*Producer Price Indexes* is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights. (ISSN 0882-5270)

To order this periodical for 1 year, cite *Producer Price Indexes* (WPPI) and send your check for \$34.00 (\$42.50 foreign) or provide your VISA or Master card number and expiration date to Superintendent of Documents, P.O. Box 371954, Pittsburgh, PA 15220-7954.

Subscribers will receive the next available subscription issue after their order is received. An acknowledgement card is sent to all customers directly after their subscription order is processed simply to let them know that they will receive the next available issue released for their subscription order.

Please wait at least 6 weeks before inquiring about your order. Then write to Subscription Service Section, U.S. Government Printing Office, Stop: SSOM, Washington DC 20402, telephone (202) 512-1806 or FAX (202) 512-2168.

To change your address: Please send your mailing label, along with your new address to the Superintendent of Documents, Attn: Chief, Mail List Branch, Mail Stop: SSOM, Washington, DC 20402.

Information in this publication is made available to sensory impaired individuals upon request. Voice phone: (202) 606-7828; TDD phone (202) 606-5897; TDD message referral phone: 1-800-326-2577. # Price Movements

## February 1995

The Producer Price Index for Finished Goods increased 0.3 percent in February, seasonally adjusted. This was the same as the January rise, which followed a 0.4-percent advance in December. Prices received by domestic producers of intermediate goods moved up 0.9 percent in February, after increasing 1.0 percent in the previous month. The Crude Goods Price Index moved up 1.5 percent after increasing 1.0 percent in December. (See table A.)

Among finished goods, prices for consumer foods turned up 0.3 percent after falling 0.6 percent in January. Price increases for energy goods slowed from 2.3 percent in January to 0.4 percent in February. The index for finished goods other than foods and energy increased 0.3 percent after moving up 0.2 percent in the previous month.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved up 0.3 percent in February to 126.9 (1982 =100). From February 1994 to February 1995, the Finished Goods Price Index rose 1.7 percent. During this same period, consumer food prices increased 1.3 percent, the index for finished energy goods advanced 2.3 percent, and prices for finished goods other than foods and energy were up 1.7 percent. Prices received by domestic producers of intermediate goods increased 5.7 percent during the 12 months ended in February 1995, and crude material prices advanced 0.9 percent over the same period.

### Finished goods

Prices for finished consumer foods increased 0.3 percent in February, seasonally adjusted, following a 0.6-percent decline in January. Prices turned up after falling in the previous month for dairy products, eggs for fresh use, roasted coffee, processed turkeys, and milled rice. Prices for fresh and dried vegetables fell much less in February (6.0 percent) than in January (26.6 percent). Price increases accelerated for confectionery end products, finfish and shellfish, pasta, and for processed fruits and vegetables. By contrast, pork prices rose 0.8 percent in February, following a 5.8-percent advance in the previous month. Price increases also slowed for beef and veal, soft drinks, and processed young chickens. The index for shortening and cooking oils turned down 2.4 percent, the same amount that it increased in January. Prices for fresh fruits and melons fell more in February than in January.

The Producer Price Index for finished energy goods moved up 0.4 percent in February, following a 2.3-percent rise in the previous month. Price increases for gasoline slowed from 7.9 percent in January to 0.8 percent in February. Prices for residential electric power and residential natural gas turned down after increasing a month earlier. By contrast, prices for home heating oil turned up 6.5 percent after declining 5.2 percent in January.

<sup>1</sup> Data for October 1994 have been revised to reflect the availability of late reports and corrections by respondents. For this reason, some of the

figures shown above and elsewhere in this report may differ from those previously published.

The index for consumer goods other than foods and energy moved up 0.3 percent in February, after inching up 0.1 percent in January. Prices turned up after falling a month earlier for prescription drugs, over-the-counter drugs, alcoholic beverages, and apparel. Price increases accelerated for sanitary papers, leather footwear, mobile homes, floor coverings, and household glassware. Prices for tobacco products, costume jewelry, and household flatware increased somewhat after showing no change a month earlier. Prices for periodicals fell much less in February than in January. By contrast, prices turned down after rising a month earlier for cosmetics, passenger cars, books, light trucks, and gold jewelry. Price increases slowed for textile house furnishings and sporting goods.

In February, the capital equipment index rose 0.3 percent, the same as in January. Increases were registered for ships, heavy motor trucks, railroad equipment, and mining machinery. By contrast, prices declined for electronic computers (1.8 percent), office and store machines, and light motor trucks.

### Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components increased 0.9 percent seasonally adjusted in February, after rising 1.0 percent in January. When food and energy prices are excluded, this index increased 1.0 percent for the second consecutive month. Prices for both durable and nondurable manufacturing materials, construction materials, energy goods, and containers rose in February. In contrast, the foods and feeds index declined over the month. (See table B.)

The index for durable manufacturing materials increased 1.3 percent after rising 1.8 percent a month earlier. The rise

in the aluminum mill shapes index slowed to 6.4 percent in February from 9.6 percent in the previous month. Prices for hot rolled steel bars and prepared paints also rose less than in January. Indexes for aluminum, copper, and for copper and brass mill shapes turned down after rising a month ago. The rise in the cold rolled steel sheet index, however, accelerated to 4.2 percent from 0.6 percent in January. Prices for building paper and board turned up after falling a month earlier.

The rise in the index for nondurable manufacturing materials slowed to 1.7 percent in February from 2.0 percent a month earlier. The primary organic chemicals index turned down 0.9 percent in February after rising 3.4 percent in the previous month. Prices for inedible fats and oils and paint materials also fell after rising in January. Indexes for miscellaneous basic organic chemicals, nitrogenates, and for plastic resins and materials rose less than in the previous month. By contrast, the index for alkalies and chlorine turned up 10.6 percent after declining 2.1 percent in January. Prices for medicinal and botanical chemicals also rose after falling a month earlier. In addition, indexes for paper and gray fabrics rose more than in January.

Prices for intermediate foods and feeds registered a 0.2-percent decline in February after increasing 0.7 percent in January. The index for prepared animal feeds turned down 1.3 percent after rising 0.2 percent in January. Prices for pork and for beef and veal rose less than in the prior month. In addition, the flour index fell more than in January. The index for fluid milk products, however, turned up 1.1 percent after falling the same amount a month earlier. Prices for canned milk products also rose after declining in the previous month. The natural and processed cheese index rose more than in January.

The index for materials and components for construction rose 0.4 percent in February after increasing 0.6 percent in the previous month. The softwood lumber index declined 5.7 percent in February after falling 1.3 percent a month earlier. The millwork index declined after remaining unchanged in January. Prices for fabricated structural metal products, nonferrous wire and cable, and concrete products rose less than they had a month ago. In contrast, the index for gypsum products turned up 2.7 percent in February after falling 1.1 percent a month earlier. Prices for plumbing fixtures and brass fittings and plastic construction products rose more than in January.

The rise in the Producer Price Index for intermediate energy goods slowed to 0.8 percent from 1.0 percent in January. The gasoline index increased 0.8 percent in February after rising 7.9 percent in the previous month. Prices for residual fuel and natural gas to electric utilities turned down after increasing a month earlier. The industrial natural gas index fell more than it had a month ago. The diesel fuel index, however, turned up 5.7 percent in February after falling 1.1 percent a month earlier. Prices for liquefied petroleum gas and both commercial and industrial electric power rose more than in January. In addition, the jet fuel index fell less than it had a month ago.

The rise in the container index accelerated to 3.9 percent in February from 1.9 percent in January. The index for paper boxes and containers increased 3.3 percent after rising 2.4 percent in the previous month, and aluminum can prices surged 19.6 percent after increasing 3.6 percent a month earlier.

### **Crude goods**

The Producer Price Index for Crude Materials for Further Processing advanced 1.5 percent in February, following a 1.0-percent rise in January. The index for basic industrial materials rose less in February than in January, while the indexes for both foodstuffs and feedstuffs and crude energy materials rose after falling in the previous month. (See table B.)

The crude energy materials index jumped 4.5 percent in February after 5 consecutive months of price declines. The index for natural gas to pipelines declined less than in the previous month. Crude petroleum prices rose more rapidly in February (5.4 percent) than in January (2.5 percent). However, coal prices fell 1.1 percent, after declining 0.1 percent in January.

Prices for the crude foodstuffs and feedstuffs index gained 1.2 percent for the month after dropping 0.1 percent last month. The index for fresh and dried vegetables fell 6.0 percent, significantly less than the 26.6 percent decline in the previous month. Prices for slaughter turkeys also fell less in February than in January. Prices for slaughter broilers, corn, fluid milk, and wheat increased after declining in January. In contrast, prices for both slaughter hogs and slaughter cattle rose less than in the previous month.

Prices increases for the crude nonfood materials less en-

ergy index slowed from 3.0 percent in January to 1.4 percent in February. The iron and steel scrap index fell 0.9 percent, after moving up 4.8 percent in January. Indexes for aluminum base scrap, copper base scrap, pulpwood logs, and silver ores also turned down after increasing in the preceding month. Price increases slowed for wastepaper, copper ores, raw cotton, and phosphates. The index for softwood logs, however, rose 4.2 percent in February after rising 0.6 percent a month earlier.

### **Net output price indexes for mining, manufacturing, and other industries**

*Mining.* The Producer Price Index for the net output of total domestic mining industries increased 1.3 percent in February after falling in both of the previous 2 months. (Net output price indexes are not seasonally adjusted.) In February, prices turned up 1.8 percent after falling 1.0 percent a month earlier for the oil and gas extraction industry group index. The index for nonmetallic minerals mining rose about 1 percent for the second consecutive month. By contrast, prices turned down after rising in the previous month for the anthracite mining industry group. Prices for the bituminous coal and lignite mining industry group fell 0.9 percent, after moving down 0.3 percent a month earlier. Price increases for the metal mining industry group slowed from 3.9 percent in January to 0.8 percent in February.

*Manufacturing.* The Producer Price Index for total domestic manufacturing industries advanced 0.5 percent in February, about the same as in January. In February, prices for the paper industry group increased 3.1 percent after rising 2.2 percent in January; this index is about 16 percent higher than its level of a year ago. Price increases were registered for all of the industry groups comprising the manufacturing sector except lumber and wood products and transportation equipment which were unchanged. The largest advances were for petroleum refining (1.8 percent), chemicals and allied products (1.7 percent), and primary metal industries (1.5 percent).

*Other.* Among other industries, prices for waste paper collection advanced almost 10 percent in February, the fourth consecutive substantial monthly increase. Other large increases in February occurred for passenger car rental (5.8 percent), non-air courier services (4.3 percent), local trucking with storage (3.2 percent), and scheduled air passenger transportation (2.3 percent).

Prices turned up after showing little or no change a month earlier for farm products warehousing and storage and for air courier services. Price increases accelerated for medical

Prices turned up after showing little or no change a month earlier for farm products warehousing and storage and for air courier services. Price increases accelerated for medical laboratories and for skilled and intermediate care facilities.

Several categories were unchanged after rising substantially in the previous month: U. S. Postal Service; water transportation of freight, not elsewhere classified; crude petroleum pipelines; and refined petroleum pipelines. Prices turned down in February after rising in January for metal scrap

in February after rising in January for metal scrap collection, electric power utilities, natural gas utilities, freight transportation arrangement, and for tugging and towing services. Price increases slowed for hotels and motels and for offices and clinics of doctors of medicine.

# Assessing the Impact of Recent Changes to the Producer Price Index Seasonal Adjustment Methodology

“Summary of Changes to the PPI’s Seasonal Adjustment Methodology” in the January 1995 issue of *Producer Price Indexes* gives an overview of changes made in the PPI seasonal adjustment methodology. This article highlights the effects of these changes on the finished goods and finished goods less food and energy indexes. In addition, table 4 provides a detailed list of the current seasonal adjustment status of each PPI series and notes status changes under the new method. (A status change means that a seasonally adjusted series is changed from seasonally adjusted to not seasonally adjusted, or vice versa.)

BLS routinely recalculates the PPI seasonal adjustment factors in January of each year to incorporate price movements for the 12-month period that ended in the previous December. To accomplish this recalculation, the 8-year moving data span for calculating seasonal adjustments was updated by dropping the earliest year and adding the recently completed year. For example, in January 1995, 1986 was dropped and 1994 added. Then, new seasonal factors were estimated with the new PPI method, and seasonally adjusted indexes were revised for the last 5 years.

To assess the effect of the new seasonal adjustment procedures, BLS staff focused on the revisions in the seasonally adjusted data. These revisions may have been due to the “data effect” from updating the 8-year moving data span for seasonal adjustment, or to the “method effect” from implementing the new PPI seasonal adjustment method.

The difference between the data effect and the method effect can be measured by calculating the seasonally adjusted data using the old seasonal adjustment procedures for the updated data span. This includes using the Census Bureau’s X-11 program (instead of Statistic Canada’s X-11 ARIMA/88 program) with the former seasonal adjustment status designations for each series.

The simulation was conducted for finished goods and finished goods less food and energy. Table 1 presents 1-month percent changes for the last few years. The “Former” columns are seasonally adjusted data as published prior to the recalculations. “Recalculated” refers to the recalculated percent changes using the old and new methods. Differences in these percent changes give the method effect. As can be seen, most differences between the old and new methods are equal to about 0.1 percentage point, but there are 0.2 percentage

point differences in November 1992 and December 1994 for finished goods and in November 1993 for finished goods less food and energy. Likewise, differences between the old and former percent changes give the data effect. For finished goods, the maximum difference is 0.3 percentage point, and for finished goods less food and energy, it is 0.2 percentage point. Mean absolute difference (MAD) statistics also can be computed from table 1. Using MAD, the method effect for finished goods is 0.06, and the data effect is 0.07. For finished goods less food and energy, the method effect is 0.03, and the data effect is 0.06.

While both the old and new seasonal adjustment procedures paint similar pictures of inflation for the past few years, it is interesting to note that more differences due to the method effect occur for finished goods than for finished goods less food and energy. It is correct to conclude that this is because of the seasonal adjustments in the volatile finished food and finished energy areas. However, intervention analysis seasonal adjustment (IASA) methods are used to seasonally adjust components of the finished energy index, and these seasonal adjustments are the same under both the old and new systems. Thus, most differences for finished goods that are due to the method effect are the result of switched seasonal adjustment status in the foods area and not the energy area. (The reader may wish to consult table 4 for seasonal adjustment status changes in 6-digit codes that begin with “01” or “02” as they correspond to food indexes.)

Another important dimension for assessing the effect of the new seasonal adjustment procedures is its effectiveness in preventing residual seasonality. Residual seasonality refers to seasonality that remains in a series after Seasonal adjustment.

The basic test for seasonality is the F-statistic for stable seasonality ( $F_s$ ) from the X-11ARIMA/88 program. The critical value for this statistic is 7.0. A series tests as seasonal if  $F_s$  is at least 7.0. The basic test for residual seasonality also uses the F-statistic for stable seasonality. Specifically, we seasonally adjust the seasonally adjusted data and recompute the F-statistic. A high F-value would indicate the presence of residual seasonality. A low F-value would indicate an acceptable seasonal adjustment. This F-statistic is denoted as  $F_r$  in table 2 and is presented for both the old and new procedures.

As can be seen in table 2, there is no evidence of residual seasonality in either index based on Fr. However, one of the values for the old procedures using the current span (the Fr=5.2) was uncomfortably close to the critical value of 7.0. The new procedures reduce this value to an acceptable Fr=3.4.

Table 3 presents the distribution and relative importance of 6-digit indexes by their seasonal adjustment status. Some

149 indexes, accounting for 59.7 percent of the relative importance in finished goods were seasonally adjusted with the old method, while 131 indexes, accounting for 50.8 percent of the relative importance, are seasonally adjusted using the new method.

<sup>1</sup> Indexes in this table are derived from the net-output-weighted industry price indexes shown in table 5. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly-titled indexes which are derived from traditional commodity groupings shown in table 6.

<sup>2</sup> Data for October 1994 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

1/ Indexes in this table are derived from the primary product indexes in table 5 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the economy, excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of the July 1986 issue of Producer Price Indexes.

1/ Indexes in this table are derived from the product indexes in table 5. These indexes are composed of the goods used by the industries in each of the industry stage of process output indexes as shown by the 1977 input/output relationships. These material inputs include only domestic material input and do not include any imported materials which may be used.

## Brief Explanation of Producer Price Indexes

Producer Price Indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,200 commodities and 80,000 quotations per month.

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 5). The commodity structure (table 6) organizes products by similarity of end-use or material composition.

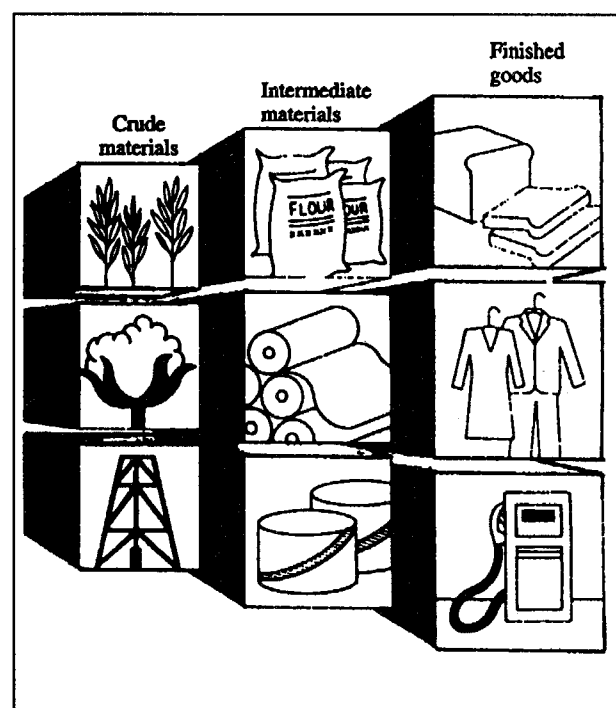

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, and nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude

foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer Price Indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extension of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 4 lists indexes for the net output of major mining and manufacturing industry groups at the 2-digit level. Table 5 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establish-

ments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 5 correspond to 8-digit commodity indexes in table 6. In these cases, movement of the latter indexes are calculated on the basis of movements of their counterparts in table 5. Although most such indexes continue to be published in table 6 on a base period of 1982=100 or some later base, corresponding indexes in table 5 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing indexes) calculated from traditional commodity groupings currently reflect 1987 values of shipments as reported in the *Census of Manufactures* and other sources. From January 1987 through December 1991, PPI weights were derived from 1982 shipment values. Many industry indexes which are based on the SIC system, continue to be calculated with 1987 net output weights.

Effective with publication of January 1988 data, many important PPI series (including all stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100, to coincide with the reference year of shipment weights. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not alter previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

## Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The computation of index point and percent changes is shown in the box.

<i>Index point change</i>	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
<i>Index percent change</i>	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Results multiplied by 100	0.034x100
Equals percent change	3.4

Percent changes for 3-month and 6-month period can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1982 or some later month). An in-

crease of 5.5 percent from the reference period in the Finished Goods Price Index for example, is shown as 105.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$105.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods today are 10 percent lower than they were in 1982.

### Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists; and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, 1991 edition, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived from the X-11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January through December

1991 were replaced at the beginning of 1992. Indexes for most broad commodity groupings and 8-digit individual commodities in table 6, as well as industry and Census product indexes in tables 4 and 5, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, i.e., independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 6 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregate method, which combines movements of the basic stage-of-processing categories with those of a wide variety of food and certain other subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behavior abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.
