Price Movements

January 1981

The Producer Price Index for Finished Goods moved up 0.9 percent after seasonal adjustment from December to January. The January rise followed increases of 0.5 percent in December and 0.7 percent in both October and November. Prices for intermediate materials advanced 1.2 percent, the third consecutive monthly increase of 1.0 percent or more. Crude material prices, however, dropped 1.0 percent, almost as much as in December (table A).

Among finished goods, prices for finished energy goods climbed 2.7 percent, almost twice as much as in December. The consumer foods index showed no change, following 4 months of small increases. The increase for other finished consumer goods accelerated from 0.2 percent in December to 0.8 percent in January. Capital equipment prices continued to rise rapidly (1.0 percent).

Before seasonal adjustment, the Producer Price Index for Finished Goods moved up 1.1 percent to 259.8 (1967=100). Over the year, the Finished Goods Price Index rose 10.8 percent. Consumer food prices were up 8.1 percent from January 1980 to January 1981, the finished energy goods index climbed 26.1 percent, prices for finished consumer goods other than foods and energy increased 8.3 percent, and capital equipment prices advanced 10.8 percent. The Producer Price Index for intermediate goods rose 11.0 percent over the year, and crude material prices moved up 11.6 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods advanced 0.8 percent in January on a seasonally adjusted basis, following a 0.4

¹ Figures shown above and elsewhere in this report may differ from those previously reported because: (1) Stage-of-processing indexes from January 1976 through December 1980 have been revised to reflect the 1972 input-output relationships; (2) seasonal

adjustment factors have been recalculated to reflect developments during 1980; and (3) September 1980 data have been routinely revised to reflect late reports and corrections by respondents.

¹ Figures shown above and elsewhere in this report may differ from those previously reported because: (1) Stage-of-processing indexes from January 1976 through December 1980 have been revised to reflect 1972 input-output relationships; (2) seasonal adjustment factors have been recalculated to reflect developments during 1980, and (3) September 1980 data have been routinely revised to reflect late reports and corrections by respondents.

percent rise in December. Finished energy prices rose 2.7 percent, compared with a 1.4 percent increase a month earlier. From October through January, this index climbed at an annual rate of 26.2 percent, far more than the 4.5 percent annual rate of increase for the 6 months ended in October. Gasoline and home heating oil prices both increased more than twice as much as in December, while natural gas prices rose about as much as in the previous month.

The index for finished consumer goods other than foods and energy increased 0.8 percent in January, after a rise of 0.2 percent a month earlier. Prices rose faster than in December for passenger cars, textile housefurnishings, appliances, and prescription drugs. On the other hand, prices for sanitary papers and health products, household furniture, and floor coverings showed little or no change following December increases. Prices declined for sterling silverware and tires and tubes.

The index for consumer foods was virtually unchanged for the second consecutive month. Increases for soft drinks, dairy products, peanut butter, fish, and bakery products offset decreases for pork, beef and veal, processed poultry, fresh and dried fruits and vegetables, eggs, and roasted coffee. Refined sugar prices were unchanged, following a sharp decline in December.

Capital equipment. The Producer Price Index for capital equipment rose 1.0 percent, about the same as in

December. Motor truck prices turned up after edging down in December, and increases accelerated for commercial furniture, industrial material handling equipment, construction machinery, agricultural machinery, industrial process furnaces and ovens, and oilfield machinery. On the other hand, prices for aircraft and mining machinery edged down after substantial December increases, and pumps and compressors moved up less than in the previous month.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components rose 1.2 percent seasonally adjusted from December to January. Increases were broad-based, with the largest advances occurring for energy and energy-related products. Foods and feeds prices were relatively stable, following unusually sharp fluctuations during 1980.

The index for intermediate materials other than foods and energy increased 0.9 percent, somewhat more than in most recent months. The nondurable manufacturing materials category advanced 2.0 percent, more than in any month since January 1980. Sharp price increases were registered for several products derived from petroleum, including industrial chemicals, synthetic rubber, and synthetic fibers. Processed yarns and finished fabrics prices also moved up, partly because of

higher synthetic fiber costs. In addition, prices advanced for phenolic resins, paperboard, pharmaceutical materials, and nitrogenates. On the other hand, lower prices were recorded for leather and woodpulp.

The index for durable manufacturing materials edged up 0.1 percent, as continued large increases for finished steel mill products were offset by declining prices for silver, lead, and jewelers' materials. The manufacturing components index rose 1.1 percent. Prices advanced for motor vehicles parts, metal stampings, plastics components, electric motors, hardware, and bearings.

The construction materials index moved up 0.5 percent, less than in either of the 2 prior months. Plywood prices fell sharply, and small declines were recorded for softwood lumber, millwork, and copper wire and cable. In contrast, the indexes for fabricated structural metal products, wiring devices, switchgear and switchboards, structural clay products, asphalt roofing, and gypsum products increased substantially.

Sharp advances were also registered for metal containers, paper boxes and containers, industrial rubber products, laminated plastic sheets, mixed fertilizers, and parts for farm machinery and machine tools.

The intermediate energy index rose 2.8 percent, almost as much as in December. The largest increases were for diesel fuel, kerosene, and lubricating oil materials. Prices also moved up for residual fuel, electric power, commercial jet fuel, and liquefied petroleum gas.

The intermediate foods and feeds index was virtually unchanged, following a 5.6 percent decrease in the previous month. Prices for refined sugar used in food manufacturing turned up slightly, following a 23-percent drop in December. Prices also rose for grain by-product feeds, flour, and animal fats and oils. However, prices for formula feeds, vegetable cake and

meal feeds, refined vegetable oils, and confectionery materials declined somewhat.

Crude materials

The Producer Price Index for Crude Materials for Further Processing decreased 1.0 percent in January on a seasonally adjusted basis, following a 1.2 percent decrease in December. Prices for both foodstuffs and nonfood materials excluding energy fell for the second consecutive month. However, crude energy prices rose somewhat faster than in other recent months.

The index for crude foodstuffs and feedstuffs declined 1.1 percent, following a 2.6 percent decrease in December. Cattle prices moved down for the fifth consecutive month, and hog prices decreased even more than in December. Poultry prices also dropped sharply. On the other hand, wheat prices rose substantially after falling in both November and December, and corn prices moved up more than in the previous month. Raw cane sugar prices turned up after dropping 28.5 percent in December. Prices for soybeans, green coffee, and cocoa beans also rose following December declines.

The index for crude nonfood materials less energy dropped 5.8 percent, following a 0.6 percent decrease in December. Iron and steel scrap, cotton, and leaf tobacco prices turned down after rising in the preceding month. Prices for both nonferrous scrap and hides and skins declined more than in December, and natural rubber prices moved down for the third consecutive month. On the other hand, potash prices climbed sharply.

Prices for crude energy materials increased 2.2 percent, somewhat more than the 1.7 percent rise in December. Crude petroleum prices advanced 3.2 percent, compared to a 2.6 percent increase in December. Natural gas prices rose about as much as in December.

Revisions in Stage-of-Processing Indexes

Beginning with this report Producer Price Indexes (PPI) at all stages of processing reflect updated industry input-output relationships and improved classification of some products. The text and tables 1, 2, and 3 of this report are based on stage-of-processing data, developed from PPI commodity indexes regrouped into various categories—crude, intermediate, or finished goods—according to the latest available input-output values. (For a definition of the major stage-of-processing categories, see “Brief Explanation of Producer Price Indexes,” later in this issue.) The new stage-of-processing relationships are based upon 1972 input-output tables prepared by the Bureau of Economic Analysis, U.S. Department of Commerce. From January 1976 through December 1980, stage-of-processing indexes were based on relationships from the 1967 input-output tables.

The most significant reclassification is in the Finished Goods Price Index and in the Crude Materials Price Index as a result of a change in the allocation of the natural gas index (PPI commodity code 05-31). Until now, the entire weight of this index has been allocated to the stage-of-processing index for crude fuels. Beginning with this report, approximately half the weight of this index is allocated to the stage-of-processing index for consumer nondurable goods excluding foods, since households purchase natural gas in an essentially unprocessed form. In addition, the Finished Goods Price Index no longer incorporates weights reflecting the value of shipments purchased by the government or exported, since these categories do not fit the existing components of the Finished Goods index—finished consumer goods and capital equipment. New input-output tables are sufficiently detailed for the first time to separate the weights for government purchases and for exports, for which prices are not collected.

The effects of the revisions in previously published stage-of-processing indexes are modest. The Finished Goods Price Index still shows an 11.7 percent advance from December 1979 to December 1980. One notable

revision within the Finished Goods category is the Finished Consumer Foods index, which now shows a 7.3 percent rise in 1980 instead of a 6.5 percent rise. The index for Intermediate Materials, Supplies, and Components shows virtually the same change for 1980 after revision (12.5 percent) as was originally reported (12.6 percent). The revised Producer Price Index for Crude Materials for Further Processing increased 11.9 percent from December 1979 to December 1980, rather than 13.3 percent as reported last month.

Table 1 of this report has been expanded to show data for two additional stage-of-processing indexes under the Finished Goods category: Capital equipment for manufacturing industries and capital equipment for nonmanufacturing industries. Publication of these two indexes was suspended several years ago because available input-output data were not sufficiently detailed to permit such a distinction. That problem has been solved with the detail available in the 1972 input-output data. In addition, the lists of commodity groupings under various stage-of-processing categories in table 2 have been modified slightly to reflect major shifts in stage-of-processing allocation patterns. For example, the commodity grouping formerly called “nonalcoholic beverages” (commodity code 02-62) has been renamed “soft drinks” to reflect the composition of the index more accurately; there is no change in composition. The soft drinks index has been reclassified under finished consumer foods instead of finished consumer goods excluding foods.

Revised historical stage-of-processing indexes for January 1976 through December 1980 are available on request from BLS. These revised data reflect the updated stage-of-processing relationships and reclassifications, as well as the separation of the weights for government purchases and for exports from the Finished Goods Price Index. These revisions do not affect previously reported indexes for individual commodities and commodity groups.

Recalculation of Seasonal Adjustment Factors

Effective with data for January 1981, seasonal adjustment factors have been recalculated to reflect 1980 price movement patterns for stage-of-processing (SOP) groupings, commodity groups, and durability groupings. This routine annual recalculation may affect seasonally adjusted indexes and percent changes from January 1976 to present. Revised seasonally adjusted

data for this period, as well as seasonal factors to be used through December 1981, are available on request from BLS. Table C below shows 1980 monthly seasonally adjusted percent changes for the three major SOP allocations, compared with the percent changes for recalculated indexes which incorporate both the new seasonal factors and the revised SOP allocations.

Addition of Data from the Producer Price Index Revision

Indexes for 29 more industries are now calculated from the comprehensive program to revise the Producer Price Index (PPI). Output price indexes are available for these industries and their major products beginning this month. The PPI revision program now covers 56 industries, which account for 17.7 percent of all mining and manufacturing production.

Industries being published for the first time in this phase of the PPI revision are the following:

<i>Standard Industrial Classifica- tion (SIC) code</i>	<i>Industry title</i>
2011	Meat packing plants
2048	Prepared feeds, n.e.c.
2211	Cotton broadwoven fabrics
2311	Men's and boys' suits and coats
2335	Women's, misses', and juniors' dresses
2421	Sawmills and planing mills
2436	Softwood plywood
2731	Book publishing
2812	Alkalies and chlorine
2821	Plastic materials and resins
2892	Explosives
2992	Lubricating oils and greases
3021	Rubber and plastics footwear
3143	Men's footwear
3144	Women's footwear
3211	Flat glass
3291	Abrasive products
3321	Gray iron foundries
3351	Rolling, drawing, and extruding of copper
3431	Metal sanitary ware
3531	Construction machinery

3546	Power-driven hand tools
3533	Oilfield and gasfield machinery and equipment
3552	Textile machinery
3553	Woodworking machinery
3576	Scales and balances except laboratory
3676	Resistors for electronic applications
3678	Connectors for electronic applications
3692	Primary batteries, dry and wet

Product indexes from these industries will now be used to calculate 143 corresponding traditional commodity indexes.

Also this month, 423 new items have been added to the list of commodities in the PPI. Price movements for these items are based on the corresponding product indexes introduced from the PPI revision. This brings the number of commodity indexes whose movements are based on data from the PPI revision to 823. A comprehensive summary of the various changes associated with the January 1981 additions of data from the PPI revision will appear in the February issue of this report.

Indexes from the PPI revision appear in table 4 of this report. Traditional indexes which correspond to the new indexes published in the revision program are now based on movements of the corresponding revision indexes. As new industries are published, their product indexes also will be used in the traditional commodity and ISPI structures. Introduction of the next set of indexes for industries based on the PPI revision program is planned for July 1981.

For a summary of the major differences between the new indexes and traditional commodity price indexes and ISPI's, see the technical note on "Data from the Producer Price Index Revision" in the back of this issue.

New Base for Producer Price Indexes

Beginning with the release of January 1982 data in February 1982, most Producer Price Indexes will shift to a new base year. All indexes currently expressed on a base of 1967 = 100, or any other base through December 1976, will be rebased to 1977 = 100. Only indexes with a base later than December 1976 will keep their current base. Rebasings of PPI data is part of a comprehensive rebasing of indexes published by the Federal Government. (See Technical Note, "Federal agencies updating base year of indexes to 1977," in the February 1981 issue of *Monthly Labor Review*.) The last rebasing of PPI data occurred in January 1971, when the current 1967 base was substituted for the former 1957-59 base.

Historical data for each PPI series on the new base will be available from BLS on request.

To convert any continuous index series on the 1967 base to a new continuous series on the 1977 base, divide each index value on the former base by the index value for the new base period and multiply by 100. For example, the August 1980 index for steel mill products was 301.0 (1967 = 100). To convert that index to a base of

1977 = 100, divide 301.0 by the 1977 annual average for steel mill products on a 1967 = 100 base, which was 229.9. The August 1980 index for steel mill products on a base of 1977 = 100 thus becomes:

$$(301.0/229.9) \times 100 = 130.9$$

Rebasing an index does not affect the calculation of percent changes over time, except for possible rounding differences, so long as all calculations are performed with indexes expressed on the same base. Long-term business contracts with escalation clauses which make changes in selling or buying prices dependent on percent changes in specified PPI series should, therefore, not be substantively affected by the rebasing next year. However, contracts with escalation clauses which make price changes dependent on changes in index points may be greatly affected by rebasing. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 570, available on request.)

* Comprehensive relative importance figures are computed once each year in December.

² Data for September 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

³ Not seasonally adjusted.

⁴ Includes crude petroleum.

⁵ Excludes crude petroleum.

⁶ Percent of total finished goods.

⁷ Percent of total intermediate materials.

⁸ Formerly titled "Crude materials for further processing, excluding crude foodstuffs and feedstuffs, plant and animal fibers, oilseeds, and leaf tobacco."

⁹ Percent of total crude materials.

NOTE: Data shown may differ from those previously reported. See footnote 1 for table A.

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 89 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed.

For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

¹ Data for September 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices are lagged 1 month. Data are not seasonally adjusted.

² Caution should be used in interpreting month-to-month changes because of low response rates, which ranged from 30 to 60 percent for these indexes.

¹ Standard Transportation Commodity Code.

² The price index for total railroad freight also includes STCC groups not shown separately.

³ The figure shown for each item is its percent of total railroad freight.

⁴ Dec. 1978 = 100.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, li-

quefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices

generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
Index Percent Change	
Index point change	<u>1.0</u>
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed sub-products (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products

primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding Indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry

shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979.
