Price Movements

August 1980

The Producer Price Index for Finished Goods moved up 1.5 percent from July to August on a seasonally adjusted basis. This followed a 1.7 percent increase in July. Prices for intermediate (semifinished) goods moved up 1.0 percent, after rising 0.8 percent in both June and July. Crude material prices jumped 5.7 percent, the second consecutive steep monthly rise (table A).

Nearly two-thirds of the August movement in the Finished Goods Price Index was caused by a 4.4 percent climb in food prices, an even sharper advance than in July. In contrast, price increases moderated somewhat for finished goods other than foods, reflecting slower rises for both capital equipment and consumer goods other than foods. Energy prices edged up slightly, following small declines in June and July (table B).

Before seasonal adjustment, the Finished Goods Price Index moved up 1.0 percent to 249.0 (1967=100).

Over the year, this index rose 14.6 percent. The index for finished consumer foods was up 9.6 percent from August 1979 to August 1980, energy prices climbed 45.8 percent, the index for finished consumer goods other than foods and energy increased 12.3 percent, and capital equipment prices rose 11.7 percent. The Producer Price Index for intermediate goods moved up 14.2 percent over the year, and crude material prices were 16.3 percent higher than a year ago.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods rose 1.8 percent on a seasonally adjusted basis for the second consecutive month. As in July, the steep advance in August was primarily due to higher prices for consumer foods. Price increases accelerated for pork, beef and veal, and fresh and dried

vegetables. Processed poultry prices advanced 7.3 percent, after a 23.5 percent rise in July. Prices turned up after declining in July for refined sugar, roasted coffee, milled rice, and flour base mixes and doughs. Prices also rose for eggs, vegetable oil end products, and fish.

The index for finished consumer goods other than foods and energy rose 0.7 percent in August, considerably less than in either of the 2 previous months. Prices for apparel, sanitary papers and health products, textile housefurnishings, and nonalcoholic beverages rose much less than in July. Gold jewelry prices turned down, after increasing in the previous month. On the other hand, price increases accelerated for alcoholic beverages, soaps and synthetic detergents, and household flatware. Prices for passenger cars and household furniture rose almost as much as in July.

Prices for energy goods turned up slightly (0.2 percent), after declining 0.6 percent in both June and July. Home heating oil prices rose 0.8 percent, after 2 months of almost no change. Prices for finished lubricants also advanced. Gasoline prices fell for the third consecutive month.

Capital equipment. The index for capital equipment advanced 0.9 percent, less than in July and the same as in June. Motor truck prices rose 2.5 percent, compared with a 3.2 percent advance a month earlier. Price increases also slowed for integrating and measuring

instruments, power driven hand tools, oilfield machinery, machine tools, and construction machinery. Railroad equipment prices were unchanged, after rising rapidly in July. On the other hand, prices rose faster than in July for fans and blowers, mining machinery, and scales and balances.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components advanced 1.0 percent from July to August, seasonally adjusted, following increases of 0.8 percent in each of the 2 prior months. About half of the August advance was due to a 9.7 percent jump in the index for foods and feeds, the largest monthly climb since October 1974. Much of this increase was accounted for by sharply higher prices for feeds. Prices for animal fats and oils and refined sugar used in food manufacturing turned up substantially, after falling sharply in July. Prices also rose for corn syrup, vegetable oils, and flour.

The intermediate energy index moved up 0.4 percent, following a 2.6 percent advance in July and moderate rises in each of the 3 months before that. Price increases slowed considerably for residual fuel and electric power. Liquefied petroleum gas prices declined for the second consecutive month.

The index for intermediate materials other than foods and energy registered a 0.6 percent advance, more than in July but less than in June. The nondurable manufacturing materials index rose 0.9 percent, following 2 months of smaller increases. Prices for inedible fats and oils climbed nearly 25 percent; this index had fallen more than 30 percent from June 1979 to June 1980. Prices also rose for leather, gray fabrics, and phosphates. On the other hand, prices continued to decline for plastic resins and nitrogenates.

The durable manufacturing materials index edged up 0.2 percent, after turning down in the previous month. Substantial price increases for safety glass, foamed plastic products, and lead were partly offset by decreases for jewelers' materials, gold, and hardwood lumber. Steel prices were virtually unchanged, following a July decrease.

The index for construction materials rose 0.5 percent, the same as in July. Prices advanced for millwork, plywood, copper wire and cable, and prepared paint. Softwood lumber prices also rose but far less than in either June or July. Prices for most kinds of nonmetallic mineral products used for construction changed very little.

The manufacturing components index advanced 1.3 percent, more than in any of the 5 preceding months. This acceleration was largely due to a 2.5 percent increase in prices for motor vehicle parts, the largest rise since March 1977. Prices also rose for electronic components. Among other intermediate goods, higher prices were registered for unsupported plastic film and nonfarm tractor parts, while mixed fertilizer prices turned down.

Crude materials

The Producer Price Index for Crude Materials for Further Processing increased 5.7 percent in August on a seasonally adjusted basis, following a 6.3 percent rise in July. Foodstuff prices advanced as sharply as in the preceding month, energy materials rose almost as much as in July, but prices for materials other than foods and energy moved up much less.

The index for crude foodstuffs and feedstuffs climbed 9.0 percent in August, the same as in July. Prices for hogs, corn, oilseeds, and live poultry continued to rise rapidly, although not as steeply as in July. Cattle, hay, and wheat prices advanced more than in the preceding month. Raw cane sugar prices climbed nearly 27 percent, after falling sharply for 2 months. Green coffee prices moved down less than in July, and cocoa bean prices declined for the sixth consecutive month.

Prices for energy materials rose 1.3 percent, about as much as in most recent months. Crude petroleum prices advanced more than in any other month since January, but natural gas prices rose considerably less than in July.

The index for crude nonfood materials less energy rose 2.9 percent, after climbing 7.1 percent in July. Prices for cotton, nonferrous scrap, and potash moved up much less than in the preceding month, and leaf tobacco prices turned down. In contrast, prices for iron and steel scrap climbed 14.5 percent, after falling at an annual rate 46.8 percent in the first half of the year. Hides and skins advanced more than 12 percent for the third consecutive month. Wastepaper prices edged up slightly, after falling substantially for 3 months.

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 89 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and

finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

² All data are subject to revision 4 months after original publication.

¹ Indexes with a commodity point code of .99 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

² Data for April 1980 have been revised to reflect the availability of late reports and corrections by respondents. Data are not seasonally adjusted.

³ Seasonal commodity—no price available this month.

⁴ Some of the titles of the individual commodity price indexes included in this grouping are not shown.

⁵ Not available.

⁶ Prices for some items in this grouping are lagged 1 month.

⁷ Regional price indexes for bituminous coal, industrial sizes, contract are presented in table 8 of this report.

⁸ Prices for natural gas (05-31) are lagged 1 month.

⁹ Includes only domestic production. Some prices are lagged 1 month.

¹⁰ Prices for gasoline (05-71), light distillate (05-72), middle distillate (05-73), and residual fuels (05-74) are lagged 1 month.

¹¹ Regional refined petroleum product prices and price indexes are presented in table 7 of this report.

¹² Some prices for industrial chemicals (08-1) are lagged 1 month. N.E.C. Not elsewhere classified.

¹ Data for April 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices are lagged 1 month. Data are not seasonally adjusted.

² Caution should be used in interpreting month-to-month changes because of low response rates, which ranged from 30 to 60 percent for these indexes.

¹ Standard Transportation Commodity Code.

² The price index for total railroad freight also includes STCC groups not shown separately.

³ The figure shown for each item is its percent of total railroad freight.

⁴ December 1978 = 100.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, li-

quefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices

generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

<i>Index Point Change</i>	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
<i>Index Percent Change</i>	
Index point change	<u>1.0</u>
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed sub-products (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products

primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding Indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry

shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

For further information on the underlying concepts and methodology of the PPI revision, see two *Monthly Labor Review* articles by John F. Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. 1980's

Subjects include:

The labor force—expected changes in size and composition as a result of the continuing impact of the post-World War II baby boom, the increased participation of women, and the drop in the birth rate during the 1960's.

Gross national product and income—projected trends and major underlying assumptions on fiscal policy, productivity, and other factors affecting aggregate demand.

Industry output and employment—gross product originating in major sectors; employment in 149 industries

Distribution of demand—changing patterns in the major sectors of consumption, business investment, government expenditures, and foreign trade, and in 162 industries.

Four articles from the *Monthly Labor Review* and additional tables project the United States economy to 1990—growth, employment, output, income, and demand over the next decade.
