5.3 percent in 1987. The strongest upsurge was centered in the materials for durable manufacturing category, which climbed 11.6 percent after 3 consecutive years of small declines. Unusually large increases occurred for certain nonferrous metals, and steel prices turned up moderately. According to Federal Reserve Board data, the rate of capacity utilization in the primary metals sector surged from 72 percent to 88 percent between December 1986 and December 1987.

Primary copper prices jumped 86 percent, more than in any other year since indexes for this commodity were first calculated in 1947. Because of a long-term decline in demand for copper (due in part to the replacement of copper wire by fiber optics and the substitution of plastic for copper pipes) and excess production by some Third World countries, copper prices had fallen in 6 of the 7 preceding years. This led to a severe contraction and restructuring of the copper industry in the United States and overseas, which lowered output, in turn setting the stage for an upturn in prices. Demand for copper was stronger than expected throughout 1987; by the end of the year, short supplies resulted in sharp price increases. Copper and brass mill shape prices rose 55 percent for the year as a whole.

Similarly, aluminum prices advanced sharply during the year; unalloyed primary aluminum advanced 33 percent, while aluminum mill shape prices rose 14 percent. As with copper, price decreases in recent years had led producers to cut back their output. Heightened speculative interest in aluminum contributed to the volatility experienced during 1987.

Lead prices rose 49 percent, even more than in the year before. The jump resulted from strong nonautomotive demand, a strike in a Canadian lead-zinc smelter, and production problems elsewhere. Gold and silver price increases of about 30 percent reflected renewed speculative and precautionary demand by investors responding to the drop in the exchange value of the U.S. dollar.

Following a 4.2-percent decline in 1986 and a small dip in the year before that, the PPI for steel mill products moved up 6.4 percent. Sizable increases were noted for all major categories of steel except wire and cold finished bars. Having undergone extensive plant modernization and closings of obsolescent furnaces and mills in recent years, the American steel industry emerged in a stronger competitive position vis-a-vis producers in other countries. For example, a majority of the steel produced in this country is now made in mills with continuous casters, compared to less than 30 percent 5 years ago. Such productivity-enhancing measures plus the decline in the value of the dollar helped to regain part of the market share from foreign producers and restored profitability to the industry. Among other durable materials, hardwood lumber prices advanced 9.0 percent, reflecting the strong demand from Europe and Japan.

After moving down about 2 percent in both 1985 and 1986, the index for materials for nondurable manufacturing advanced 7.7 percent. A major portion of this increase resulted from petrochemicals and derivative products. In the wake of the sharp oil price increases early in the year, prices for benzene and toluene advanced sharply until June, and propylene continued to rise throughout the year. The PPI for basic organic chemicals ended the year 11.7 percent higher than in December 1986, reflecting rises in oil costs, while inorganic chemical prices showed little change.

Petrochemical-derived products likewise began to move up, particularly during the second quarter. Plastic resins prices climbed 14.4 percent over the year, and synthetic rubber advanced 24 percent; both had declined during the two previous years. However, the increase in petrochemical-derived products had comparatively little effect on synthetic fibers, whose prices turned up a modest 1.9 percent after 5 consecutive years of decrease. The continued trend in consumer preferences for clothing made from natural fibers contributed to price increases in cotton and wool yarns and fabrics. Aided by restrictions on textile imports, the American textile industry was operating at about 93 percent of capacity at the end of the year, versus 90 percent in December 1986.

Much like textiles, the pulp and paper products industry operated at over 90 percent of capacity for the entire year,

resulting in significant increases for the second consecutive year. Paper manufacturers in this country and abroad have been reluctant to raise capacity in recent years, leading to higher prices in reaction to improved demand as production limits are reached. Woodpulp prices rose 16.1 percent, almost as much as in 1986. Newsprint and paperboard prices also advanced more than 10 percent, while other grades of paper continued to move up modestly.

Domestic and export demand for leather was strong during 1987, and supplies of hides became scarce. As a result, prices for leather advanced 20 percent. Double-digit increases also occurred for both phosphates and inedible fats and oils following declines in recent years.

Construction materials. Although new residential construction activity continued to recede gradually during the year, prices for several types of materials showed substantial increases. During the spring, mortgage interest rates began to jump because of Federal policy moves to bolster the exchange rate of the U.S. dollar. The rate of new private housing units started declined from about 1.8 million units at the beginning of the year to about 1.4 million at the end. However, most of this reduction came from the multiunit segment of the market (which was adversely affected by the new tax law), while single-family housing starts were only slightly below year-earlier levels. On the other hand, nonresidential construction spending turned up slightly after a sharp drop in the previous year.

The PPI for materials and components for construction rose 4.2 percent following 3 years of smaller increases. Softwood lumber prices, led by large increases for southern pine, advanced 6.8 percent, slightly more than in the year before. Since the slowdown in new housing starts was centered in multiunit structures where less lumber is used per unit, lumber markets were rather stable through most of the year. Strength in the home repair sector, construction of larger homes, and the popularity of such amenities as wood sun-decks boosted lumber prices. Prices for both plywood and millwork advanced moderately.

Reduced supplies of copper and aluminum contributed to the 21.7-percent jump in the index for nonferrous wire and cable, the biggest annual increase since 1979. Higher costs for resins caused the plastic construction products index to climb 8.4 percent, erasing the drops of the 2 previous years.

In contrast, price movements for nonmetallic minerals were very moderate over the course of the year. The exception was gypsum, whose product prices fell 10.6 percent after a small decline in the previous year. Prices for concrete products and insulation materials continued to be very stable. Small upturns occurred for refractories, asphalt roofing, and asphalt paving mixtures.

Energy. In the wake of the record 29-percent drop of 1986, the index for intermediate energy goods rose 9.5 percent; this index was still more than one-quarter below its peak level in 1981. Most refined petroleum fuels had fallen nearly 50

percent during the prior year, while the magnitudes of their increases for 1987 were somewhat more varied.

Prices for jet fuel, which usually are relatively stable compared to other energy sources, soared more than any other intermediate energy index in 1947 (over 40 percent). Number 2 diesel fuel and residual fuel prices climbed nearly 30 percent, while liquefied petroleum gas prices rose about 25 percent. Prices for electric power declined slightly (as in 1986), reflecting lower costs for coal and natural gas used for power generation.

Foods. The intermediate foods and feeds index rose 5.3 percent, the first over-the-year increase since 1983. Prices for crude vegetable oils jumped 21.1 percent because of strong export demand. Similarly, demand from foreign and domestic sources led to a 13.3-percent rise in the prepared animal feeds index. Prices for most materials used in food manufacturing were generally stable.

Crude goods

Following decreases in each year from 1984 through 1986, the Producer Price Index for Crude Materials for Further Processing rose 8.8 percent during 1987. The category for basic industrial materials showed a record advance for 1987. Crude oil prices turned up substantially after falling in recent years, and scrap metals and other items surged at double-digit rates.

Basic industrial materials. The index for crude nonfood materials other than energy advanced 22.4 percent, much more than the 1.7-percent increase of 1986, and the largest annual advance recorded since this index was first compiled in 1973. Prices for all varieties of scrap metal soared at double-digit rates. Production cutbacks in recent years for steel, aluminum, and copper had led to low inventories for scrap metal (scrap, in part, is generated as a byproduct of metal production); increased demand for metals during 1987 then drew up the demand for scrap. Iron and steel scrap advanced 41.0 percent following a modest increase in 1986; in addition to the general causes just described, the falling U.S. dollar boosted exports for ferrous scrap. Aluminum base scrap surged 52.9 percent, and copper base scrap jumped 60.1 percent, each following a much smaller increase in 1986. Lead scrap advanced 61.5 percent.

Prices for logs and timber and for raw cotton turned up sharply following declines in 1986. Logging operations were hindered by inclement weather, thus reducing supplies, and lumber demand associated with residential housing rose. Changes in the cotton subsidization program in 1986 brought U. S. cotton prices closer to the world trading price; once this occurred, domestic producers took advantage of the low-

er American dollar to raise their export sales. A large U.S. cotton crop helped offset lower harvests in other cotton-producing nations, allowing this country to become a more active player in the world market at competitive prices.

Leaf tobacco prices also moved up after falling in the previous year; smaller stocks carried over from the 1986 crop made for lower supplies despite slightly higher production. Cattle hide prices showed stronger advances than in the previous year; domestic demand for leather goods was up, demand from the Far East for cattle hides increased, and world supplies decreased in accord with lowered cattle slaughter rates. Prices also rose for phosphates and domestic apparel wool. Price advances slowed for wastepaper, nonferrous metal ores, and construction sand and gravel, however, compared to the previous year.

Energy. The crude energy materials index moved up 10.5 percent following a 27.5-percent drop in 1986. Crude petroleum prices jumped 29.1 percent after plummeting 50.6 percent in 1986. U.S. production continued to decline in 1987, and imports won an increased share of domestic consumption. Prices surged in the early part of the year after the members of the Organization of Petroleum Exporting Countries (OPEC) set a new policy of lower production and higher prices at their December 1986 meeting. Their aggregate output quota was cut from 17 million barrels per day to 15.8 million, and the U.S. Producer Price Index for crude oil jumped 19.9 percent for the month of January alone. The effectiveness of the OPEC agreement was short-lived, however. By August, estimates showed that OPEC's total output had reached 20 million barrels per day, and prices weakened towards the end of the year. The December 1987 meeting of OPEC members schieved little substantive success, contributing to the prospect of a further drop in prices in early 1988.

The index for natural gas dropped 4.1 percent following more sizable declines in 1985 and 1986. Gas consumers continued to switch to refined petroleum products. Prices for coal moved down nearly 5 percent, considerably more than in either of the 2 preceding years.

Foodstuffs. The index for crude foodstuffs and feedstuffs moved up 1.7 percent after decreasing 1.4 percent in 1986. Cattle prices advanced 11.3 percent, prompted by short supplies. A smaller world crop, together with greater exports, pushed soybean prices up. Grain prices were pulled up by higher export demand, particularly from the Soviet Union. Supply problems, due in part to weather, resulted in higher prices for hay, fresh vegetables, and citrus fruits. Prices for unprocessed fish were up substantially, while raw cane sugar showed a small increase. In contrast, expanded production prompted price declines of 24.7 percent for hogs and 30.3 percent for chickens. Fluid milk prices also declined.

Producer Price Indexes Will Shift to New Reference Base in 1988

Beginning with the release of data for January 1988 in February, many important Producer Price Indexes will shift to a new reference base year, 1982=100. This base change was reviewed by the Office of Federal Statistical Policy and Standards, Office of Management and Budget, and is in keeping with its longstanding policy to update index bases periodically. Indexes for stage-of-processing groupings, commodity groups and individual items, and durability-of-product groupings will shift to the 1982=100 base if they are currently expressed on a base of 1967=100, or on any other base through December 1981. Indexes with a base later than December 1981, as well as indexes for the net output of industries and their products, will remain on their present bases.

The year 1982 coincides with the reference year of the shipment weights, which have been taken primarily from the 1982 Census of Manufactures. The last rebasing of PPI data

occurred in February 1971, when the current 1967 base was substituted for the former 1957-59 base. Historical data for each affected PPI series on the new base will be available from the Bureau of Labor Statistics. Except for rounding differences, the shift to a new reference base will not cause any corrections to previously published percent changes for affected PPI series.

Indexes on the current base will continue to be published in the PPI news release and monthly detailed report *Producer Price Indexes* through December 1987. After that time, BLS will make rebasing factors available to allow data users to calculate for themselves what the indexes would have been on the earlier reference base period.

Because of rounding differences, dividing data on a 1967=100 base by the published 1982 annual averages may not duplicate the official rebased series.

1/ Indexes in this table are derived from the primary product indexes in table 5 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the economy, excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of the July 1986 issue of Producer Price Indexes.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,100 commodities and 75,000 quotations per month.

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 5). The commodity structure (table 6) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or a business firm. Consumer foods include unprocessed foods, such as eggs and fresh vegetables, as well as processed foods, such as bakery products and meats. Other finished consumer goods include durable goods, such as automobiles, household furniture, and appliances, and nondurable goods, such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that are purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extensions of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 4 lists indexes for the net output of major mining and manufacturing industry groups at the 2-digit level. Table 5 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Industries may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by

establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from the sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 5 correspond to 8-digit commodity indexes in table 6. In these cases, movements in the latter indexes are calculated on the basis of the movements of their counterparts in table 5. Although most such indexes continue to be published in table 6 on their original base period of 1967 = 100 or some later base, corresponding indexes in table 5 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported monthly by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are always provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently cor-

rect this weakness at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing indexes) calculated from traditional commodity groupings, currently reflect 1982 values of shipments as reported in the Census of Manufactures and other sources. From January 1976 through December 1986, PPI weights were derived from 1972 shipment values. Industry indexes, which are based on the SIC system, continue to be calculated with 1977 net output weights.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 7, "Producer Prices," in *BLS Handbook of Methods* (1982), Bulletin 2134-1. Reprints are available from the Bureau of Labor Statistics on request (202 523-1221).

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	288.5
Less previous index	285.0
Equals index point change	3.5
Index Percent Change	
Index point change	3.5
Divided by previous index	285.0
Equals	0.012
Result multiplied by 100	0.012 x 100
Equals index percent change	1.2

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1967 or some later period). An increase of 188.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 288.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1967 to \$288.50 today." Likewise, a current index of 300.0 would indicate that prices received by producers of finished goods today are triple what they were in 1967.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data usually are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. Seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchase agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 570, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived by the X-11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January 1981 through December 1985 were replaced at the beginning of 1986. Indexes for most broad commodity groupings

and 8-digit individual commodities in table 6, as well as industry and Census product indexes in tables 4 and 5, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 6 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregative method, which combines seasonal movements from the basic stage-of-processing categories and from a wide variety of food subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behavior abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.
