Price Movements

June 1981

The Producer Price Index for Finished Goods moved up 0.6 percent from May to June on a seasonally adjusted basis. The June increase followed a 0.4 percent rise in May and a 0.8 percent advance in April. Prices for intermediate goods increased 0.3 percent, considerably less than in most recent months. Crude material prices, however, advanced 1.2 percent, after falling 0.5 percent in May (table A).

Among finished goods, consumer food prices rose 0.5 percent, after showing virtually no net change from November through May. Finished energy prices edged up 0.2 percent, following a 0.5 percent drop in the previous month and steep climbs during each of the first 4 months of the year. Prices of finished consumer goods other than foods and energy rose 0.6 percent for the second consecutive month. Capital equipment prices increased 0.7 percent, slightly less than in either of the 2 preceding months.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved up 0.4 percent to 269.9 (1967 = 100). Over the year, the Finished Goods Price Index rose 10.2 percent. The finished consumer foods index increased 8.6 percent from June 1980 to June 1981, prices for finished energy goods climbed 19.3 percent, the index for finished consumer goods other than foods and energy rose 8.0 percent, and capital equipment prices were up 11.0 percent. The Producer Price Index for intermediate goods increased 10.2 percent over the year, and crude material prices were 15.9 percent higher than in June 1980.

foods moved up 0.5 percent, following 2 months of no change. Prices turned up after declining in May for pork, eggs, milled rice, and refined sugar. Fresh and dried vegetables and vegetable oil end products edged up slightly, following substantial declines in the prior month. Prices for beef and veal advanced 2.4 percent, after a 0.3 percent rise in May. Prices also increased for bakery products, processed fruits and vegetables, and dairy products. On the other hand, prices turned down in June after advancing a month earlier for processed poultry and fresh fruits. Prices for fish were unchanged after increasing in May, and soft drink prices rose considerably less than a month earlier. Roasted coffee prices fell, continuing the downward trend of the last 18 months.

Prices for finished energy goods edged up 0.2 percent, following a 0.5 percent decline in the previous month. Prices for home heating oil turned up 0.4 percent, after a 1.2 percent decrease in May. Prices for natural gas rose even more than in other recent months. Gasoline prices dropped 1.2 percent, not as much as in May (1.8 percent).

The index for finished consumer goods other than foods and energy rose 0.6 percent, the same as in May. Price increases slowed markedly for durables such as motor vehicles, floor coverings, luggage, dinnerware, and glassware. Prices for gold jewelry turned down after 2 months of little or no change. On the other hand, price increases accelerated for some consumer non-durables, particularly apparel and books; prices for

cosmetics turned up after decreasing in May. Prices for over-the-counter drugs edged down after rising rapidly in April and May, however.

Capital equipment. The Producer Price Index for capital equipment moved up 0.7 percent, after rising 0.9 percent in both April and May. Heavy motor truck prices rose 2.6 percent, compared to 2.1 percent in May. Increases occurred for most other capital goods; some of the largest advances were for aircraft, generators, pumps and compressors, integrating and measuring instruments, packaging machinery, oilfield machinery, mining machinery, and fans and blowers. Prices also rose but less than in May for agricultural machinery, construction machinery, commercial furniture, chemical industry machinery, and textile machinery. Prices turned down after rising in May for photographic equipment.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components edged up 0.3 percent on a seasonally adjusted basis, the smallest increase in more than a year. Price changes were comparatively moderate for most categories of intermediate goods.

The intermediate energy goods index declined 0.7 percent, the first drop of roughly that magnitude since the summer of 1978. Residual fuel prices fell considerably; lower prices were also registered for diesel fuel, commercial jet fuel, kerosene, and liquefied petroleum gas.

However, the index for electric power continued to rise substantially.

The intermediate foods and feeds index moved down for the fifth time in the last 7 months, as feed prices decreased sharply. Prices for confectionery materials and crude vegetable oils continued to decline. In contrast, prices for refined sugar used in food manufacturing, flour, and refined vegetable oils turned up after decreasing in May.

The index for intermediate materials other than foods and energy increased 0.5 percent, slightly less than in May. Most categories rose about as much as in the previous month; however, the durable manufacturing materials index was unchanged, following 0.2 percent advances in both April and May. Substantially lower prices for copper, gold, silver, tin, and jewelers' materials were offset by increases for nonferrous mill shapes, magnesium, lead, and titanium sponge.

The nondurable manufacturing materials index rose 0.6 percent. Price increases accelerated for paper, gray fabrics, and plastic resins, but the rate of advance slowed for synthetic fibers, processed yarns, paint materials, industrial chemicals, nitrogenates, and paperboard. Prices for inedible fats and oils surged after turning down in the preceding month, while leather prices decreased about as much as in May.

The index for construction materials moved up 0.7 percent. Prices rose for fabricated structural metal products, concrete products, wiring devices, asphalt roofing, and plywood. Prices for copper wire and cable and millwork continued to fall, however, and prices for softwood lumber and building paper and board rose much less than in either April or May.

Within the manufacturing components category,

large advances were recorded for foundry and forge shop products, aluminum zippers, and machine shop products. Among other intermediate goods, prices rose sharply for pesticides, paper boxes and containers, industrial rubber products, agricultural machinery parts, and laminated plastic sheets.

Crude materials

The Producer Price Index for Crude Materials for Further Processing increased 1.2 percent on a seasonally adjusted basis, after decreasing 0.5 percent in May. The index for crude foodstuffs and feedstuffs turned up 2.8 percent, following a 2.2 percent fall in May. Cattle and hog prices rose sharply in June after decreasing rapidly in most recent months. After falling 61.8 percent from October through May, raw cane sugar prices rebounded with a 17.1 percent climb. Fluid milk prices rose more than in other recent months. Corn and wheat prices edged up, following May declines. On the other hand, prices for hay, oilseeds, and live poultry decreased, after rising in May. Green coffee, cocoa beans, and barley prices all moved down more than 12 percent.

The index for crude nonfood materials other than energy fell 0.8 percent, after climbing about 3 percent in both April and May. Prices for ferrous and nonferrous scrap and crude natural rubber fell, after rising in the previous month. On the other hand, higher prices were registered for potash and wastepaper.

The crude energy index edged down 0.4 percent, following small increases in April and May. Crude petroleum prices declined much more than in May. However, prices for natural gas moved up at an even faster pace than in May. Coal prices turned up, after falling slightly in the previous month.

New Base for Producer Price Indexes

Beginning with the release of January 1982 data in February 1982, most Producer Price Indexes will shift to a new base year. All indexes currently expressed on a base of 1967 = 100, or any other base through December 1976, will be rebased to 1977 = 100. Only indexes with a base later than December 1976 will keep their current base. Rebasings of PPI data is part of a comprehensive rebasing of indexes published by the Federal Government. (See Technical Note, "Federal agencies updating base year of indexes to 1977," in the February 1981 issue of *Monthly Labor Review*.) The last rebasing of PPI data occurred in January 1971, when the current 1967 base was substituted for the former 1957-59 base.

Historical data for each PPI series on the new base will be available from BLS on request.

To convert any continuous index series on the 1967 base to a new continuous series on the 1977 base, divide each index value on the former base by the index value for the new base period and multiply by 100. For example, the August 1980 index for steel mill products was 301.0 (1967 = 100). To convert that index to a base of

1977 = 100, divide 301.0 by the 1977 annual average for steel mill products on a 1967 = 100 base, which was 229.9. The August 1980 index for steel mill products on a base of 1977 = 100 thus becomes:

$$(301.0/229.9) \times 100 = 130.9$$

Rebasing an index does not affect the calculation of percent changes over time, except for possible rounding differences, so long as all calculations are performed with indexes expressed on the same base. Long-term business contracts with escalation clauses which make changes in selling or buying prices dependent on percent changes in specified PPI series should, therefore, not be substantively affected by the rebasing next year. However, contracts with escalation clauses which make price changes dependent on changes in index points may be greatly affected by rebasing. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 570, available on request.)

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 89 percent of total finished goods, about 88 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown

reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

² All data are subject to revision 4 months after original publication.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, li-

quefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices

generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
Index Percent Change	
Index point change	<u>1.0</u>
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed sub-products (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products

primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding Indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967=100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry

shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

For further information on the underlying concepts and methodology of the PPI revision, see two *Monthly Labor Review* articles by John F. Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979.
