Price Movements

May 1980

The Producer Price Index for Finished Goods moved up 0.3 percent from April to May on a seasonally adjusted basis. This was somewhat less than the 0.5 percent rise in April and was the smallest increase since a 0.2 percent rise in September 1977. Prices for intermediate (semifinished) goods were 0.4 percent higher, the third consecutive monthly advance of half a percent or less. Crude material prices climbed 1.3 percent after declining substantially in both March and April (table A).

Among finished goods, the capital equipment index showed no change, following a large April advance. Energy prices rose 0.8 percent, far less than in any recent month. Food prices edged up 0.1 percent after falling sharply in April. Prices for finished consumer goods other than foods and energy increased 0.4 percent, somewhat less than in the previous month (table B).

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 0.4 percent to 241.0 (1967=100).

Over the year, the Finished Goods Price Index advanced 13.3 percent. From May 1979 to May 1980, finished energy prices climbed 74.3 percent, consumer food prices rose 1.5 percent, the index for finished consumer goods other than foods and energy increased 11.0 percent, and capital equipment prices advanced 9.7 percent. The Producer Price Index for intermediate goods was 15.8 percent higher than a year ago, and crude material prices were up 6.5 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods moved up 0.4 percent in May on a seasonally adjusted basis after showing no change in April. The index for finished foods moved up 0.1 percent, following a 2.8 percent decrease in April. Prices for beef and veal and pork continued to decline, although considerably less than in the preceding month, and processed poultry

try prices turned up after dropping in April. Prices for refined sugar in consumer size packages climbed 33.4 percent, following a decline in the previous month, and fresh and dried vegetable prices rose about 20 percent after edging up slightly in April. Increases were also registered in May for fresh fruits, dairy products, eggs, flour base mixes and doughs, and packaged cocoa. In contrast, roasted coffee prices fell for the sixth consecutive month. Declines were also recorded for whole black pepper, fish, milled rice, and vegetable oil end products.

Prices for energy goods rose 0.8 percent in May, much less than in any month since September 1978. Gasoline prices were up only 0.4 percent, compared with an increase of 4.3 percent in April, and prices for home heating oil advanced 1.1 percent, following a rise of 3.0 percent in the previous month.

The index for finished consumer goods less foods and energy rose 0.4 percent after a 0.6 percent increase in April. Prices for passenger cars, silver jewelry, and costume jewelry turned down after increasing a month earlier. Prices for cosmetics, household furniture, mobile homes, and disposable plastic dinnerware and tableware advanced less than in the previous month. On the other hand, prices increased more than in April for nonalcoholic beverages, tobacco products, sanitary papers and health products, and household appliances. Prices for gold jewelry and tires and tubes turned up after declining for 2 consecutive months. Prices for household flatware fell but much less

than in April. Apparel prices rose about as much as in each of the 2 preceding months.

Capital equipment. The index for capital equipment was unchanged from April to May, after rising 1.9 percent in April. Prices for motor vehicles and metal forming machine tools turned down after increasing in the previous month. Substantially smaller increases were registered for many other capital goods, particularly plastic and rubber industry machinery, food products machinery, generators, oilfield machinery, construction machinery, and photographic equipment.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components rose 0.4 percent from April to May on a seasonally adjusted basis, the third consecutive moderate increase following advances of 1 percent or more during nearly all of 1979 and early 1980. The rate of advance for most kinds of intermediate goods continued to slow down. However, prices for foods and feeds were sharply higher.

The intermediate energy index edged up 0.1 percent, following a 0.9 percent rise in April and much larger advances in each of the previous 13 months. Residual fuel prices fell substantially for the second consecutive month, and the rate of increase slowed for commercial jet fuel, diesel fuel, and lubricating oil materials. On the other

hand, electric power rates increased more than in April, and liquefied petroleum gas prices turned up after edging down the month before.

The index for intermediate materials less foods and energy also rose 0.1 percent, slightly less than in either of the 2 previous months. The durable manufacturing materials category declined for the third consecutive month, as lower prices were registered for copper, silver, lead, zinc, tin, hardwood lumber, and plastic parts. In contrast, primary aluminum prices continued to rise sharply.

The construction materials index edged down 0.1 percent, following a similar decrease in April. Prices fell for nonferrous wire and cable, millwork, softwood lumber, gypsum products, clay tile, and asphalt roofing. However, large increases were recorded for plywood, concrete products, prepared paint, building paper and board, wiring devices, and plumbing fixtures.

The index for manufacturing components rose 0.3 percent, much less than in any recent month. Prices rose much less than in April for a broad range of items, particularly electronic components, locks, internal combustion engines, and ball and roller bearings. Switchgear and switchboard prices declined after several months of large increases.

The nondurable manufacturing materials index advanced 1.0 percent, following a 1.5 percent boost in April. Price increases slowed for several items, including wood-pulp, plastic resins, synthetic rubber, and processed yarns and threads. Prices turned down for gray fabrics and phosphates, and the indexes for leather and inedible fats and oils both declined for the fourth consecutive month. On the other hand, price increases accelerated for industrial chemicals, synthetic fibers, paper, and paperboard.

Among other intermediate nonfood nonenergy goods, prices fell for photographic supplies, metal forming machine tool parts, and wooden pallets. Prices rose less than in the previous month for mining machinery parts,

metal cutting machine tool parts, abrasive products, paper boxes and containers, and mixed fertilizers.

The intermediate foods and feeds index climbed 6.1 percent, following sizable decreases in March and April. The upturn in May was due in large part to a 25 percent advance in prices for refined sugar used in food manufacturing. Feed prices turned up after a sharp drop in April. Prices also rose after declining in the previous month for flour, crude vegetable oils, and animal fats and oils. Corn syrup prices continued to move up, but not as much as in April.

Crude materials

The Producer Price Index for crude materials for further processing increased 1.3 percent in May on a seasonally adjusted basis, following a 3.5 percent decrease in April. Foodstuff prices turned up after falling for 2 months, crude energy material prices continued to rise, but prices for other materials fell for the third consecutive month.

The index for crude foodstuffs and feedstuffs increased 2.4 percent in May, in contrast to a decrease of 6.1 percent in the previous month. Prices for raw cane sugar jumped 42.5 percent after climbing 16 percent in April. Prices for grains, green coffee, and soybeans turned up after falling in the previous month. Prices for livestock, live poultry, and cocoa beans moved down but not as much as in April.

Prices for crude energy materials rose 1.6 percent, slightly less than the 2.1 percent advance in April. Natural gas prices increased about as much as in the previous month, but crude petroleum prices rose less.

The index for crude nonfood materials less energy declined 2.7 percent. This index had decreased about 5 percent in each of the 2 preceding months. Prices for iron and steel scrap, aluminum base scrap, and hides and skins all fell more than 10 percent. Wastepaper prices declined substantially after rising sharply in April. Crude natural rubber prices dropped for the third consecutive month. Cotton prices increased but not as much as in the preceding month.

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 88 percent of total intermediate materials, and about 98 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For

example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

² All data are subject to revision 4 months after original publication.

³ Not seasonally adjusted.

⁴ Not available.

NOTE: Relative importance figures have been revised to reflect revisions in December 1979 indexes.

¹ Industry and product class indexes may include products not shown separately.

² Data for January 1980 have been revised to reflect the availability of late reports and corrections by respondents. In addition, indexes based on December 1979 = 100 have been corrected for January, February, and March 1980 because of revisions in December 1979 prices; these indexes are still subject to revision on the normal schedule. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

³ Not available.

⁴ Seasonal product—no price available this month.

⁵ Detailed product indexes for industries 2075, 2711, 3272, and 3633 are no longer based on December 1977 = 100. The new base, December 1979 = 100, is consistent with the base of the higher level indexes.

NOTE: Indexes in this table are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

¹ Indexes with a commodity point code of .00 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

² Data for January 1980 have been revised to reflect the availability of late reports and corrections by respondents. Data are not seasonally adjusted.

³ Seasonal commodity—no price available this month.

⁴ Some of the titles of the individual commodity price indexes included in this grouping are not shown.

⁵ Not available.

⁶ Prices for some items in this grouping are lagged 1 month.

⁷ Regional price indexes for bituminous coal, industrial sizes, contract are presented in table 8 of this report.

⁸ Prices for natural gas (05-31) are lagged 1 month.

⁹ Includes only domestic production. Some prices are lagged 1 month.

¹⁰ Prices for gasoline (05-71), light distillate (05-72), middle distillate (05-73), and residual fuels (05-74) are lagged 1 month.

¹¹ Regional refined petroleum product prices and price indexes are presented in table 7 of this report.

¹² Some prices for industrial chemicals (06-1) are lagged 1 month. N.E.C. Not elsewhere classified.

¹ Data for January 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices are lagged 1 month. Data are not seasonally adjusted.

² Caution should be used in interpreting month-to-month changes because of low response rates, which ranged from 30 to 60 percent for these indexes.

³ The figure shown for each item is its percent of total railroad freight.

⁴ Dec. 1978 = 100.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have

not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed

data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
Index Percent Change	
Index point change	<u>1.0</u>
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical

trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed sub-products (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index

for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding Indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967=100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices*

at the time of shipment to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.
