Producer Price Indexes – January 2015

The Producer Price Index for final demand decreased 0.8 percent in January, seasonally adjusted. Final demand prices moved down 0.2 percent in both December and November. On an unadjusted basis, the index for final demand was unchanged for the 12 months ended in January. (See table A.)

In January, the 0.8-percent decline in final demand prices can be traced primarily to a 2.1-percent decrease in the index for final demand goods. Prices for final demand services fell 0.2 percent.

Within intermediate demand, the index for processed goods declined 2.8 percent, prices for unprocessed goods dropped 9.4 percent, and the index for services moved down 0.2 percent. (See tables B and C.)

Final Demand

Final demand goods: The index for final demand goods moved down 2.1 percent in January, the seventh consecutive decrease. Leading the broad-based decline in January, prices for final demand energy fell 10.3 percent. The indexes for final demand foods and for final demand goods less foods and energy moved down 1.1 percent and 0.2 percent, respectively.

Product detail: The decline in prices for final demand goods was led by the index for gasoline, which dropped 24.0 percent. Prices for diesel fuel, jet fuel, basic organic chemicals, dairy products, and home heating oil also moved lower. Conversely, the index for residential electric power moved up 1.2 percent. Prices for pharmaceutical preparations and for fresh and dry vegetables also advanced. (See table 4.)

Final demand services: The index for final demand services decreased 0.2 percent in January, the first decline since falling 0.3 percent in September 2014. In January, prices for final demand services less trade, transportation, and warehousing moved down 0.4 percent, and the index for final demand transportation and warehousing services dropped 0.8 percent. In contrast, margins for final demand trade services advanced 0.5 percent. (Trade indexes measure changes in margins received by wholesalers and retailers.)

Product detail: In January, a major contributor to the decline in the index for final demand services was prices for outpatient care (partial), which fell 0.7 percent. The indexes for automotive fuels and lubricants retailing; securities brokerage, dealing, investment advice, and related services; television, video, and photographic equipment and supplies retailing; mining services; and truck transportation of freight also decreased. Conversely, margins for apparel, jewelry, footwear, and accessories retailing advanced 3.6 percent. The indexes for

machinery, equipment, parts, and supplies wholesaling and for loan services (partial) also increased.

Special grouping, Final demand less foods, energy, and trade: The index for final demand less foods, energy, and trade services moved down 0.3 percent after edging up 0.1 percent in December. For the 12 months ended in January, prices for final demand less foods, energy, and trade services climbed 0.9 percent.

Intermediate Demand by Commodity Type

Processed goods for intermediate demand: The index for processed goods for intermediate demand fell 2.8 percent in January, the largest decline since a 4.1-percent drop in December 2008. More than half of the broad-based January decrease is attributable to prices for processed energy goods, which moved down 8.3 percent. In addition, the index for processed materials less foods and energy fell 1.3 percent, and prices for processed foods and feeds declined 2.5 percent. For the 12 months ended in January, the index for processed goods for intermediate demand moved down 5.5 percent, the largest 12-month drop since a 7.7-percent decrease in October 2009. (See table B.)

Product detail: In January, a 19.2-percent decline in diesel fuel prices was a major factor in the decrease in the index for processed goods for intermediate demand. Prices for basic organic chemicals, gasoline, jet fuel, plastic resins and materials, and dairy products also moved lower. In contrast, the electric power index increased 1.3 percent. Prices for basic inorganic chemicals and formula feeds also advanced. (See table 5.)

Unprocessed goods for intermediate demand: The index for unprocessed goods for intermediate demand fell 9.4 percent in January, the largest drop since a 13.2-percent decrease in November 2008. About 90 percent of the broad-based decline in January can be traced to prices for unprocessed energy materials, which decreased 23.6 percent. The index for unprocessed foodstuffs and feedstuffs moved down 1.8 percent, and prices for unprocessed nonfood materials less energy fell 0.7 percent. For the 12 months ended in January, the index for unprocessed goods for intermediate demand declined 18.4 percent, the largest 12-month drop since a 31.7-percent decrease in September 2009.

Product detail: More than half of the January decline in the index for unprocessed goods for intermediate demand is attributable to prices for crude petroleum, which fell 30.6 percent. Prices for natural gas, slaughter hogs, raw milk, grains, and nonferrous scrap also moved lower. Conversely, the index for slaughter poultry rose 5.5 percent. Prices for unprocessed finfish and gold ores also advanced.

The decline in January was led by the index for services less trade, transportation, and warehousing for intermediate demand, which dropped 0.4 percent. Prices for transportation and warehousing services for intermediate demand fell 0.3 percent. In contrast, the index for trade services for intermediate demand rose 0.7 percent. (See table C.)

Product detail: In January, prices for securities brokerage, dealing, investment advice, and related services declined 4.5 percent. The indexes for television advertising time sales, radio advertising time sales, legal services, marketing consulting services, and truck transportation of freight also decreased. Conversely, margins for parts and supplies for machinery and equipment wholesaling advanced 1.0 percent. The indexes for business loans (partial) and staffing services also increased.

Intermediate Demand by Production Flow

Stage 4 intermediate demand: The index for stage 4 intermediate demand moved down 0.7 percent in January, the fifth consecutive decline. In January, prices for total goods inputs to stage 4 intermediate demand decreased 1.3 percent. The index for total services inputs was unchanged. (See table D.) Lower prices for diesel fuel; gasoline; securities brokerage, dealing, investment advice, and related services; basic organic chemicals; dairy products; and asphalt outweighed increases in the indexes for business loans (partial), electric power, and parts and supplies for machinery and equipment wholesaling. (See table 6.) For the 12 months ended in January, prices for stage 4 intermediate demand fell 0.5 percent.

Stage 3 intermediate demand: Prices for stage 3 intermediate demand fell 2.4 percent in January, the fourth straight decrease. In January, the index for total goods inputs to stage 3 intermediate demand dropped 4.2 percent, and prices for total services inputs edged down 0.1 percent. Falling prices for gasoline; jet fuel; basic organic chemicals; slaughter hogs; diesel fuel; and securities brokerage, dealing, investment advice, and related services outweighed increases in the indexes for slaughter poultry, business loans (partial), and unprocessed finfish. For the 12 months ended in January, the index for stage 3 intermediate demand fell 3.3 percent.

Stage 2 intermediate demand: The index for stage 2 intermediate demand dropped 5.0 percent in January, the eleventh consecutive decline. In January, prices for total goods inputs to stage 2 intermediate demand fell 9.8 percent, and the index for total services inputs moved down 0.5 percent. Lower prices for crude petroleum; gas fuels; plastic resins and materials; securities brokerage, dealing, investment advice, and related services; basic organic chemicals; and lubricating oil base stocks outweighed increases in the indexes for staffing services, formula feeds, and basic inorganic chemicals. For the 12 months ended in January, prices for stage 2 intermediate demand dropped 11.0 percent.

Stage 1 intermediate demand: The index for stage 1 intermediate demand declined 3.3 percent in January, the fifth straight decrease. In January, prices for total goods inputs to stage 1 intermediate demand dropped 5.7 percent. The index for total services inputs was unchanged. Lower prices for basic organic chemicals; diesel fuel; gasoline; crude petroleum; gas fuels; and securities brokerage, dealing, investment advice, and related services outweighed advances in the indexes for business loans (partial), electric power, and chemicals and allied products wholesaling. For the 12 months ended in January, the index for stage 1 intermediate demand decreased 6.3 percent.

NOTE: Some of the percent changes shown here and elsewhere in this release may differ from those previously reported because seasonal adjustment factors have been recalculated to reflect developments during 2014. Recalculation of Seasonal Adjustment Factors

Effective with this report, seasonal adjustment factors have been recalculated to reflect price-movement patterns during 2014 for the Final Demand-Intermediate Demand (FD-ID) System and commodity-grouping indexes. This routine annual recalculation may affect previously published seasonally adjusted indexes and percent changes for January 2010 through December 2014.

Revised seasonally adjusted data for this period, as well as seasonal adjustment factors for directly adjusted commodity indexes to be used through December 2015, were released February 13, 2015. To obtain this information, contact

the Division of Industrial Prices and Price Indexes, Section of Index Analysis and Public Information at ppi-info@bls.gov or (202) 691-7705, or visit the Producer Price Index homepage at www.bls.gov/ppi.

Tables E and F below provide monthly seasonally adjusted percent changes for major FD-ID system indexes in 2014, based on former and recalculated seasonal factors. These percent changes include final price data through August 2014 and may differ from values shown in tables A through D of this report, which include final price data through September 2014.

PPI Updates Commodity Weight Allocations for the Final Demand–Intermediate Demand Aggregation Structure

Effective with this report, the Bureau of Labor Statistics (BLS) updated the weight allocations used to calculate its Final Demand–Intermediate Demand (FD–ID) producer price indexes (PPI). This update more accurately reflects recent sales patterns. The PPI weights are based on shipment values from the 2007 economic census. However, BLS changed the proportion of these weights allocated to the various FD–ID categories. Data published in the 2007 Input–Output (I–O) Accounts from the Bureau of Economic Analysis (BEA) provide the basis for the new allocations. This update affects all portions of the PPI FD–ID system: final demand indexes, intermediate demand by commodity type indexes, and intermediate demand by production flow indexes. This article first discusses commodity types among final demand and intermediate demand by commodity type together and then describes updates to the intermediate demand by production flow indexes.¹

It is important to note that the allocation update does not change the PPI classification system, reference base, or aggregation structure. The update does cause some significant, though not unexpected, shifts in the relative importance of component series in the FD–ID system. Appendix A of this report presents some of these more noteworthy shifts.

Final Demand and Intermediate Demand by Commodity Type Methodology

The primary data source used in the weight allocations of the PPI commodity FD–ID indexes by commodity type is the “Use of commodities by industries, before redefinition” table (hereafter known as the use table).² The use table shows—for each commodity group—the dollar value (in millions of dollars at producers’ prices) used by each industry and final user.

BLS analysts convert these dollar values of use to percentages and sum them to 100 percent for each I–O commodity group. Analysts truncate individual values of less than 0.5 percent and normalize the residual values.

BLS analysts then determine the FD–ID categories that correspond to the uses of each commodity group in the I–O table. Next, analysts analyze each detailed record on the I–O table and assign it to one or more of the detailed FD–ID codes. These assignments combine information about the type of use indicated in the table and use informed judgment by BLS analysts relating to definitions of the FD–ID categories. The next section of this article includes these definitions. Only the lowest level FD–ID codes are used in the assignment process. Analysts do not make direct assignments to the higher level FD–ID codes (for example, FD4– Final Demand). These higher level indexes are calculated through aggregation of the lower level FD–ID indexes.

To make the FD–ID assignments, the analyst determines

1. What is the product (transportation service, food, fuel, capital equipment, trade service, unprocessed material input, processed material input, etc.)?
2. In what manner will this product be used by the consuming industry or user?

Analysts use the combined answer to these questions to determine the appropriate FD–ID code assignment. Often, the same product will fall into different FD–ID categories, depending on its use. For example, fresh fruit purchased by households is considered a Crude Finished Consumer Food (FD41113), while the same fruit purchased by a food company for canning is considered an Unprocessed Foodstuff and Feedstuff (ID621).

BLS analysts assign FD–ID weight allocations at the PPI 6-digit commodity group level, because this is the level used for building the lowest level FD–ID indexes. In the next step, analysts match the 6-digit PPI codes with I–O codes in the BEA use table. They use a concordance between the PPI and the North American Standard Industrial Classification System (NAICS). BEA I–O data are generally classified according to NAICS. BEA provides a concordance between the NAICS and the I–O industry and commodity codes, which further enhances the match. Next, BLS analysts apply the percentage allocations by FD–ID for each PPI 6-digit code to the total value weight of the 6-digit commodity. The resultant products are used in their respective FD–ID aggregations for index calculation. Relative importances are then calculated for component 6-digit series in the PPI by FD–ID.³

Final Demand and Intermediate Demand by Commodity Type Structure and Definitions

Inherent in the Final Demand–Intermediate Demand by Commodity Type categorization are the concepts of type of buyer and type of commodity. The two main buyer types are final-demand buyers and intermediate-demand buyers. Final-demand buyers include consumers, government, foreigners, and domestic industries that purchase the commodity as capital investment. Intermediate demand buyers consist of domestic industries that purchase the commodity as an input to production, excluding capital investment.

The four main type of commodities are unprocessed goods, processed goods, services, and construction. Unprocessed goods are goods that have undergone no fabrication. For PPI purposes, unprocessed goods can be subject to picking, sorting, washing, packing, or transporting. Processed goods include goods that have been subjected to a treatment or series of treatments that in some way alters the initial physical nature or function of the goods. Mixing goods or assembling components is considered processing because,

although the good itself is not changed, its function or usefulness is altered. Services include trade services; transportation and warehousing services; and services excluding trade, transportation, and warehousing. Trade services encompass both retailing and wholesaling services. The PPI views wholesalers and retailers as suppliers of distributive services (rather than as suppliers of goods), because little, if any, transformation of these goods takes place. This approach implies that the output of a wholesale or retail trade establishment is represented by the difference between its selling price of a good and the acquisition price for that same item. Gross margin prices, as collected by PPI, reflect the value added by the establishment for services such as marketing, storing, and displaying goods in convenient locations and making the goods easily available for customers to purchase. Transportation services include transportation of passengers, transportation of cargo, services related to transportation, and warehousing and storage of goods. Services less trade, transportation, and warehousing include all other types of services, such as health care services, professional services, financial services, entertainment services, etc. Finally, construction encompasses the creation and maintenance and repair of buildings or other engineering projects.

The Final Demand–Intermediate Demand (by commodity type) system consists of five major portions differentiated by the type of commodity and class of buyer. The five major FD–ID categories are processed goods for intermediate demand; unprocessed goods for intermediate demand; services for intermediate demand; construction for intermediate demand, and final demand.

Processed goods for intermediate demand include fabricated goods purchased by businesses as inputs to production, excluding capital investment. Unprocessed goods for intermediate demand are goods that have undergone no fabrication and are purchased by businesses as inputs to production. Services for intermediate demand include trade services; transportation and warehousing services; and services less trade, transportation, and warehousing purchased by businesses as inputs to production. Construction for intermediate demand includes maintenance and repair construction purchased by businesses. Final demand include all types of commodities (goods, services, and construction) consumed as personal consumption, by government, by businesses as capital investment, and as exports.

The full Final Demand–Intermediate Demand by Commodity Type structure is provided below. Direct weight allocations are made to the FD–ID categories which are italicized. Definitions of the detailed indexes follow the listing of their respective structure.

Intermediate Demand by Production Flow Methodology

The intermediate demand by production flow portion of the FD–ID system reorganizes into four stages of production the same set of intermediate demand commodities included in the intermediate demand by commodity type portion of the system. The stages are developed such that commodities in one stage are used as inputs to produce commodities in the next stage. The stage-based treatment of intermediate demand allows data users to study price transmission relationships between the intermediate stages of production as well as the relationship to final demand.

To construct the intermediate demand by production flow indexes, a five-step procedure is followed. The procedure utilizes both BEA “Make of commodities by industries” and “Use of commodities by industries, before redefinition” tables. Both tables are included in the *Benchmark Input–Output Accounts of the United States, 2007*, published by BEA. As stated earlier, “Use of commodities by industries, before redefinition” shows—for each commodity group—the dollar value (in millions of dollars at producers’ prices) used by each industry and final user. The “Make of commodities by industries” table indicates the dollar value (in millions of dollars at producers’ prices) of each commodity made by each industry.

The first step in the procedure is to determine the total production of each industry in the economy. In general, industries are classified as primary producers of specific goods or services; however, industries may also be secondary producers of other goods or services. A firm classified in the automobile industry, for example, produces primarily automobiles, but the same firm may also produce and sell additional commodities, such as car parts, scrap metal, or car rentals. These additional commodities are classified as secondary production. The first step therefore requires determining both the primary production and secondary production of each industry in the economy. The 2007 BEA “Make of commodities by industries” table was used for this purpose.

The second step is to ascertain where the total output of each industry is consumed. This step requires determining, for each industry, the portion of the industry output consumed as final demand and the portion consumed as intermediate demand. For the intermediate-demand portion, determining which specific industries are consuming the industry’s output also is required. BEA 2007 “Use of commodities by industries, before redefinition” data were employed to make this determination.

The third step in developing stages is to assign industries to stages of production. Within a stage-based system, transactions can be classified as forward flow, backflow, or internal flow. Forward flow occurs when an industry sells its output to an industry classified in a forward stage of production

(to be used as an input) or to final demand. Internal flow occurs when an industry sells its output to be used as an input by another industry classified within the same stage of production. Backflow occurs when an industry sells its output to be used as an input by an industry classified in an earlier stage of production in the system. To successfully develop a forward-flowing system of price change, industries should be assigned to stages in a manner that minimizes backflow and internal flow while maximizing forward flow within the system. Towards this end, PPI assigned all industries included in the BEA I–O tables to stages in a manner that attempted to maximize net forward flow of the system. Net forward flow is defined as:

$$\text{Net forward flow} = (\text{forward shipments of the industry stage} + \text{inputs received from previous stages of process}) - (\text{backward shipments of the industry stage} + \text{inputs received from forward stages of process})$$

The PPI program implements a two-step procedure to attempt to maximize net forward flow. In the first step, a set of rules is used to assign industries to stages and select the appropriate number of stages for the system. The system that the PPI program eventually chose is a four-stage system. The set of rules used to assign industries to the four stages is summarized as follows:

- Assign industry to stage 4 if shipments sold to final demand ≥ 75 percent of industry production.
- Assign industry to stage 3 if shipments sold to final demand and to stage 4 ≥ 75 percent of industry production and shipments sold to final demand < 75 percent of production.
- Assign industry to stage 2 if shipments sold to final demand, to stage 4, and to stage 3 ≥ 60 percent of industry production; and shipments sold to final demand and to stage 4 < 75 percent of production; and shipments sold to final demand < 75 percent.
- Assign industry to stage 1 if it does not meet the conditions of stage 4, 3, or 2.

Before selecting the number of stages and set of rules just described, the PPI program examined many different sets of rules and numbers of stages. It eventually chose the aforementioned system because it maximized net forward flow as compared with other sets of rules examined.⁴

After the assignment of industries to stages by use of the aforementioned rules, the second step in the procedure to maximize net forward flow was to examine the effects on net forward flow of moving individual industries to stages to which they were not originally assigned. In cases in which there were substantial gains to net forward flow, industries were left in the new stage.

The PPI production-flow-based system exhibits strong forward flow and little backflow: 83.7 percent of transactions in the system are forward flowing, 5.6 percent are back flowing, and 10.7 percent are internally flowing.

The fourth step in constructing the production-flow-based intermediate demand indexes is to determine the commodities to be included and weights to be used in the intermediate demand indexes. The four main indexes in the production flow system are stage 1 intermediate demand, stage 2 intermediate demand, stage 3 intermediate demand, and stage 4 intermediate demand. These indexes track prices for the *inputs* consumed by industries in each of the four stages of production. They do not track prices for the *output* produced by industries in each of the four stages of production. For example, the stage 4 intermediate demand index tracks price change for inputs consumed by industries included in the fourth stage of production. Recall that industries classified in the fourth stage of production mostly produce goods sold to final demand. The stage 4 intermediate demand index therefore measures price change in the inputs to production of industries that produce primarily final-demand commodities.

The BEA “Use of commodities by industries, before redefinition” table is used to determine the set of commodities consumed by industries in each of the four stages. The use table indicates the commodities consumed by industries in terms of BEA I–O codes. Since FD–ID indexes are constructed from PPI 6-digit commodity group level indexes, BEA I–O codes are matched to 6-digit PPI codes through use of a concordance between the PPI commodity codes and BEA I–O data. In the end, through the BEA “Use” table and the PPI/I–O concordance, the set of 6-digit PPI commodities consumed by each stage is determined, and these are the commodities that compose each of the four stages of intermediate demand in included in the production flow model.

The final step in developing the production flow indexes is to convert the indexes from gross weighted indexes to net weighted indexes. Net weighting is accomplished by removing transactions in which an input is both produced and consumed within a given stage. Net weighting eliminates multiple counting of price change from the production flow price indexes. Net weights are developed using both the BEA “Use of commodities by industries” and “Make of commodities by industries” tables.

Appendix B, Table 1 presents the updated industry stage assignments based on 2007 I–O data. Appendix B, Table 2 presents shifts in industry stage assignments between 2002 and 2007 I–O data.

To examine industry shifts resulting from the FD-ID allocation update, the following table compares previous industry stage assignments, based 2002 I-O data, with the current assignments, based on 2007 I-O data. The 2007 I-O data include 386 industries, and of these industries, 312 are comparable with industries included in the 2002 I-O list. The remaining 74 noncomparable industries are included in the 2007 I-O list but not in the 2002 I-O data. Noncomparable industries are indicated by an NA in the 2002 assignment column. Of the 312 comparable industries, 231 (approximately 75 percent) are assigned to the same stage on the basis of 2007 I-O data as they were in on the basis of 2002 data. Of the 81 industries that shifted stages, 71 shifted one stage, 9 shifted two stages, and one shifted three stages.

¹ For a detailed description of the FD-ID system as well as other information pertaining to the system, please visit

<http://www.bls.gov/ppi/fdidaggregation.htm>.

² This table is found in [Benchmark Input-Output Accounts of the United States, 2007](#), published by BEA.

³ In many cases, the same commodity is purchased by different buyer types, so commodities are often included in several FD-ID indexes. For example, regular gasoline is purchased for personal consumption, export, government use, and business use. The PPI program publishes only one commodity index for regular gasoline, reflecting sales to all types of buyers. It is this index that is used in all FD-ID aggregations, regardless of whether the gasoline is sold for personal consumption, as an export, to government, or to businesses, with differences accounted for in the applicable weights to each aggregate FD or ID index. In some cases, buyer type is an important price determining characteristic and results in commodity indexes being created on that basis. For example, within the PPI category for loan services, separate indexes for consumer loans and business loans were constructed. In this case, the commodity index for consumer loans would be included in the final-demand index, and the commodity index for business loans would fall under intermediate demand.

⁴ For a detailed description of the methodology used to develop the PPI production flow model based on 2002 I-O data, see

<http://www.bls.gov/ppi/expaggbeadata.pdf>.

Resampling of Industries

Effective with this report, the Producer Price Index (PPI) includes data for 28 resampled industries classified according to the 2012 North American Industry Classification System (NAICS). The Bureau of Labor Statistics periodically updates the sample of producers providing data for the PPI to reflect current conditions more accurately when the structure, membership, technology, or product mix of an industry shifts. The first results of this systematic process were published in

July 1986. Subsequent efforts have been completed at 6-month intervals.

For information on specific index additions, deletions, and recodes effective this month, see the January 2015 issue of the *PPI Detailed Report* online at www.bls.gov/ppi/ppidr201501.pdf, or contact the PPI's Section of Index Analysis and Public Information at ppi-info@bls.gov or (202) 691-7705.

PPI Updates Industry Net Output Ratios

Effective with this report of this report, the Producer Price Index (PPI) program has updated the net output ratios used to calculate industry indexes based on the North American Industry Classification System (NAICS). With this update, net output ratios are based on 2007 Input-Output Account data from the Bureau of Economic Analysis (BEA) of the U.S. Department of Commerce. Net output ratios represent the proportion of an industry's or industry grouping's

output consumed outside its respective area. Prior to this update, net output ratios for calculating NAICS-based PPIs reflected values from BEA 2002 Input-Output Accounts. This update does not affect commodity-grouping indexes from the PPI.

PPI Updates Inputs to Industry Indexes

Effective with the release of Producer Price Index (PPI) data for January 2015 on February 18, 2015, the Bureau of Labor Statistics updated the weights used to calculate the PPI industry input indexes. BLS also applied improved methods to the industry input indexes and expanded the number of industries for which these indexes are calculated.

These updates resulted in several changes to table 14 of this publication. That table previously only presented data for material and supply inputs to construction industries. Since 1986, BLS has published indexes for material and supply inputs to construction industries. In July 2014, BLS also began publishing experimental input indexes for the following industries:

- Paint and coating manufacturing
- Automobile manufacturing
- Offices of health practitioners
- Membership associations and organizations.

In January 2015, BLS started publication of additional input indexes for the following industries:

- Plastics products manufacturing
- Mining and oil and gas field machinery manufacturing
- Airplane manufacturing
- Ship building and repairing
- Truck transportation

While BLS has always calculated the input indexes for these nine industries using the methods described in the next section of this article, beginning with January 2015 data, the input indexes for construction industries also reflect the new methodology.

Methodology and weighting. Industry input indexes measure the average change in prices for domestic inputs consumed by industries; these indexes exclude capital investment and labor. BLS determines the products to include in an industry input index based on the Bureau of Economic Analysis (BEA) “[Use](#)

[of Commodities by Industries](#)” table. This table provides, on an industry by industry basis, the set and dollar value of products that each domestic industry consumes during production.¹ BLS calculates weights for each commodity in an industry input index based on this table and revenue data from the U.S. Census Bureau. The gross weight of each commodity in an industry input index equals the share of the total commodity’s value consumed by the industry, multiplied by the Census revenue for that commodity. BLS then converts the gross weight to a net weight by removing the portion of the input commodity’s value that was produced by the industry. BLS uses the BEA “[Make of Commodities by Industries](#)” table to determine the portion of the commodity’s value that is produced by the industry.

Prior to the January 2015 PPI release, weights for industry input indexes were based on 2002 data from the BEA Input-Output Accounts and 2007 economic census data from the U.S. Census Bureau. BLS has updated to 2007 the portion of the industry input index weights derived from the BEA Input-Output Accounts. The portion of the weights derived from census data will continue to be based on 2007 information.²

Since 1986, BLS has calculated the input indexes for construction industries from industry-based primary product PPIs. These industry-based indexes approximated commodity-based producer price indexes. (Commodity indexes track price change for goods and services regardless of the industry of origin.) The industry input indexes for construction and all other industries now are calculated from commodity-based producer price indexes. It is more appropriate to use commodity indexes than industry indexes because industries consume commodities as inputs to production.

Also since 1986, the input indexes for construction industries only included goods. With the publication of January 2015 data, all industry input indexes include services and construction inputs, in addition to goods inputs.

Coverage and Publication Structure. As of January 2015, BLS publishes input indexes for the industries shown in Table 1.

The long-standing indexes for material and supply inputs to construction industries will remain intact. Titles and index codes have changed to conform to the new table structure. New indexes capture specific goods inputs, and overall and detailed services inputs. Appendix A provides a title and coding concordance between the historical inputs to construction industries indexes and their successor indexes within the updated table structure.

Availability. PPI industry input indexes data are available in table 14 of this publication or through our [data-retrieval tools](#). For help retrieving data or for additional information, email ppi-info@bls.gov or call the Division of Industrial Prices and Price Indexes, Section of Index Analysis and Public Information, at (202) 691-7705.

¹ BLS uses a 0.5-percent cutoff rule for determining the products to include in an industry input index. Products that comprised less than 0.5 percent of the total inputs to the industry were excluded from the index. The 0.5-percent cutoff significantly reduces the work of building and maintaining the industry input indexes; research shows that the truncated inputs have almost no effect on index movements. BLS uses a similar 0.5-percent cutoff to construct the Final Demand-Intermediate Demand indexes.

¹ Further information about the Final Demand-Intermediate Demand Aggregation system is available online at <http://www.bls.gov/ppi/fddiaggregation.htm>.

² Comprehensive relative importance figures are initially computed after the publication of December indexes and are recalculated after final December indexes are available. Individual items and subtotals may not add exactly to totals because of rounding differences.

³ The indexes for September 2014 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

⁴ PPI defines Total finished as including only the personal consumption and private capital investment portions of final demand.

⁵ Trade indexes measure changes in margins received by wholesalers and retailers.

⁶ The PPI definition of foods does not include food and beverages for immediate consumption. PPI defines food and beverages for immediate consumption as the service of preparing meals, snacks, and beverages to customer order for immediate on-premises and off-premises consumption.

⁷ Distributive services include transportation, warehousing, and trade of goods.

¹ Further information about the Final Demand-Intermediate Demand Aggregation system is available online at <http://www.bls.gov/ppi/fdidaggregation.htm>

² Comprehensive relative importance figures are initially computed after the publication of December indexes and are recalculated after final December indexes are available. Individual items and subtotals may not add exactly to totals because of rounding differences.

³ The indexes for September 2014 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

² Due to incomplete coverage of the services sector, some services indexes in this table reflect only a portion of their wherever-provided output. These indexes are flagged using the term "partial" at the end of their titles. For more information regarding wherever-provided services indexes, go to www.bls.gov/ppi/wepnotice.htm. This webpage includes methodology documentation, a table identifying missing coverage areas for those indexes with incomplete coverage, and a concordance table between wherever-provided services indexes and Census product codes.

¹ Indexes in this table are derived from the net-output-weighted industry price indexes. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly titled indexes which are derived from traditional commodity groupings.

² The indexes for September 2014 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

³ Formerly titled "Total traditional service industries."

² Trade indexes measure changes in margins received by wholesalers and retailers.

³ PPI data for these Net Inputs to Industry Indexes are organized by Bureau of Economic Analysis (BEA) Industry code. The set of products included in an industry input index and the weights for each commodity included in the index are derived from the BEA's Input-Output Accounts Use of Commodities by Industry table in conjunction with U.S. Census Bureau revenue data. Technical Note

Brief Explanation of Producer Price Indexes

The Producer Price Index (PPI) of the Bureau of Labor Statistics (BLS) is a family of indexes that measures the average change over time in prices received (price changes) by producers for domestically produced goods, services, and construction. PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI). CPIs measure price change from the purchaser's perspective.

More than 10,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors. Over time, new PPIs have been introduced for products of industries in the services and construction sectors of the U.S. economy. As of January 2013, the PPI covered about 70 percent of services as measured by 2007 Census revenue, and 34 percent of construction.

More than 100,000 price quotations per month are organized into three sets of PPIs: (1) Final demand-Intermediate demand (FD-ID) indexes, (2) commodity indexes, and (3) indexes for the net output of industries and their products. The FD-ID structure organizes products by class of buyer and degree of fabrication as well as by stage of production. The commodity structure organizes products by similarity of end use or product type. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

Final Demand–Intermediate Demand Indexes

The PPI FD-ID structure measures price change for goods, services, and construction sold to final demand and to intermediate demand. The FD-ID system replaced the PPI stage-of-processing (SOP) system as PPI's primary aggregation model with the release of data for January 2014. The FD-ID model expands coverage beyond that of the SOP system through the addition of services, construction, exports, and government purchases.

Compared with finished goods under the SOP system, the PPI for final demand goods includes nearly a 50 percent expansion of coverage. This increase can be traced to the addition of government purchases and exports. For overall final demand, expansion to include final demand services represents an even larger increase in coverage. In December 2012, final demand goods were about 34.5 percent of overall final demand, final demand services were roughly 63.5 percent, and final demand construction was about 2.0 percent of final demand. Within intermediate demand, coverage of services for intermediate demand resulted in about a 45 percent increase in coverage of the intermediate demand portion of the economy.

FD-ID indexes are constructed from commodity-based producer output price indexes. Commodities are allocated to aggregate indexes primarily based on the type of buyer. The main source of data used to determine the type of buyer is the "Use of commodities by industries, before redefinition," table

from the Benchmark Input-Output Accounts of the U.S. In many cases, the same commodity is purchased by different types of buyers. As a result, commodities are often included in several FD-ID indexes. For example, regular gasoline is purchased for personal consumption, export, government use, and business use. The PPI program publishes only one commodity index for regular gasoline (wpu057104), reflecting sales to all types of buyers, and this index is used in all aggregations regardless of whether the gasoline is sold for personal consumption, as an export, to government, or to businesses. Proportions based on BEA "Use of Commodities" data are used to allocate the correct portion of the total weight of gasoline to each use category. In cases when buyer type is an important price determining characteristic, indexes are created based on specific buyer type. For example, within the PPI category for loan services, separate indexes for consumer loans and business loans were constructed. For more information relating to the FD-ID structure, see "A new, experimental system of indexes from the PPI program" in the February 2011 *Monthly Labor Review*.

Final Demand: The final demand portion of the FD-ID structure measures price change for commodities sold for personal consumption, capital investment, government, and export. The system is composed of six main price indexes: final demand goods; final demand trade services; final demand transportation and warehousing services; final demand services less trade, transportation, and warehousing; final demand construction; and overall final demand.

The final demand goods index measures price change for both unprocessed and processed goods sold to final demand. Fresh fruits sold to consumers and computers sold for capital investment are examples of transactions included in the final demand goods price index. The final demand trade services index measures price change for the retailing and wholesaling of merchandise sold to final demand, generally without transformation. (Trade indexes measure changes in margins received by wholesalers and retailers.) The final demand transportation and warehousing services index tracks price change for transportation of passengers, as well as, transportation of cargo sold to final demand, and also includes prices for warehousing and storage of goods sold to final demand. The final demand services less trade, transportation, and warehousing index measures price change for all services other than trade and transportation sold to final demand. Publishing, banking, lodging, and health care are examples of these services. The final demand construction index tracks price change for new construction, as well as maintenance and repair construction sold to final demand. Construction of office buildings is an example of a commodity that would be included in the final demand construction index. Lastly, the overall final demand index tracks price change for all types of commodities sold to final demand by combining the five final demand component indexes described above.

Intermediate Demand: The intermediate demand portion of the FD-ID system tracks price change for goods, services, and construction products sold to businesses as inputs to

production, excluding capital investment. The system includes two parallel treatments of intermediate demand. The first treatment organizes intermediate demand commodities by type. The second organizes intermediate demand commodities into production stages, with the explicit goal of developing a forward-flow model of production and price change.

The intermediate demand by commodity type portion of the system organizes commodities by similarity of product. The system is composed of six main price indexes: unprocessed goods for intermediate demand; processed goods for intermediate demand; intermediate demand trade services; intermediate demand transportation and warehousing services; intermediate demand services less trade, transportation, and warehousing; and intermediate demand construction.

The unprocessed goods for intermediate demand price index measures price change for goods sold to businesses as inputs to production that have undergone no fabrication. Crude petroleum sold to refineries is an example of an unprocessed good sold to intermediate demand. The processed goods for intermediate demand index tracks price change for fabricated goods sold as business inputs. Examples include car parts sold to car manufacturers and gasoline sold to trucking companies. The index for trade services for intermediate demand measures price change for the services of retailing and wholesaling goods purchased by businesses as inputs to production. The intermediate demand transportation and warehousing services index measures price change for business travel, as well as, transportation and warehousing of cargo sold to intermediate demand. The intermediate demand services less trade, transportation, and warehousing index measures price change for services other than trade, transportation, and warehousing sold as inputs to production. Legal and accounting services purchased by businesses are examples of intermediate demand services excluding trade, transportation, and warehousing. Finally, the construction for intermediate demand index measures price change for construction purchased by firms as inputs to production. The index for construction for intermediate demand tracks price change for maintenance and repair construction purchased by firms.

The production flow treatment of intermediate demand is a stage-based system of price indexes. These indexes can be used to study price transmission across stages of production and final demand. This system is constructed in a manner that maximizes forward flow of production between stages, while minimizing back-flow of production. The production flow treatment contains four main indexes: intermediate demand stage 1, intermediate demand stage 2, intermediate demand stage 3, and intermediate demand stage 4.

Indexes for the four stages were developed by first assigning each industry in the economy to one of four stages of production, where industries assigned to the fourth stage primarily produce output consumed as final demand, industries in the third stage primarily produce output consumed by stage 4 industries, industries assigned to the second stage primarily produce output consumed by stage 3 industries, and industries assigned to the first stage produce output primarily consumed by stage 2 industries. The four indexes then track prices for the net inputs consumed by

industries in each of the four stages of production. The stage 4 intermediate demand index, for example, tracks price change for inputs consumed, but not produced, by industries included in the fourth stage of production. Hence, the index tracks price change in inputs to industries that primarily produce final demand commodities (stage 4 producers primarily produce commodities sold to final demand).

Examples of heavily weighted goods-producing industries in stage 4 include the manufacture of light trucks and utility vehicles, automobiles, and pharmaceuticals. Retail trade, food service and drinking places, and hospitals are examples of heavily weighted service industries included in stage 4. Stage 4 also includes all new construction industries. Examples of goods consumed by stage 4 industries include motor vehicle parts, commercial electric power, plastic construction products, biological products, and beef and veal. Engineering services, machinery and equipment wholesaling, long distance motor carrying, and legal services constitute examples of services consumed by stage 4 industries.

Examples of highly weighted goods-producing industries included in stage 3 are motor vehicle parts manufacturing, animal (except poultry) slaughtering and processing, and semiconductor manufacturing. Services industries classified in stage 3 include wholesale trade; insurance carriers; architecture, engineering, and related services; and hotels and motels. Examples of goods consumed by stage 3 industries include slaughter steers and heifers, industrial electric power, and hot rolled steel bars, plates, and structural shapes. Services commonly consumed by stage 3 industries include commissions from sales of property and casualty insurance, business loans, temporary help services, and administrative and general management consulting services.

Petroleum refineries; electricity generation, transmission, and distribution; natural gas distribution; cattle ranching and farming; and plastic materials and resin manufacturing are among the goods-based industries assigned to stage 2. Services industries that are heavily weighted in stage 2 include management of companies and enterprises; non-depository credit intermediation; insurance agencies and brokerages; and services to buildings and dwellings. Goods commonly purchased by stage 2 industries include crude oil, natural gas, formula feeds, and primary basic organic chemicals. Services that are heavily weighted in the intermediate demand stage 2 index are legal services, business loans, and cellular phone and other wireless telecommunication.

Goods producing industries in stage 1 include oil and gas extraction, paper mills, and grain farming. Real estate, legal services, and advertising services are examples of highly weighted services industries included in stage 1. Examples of goods consumed by stage 1 industries are commercial and industrial electric power and gasoline. Services commonly consumed by stage 1 industries include solid waste collection, chemicals and allied products wholesaling, and guestroom or unit rental. It should be noted that all inputs purchased by stage 1 industries are by definition produced either within stage 1 or by latter stages of processing, leaving stage 1 less useful for price transmission analysis. For additional information on industry stage assignments, see <http://www.bls.gov/ppi/industryflowstage.htm>.

Comparing the PPI with CPI

Although some data users utilize the PPI as a potential indicator of the Consumer Price Index (CPI), there are many reasons why the PPI and the CPI may diverge. The scope of the personal consumption portion of the PPI includes all marketable output sold by domestic producers for households. The scope of the CPI includes goods and services provided by business or government, where explicit user charges are paid by consumers. For example, the most heavily weighted item in the CPI, owners' equivalent rent, is excluded from the PPI. The scope of the CPI includes imports. The PPI excludes imports. The CPI only includes components of personal consumption directly paid for by the consumers, while the PPI includes components of personal consumption that may not be paid for by consumers. For example, the PPI includes medical services paid for by third parties. In contrast to CPI, PPI does not completely cover services. PPIs exclude taxes, since they do not represent producer revenue. Conversely, sales and other taxes paid by consumers are part of household expenditure and are included in the CPI. Additional technical differences between PPI and CPI also exist. For more information see "Comparing new final demand producer price indexes with other Government price indexes," *Monthly Labor Review*, January 2014, at <http://www.bls.gov/opub/mlr/>.

Commodity Indexes

The commodity classification of the PPI organizes goods, services, and construction by similarity of product or end use, disregarding industry of origin. With the release of data for July 2009, PPI expanded its commodity structure to include indexes for services and construction products. Prior to this date, the PPI commodity structure only included products from goods producing sectors. Table 9 of the *PPI Detailed Report* includes data for commodity indexes, organized in a hierarchal structure, including major groupings, subgroups, product classes, sub-product classes, and individual items.

Industry Net-Output Price Indexes

PPIs for the net output of industries and their products are grouped according to the North American Industry Classification System (NAICS). Prior to the release of January 2004, industry-based PPIs were published according to the Standard Industrial Classification (SIC) system. Industry price indexes are compatible with other economic time series organized by industry, such as data on employment, wages, and productivity. Table 11 of the *PPI Detailed Report* includes data for NAICS industries and industry groups (3-, 4-, 5-, and 6-digit codes), Census product classes (7- and 8-digit codes), products (9-digit codes), more detailed sub-products (11-digit codes), and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product categories. Every industry has primary product indexes that show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products make up a plurality of its total shipment value. In

addition, most industries have secondary product indexes that show changes in prices received by establishments for products chiefly made in some other industry. Some industries have miscellaneous receipts indexes that track price changes for other sources of revenue received by establishments within the industry that are not derived from sales of their products; for example, resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Data Collection

PPIs are constructed using selling prices reported by establishments of all sizes, selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms also are chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices submitted by survey respondents are effective on the Tuesday of the week containing the 13th day of the month. The survey is conducted via Internet, mail, and fax.

Price data are provided on a voluntary and confidential basis; only sworn BLS employees are allowed access to individual company price reports. BLS publishes price indexes instead of actual prices. All PPIs are subject to revision 4 months after original publication to reflect the availability of late reports and corrections by respondents.

BLS periodically updates the PPI sample of survey respondents to better reflect current conditions when the structure, membership, technology, or product mix of an industry shifts significantly and to spread reporting burden among smaller firms. Results of these resampling efforts are incorporated into the PPI with the release of data for January and July.

As part of an ongoing effort to expand coverage to sectors of the economy other than mining and manufacturing, an increasing number of service and construction sector industries have been introduced into the PPI. The following list of industries introduced since the mid-1990s includes the month and year in which an article describing the industry's content appeared in the *PPI Detailed Report*.

Weights

Weights for most commodity groupings of the PPI, as well as, weights for commodity-based aggregate indexes calculated from commodity groupings, such as FD-ID indexes, currently reflect 2007 values of shipments as reported in the *Census of Manufactures* and other sources. From January 2007 to December 2011, PPI weights were derived from 2002 shipment values. Industry indexes now are calculated under the 2012 NAICS structure utilizing 2007 value of shipment weights and 2002 net output ratios. The periodic update of the value weights used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments within the industry to buyers outside the industry. However, weights for commodity indexes are based on gross shipment values, including values of shipments between establishments within the same industry. As a result, broad commodity grouping indexes, such as the PPI for All Commodities (which is composed of major commodity groupings 01 through 15), are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. The intermediate demand by commodity type FD-ID indexes partially correct for this defect, but industry indexes, final demand FD-ID indexes, and intermediate demand by production flow FD-ID indexes consistently correct for this at all levels of aggregation. Therefore, industry and FD-ID indexes are more appropriate than broad commodity groupings for analysis of general price trends.

Price Index Reference Base

Effective with publication of January 1988 data, many important PPI series (including most commodity groups and individual items) were placed on a new reference base, 1982 = 100. From 1971 through 1987, the standard reference base for most PPI series was 1967 = 100. Except for rounding differences, the shift to the new reference base did not alter any previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The 1982 reference base is not used for commodity indexes with a base

later than December 1981 or for industry net output indexes and their products. The FD-ID indexes typically have a reference base of November 2009 = 100.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, “Producer Prices,” in the *BLS Handbook of Methods*. This chapter can be downloaded from the BLS Web site at www.bls.gov/opub/hom/homch14.htm.

Calculating Index Changes

Each PPI measures price changes from a reference period that equals 100.0. An increase of 5.5 percent from the reference period in the Final Demand Goods Price Index, for example, is shown as 105.5. This change also can be expressed in dollars, as follows: prices received by domestic producers of a sample of final demand goods have risen from \$100 in November 2009 to \$105.50. Likewise, a current index of 90.0 would indicate that prices received by producers of final demand goods are 10 percent lower than they were in November 2009.

Movements of price indexes from one month to another are usually expressed as percent changes, rather than as changes in index points. Index point changes are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes.

Index point change

Final Demand Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5

Index percent change

Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034×100
Equals percent change	3.4

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, BLS publishes seasonally adjusted and unadjusted changes each month. Seasonally adjusted data are preferred for analyzing general price trends in the economy because these data eliminate the effect of changes that normally occur at about the same time, and in about the same magnitude, every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying trends. Unadjusted data are of primary interest to users who need information that can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited when escalating long-term contracts

such as purchasing agreements or real estate leases. For more information, see *Escalation Guide for Contracting Parties*, on the Web at www.bls.gov/ppi/ppiescalation.htm.

In 1998, the PPI implemented the X-12-ARIMA Seasonal Adjustment Method; prior to that year, PPI employed the X-11 method. Each year, the seasonal status of most commodity indexes is reevaluated to reflect more recent price behavior. Industry net output indexes are not seasonally adjusted. For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data from the prior 5 years. Updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or an aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than does the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for FD-ID indexes are derived indirectly through an aggregative method that combines movements of a wide variety of subproduct class (six-digit) series.

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it; if the pattern keeps shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products, but has more often affected manufactured products such as automobiles and steel.

Since January 1988, the PPI has used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of almost 300 seasonally adjusted series, only 31 were subject to intervention in 2013.

For more information relating to seasonal adjustment methods, see “Summary of Changes to the PPI’s Seasonal Adjustment Methodology” in the January 1995 issue of *Producer Price Indexes*, and “PPI and CPI Seasonal Adjustment: an Update” in the July 2010 *Monthly Labor Review*.

Producer Price Index Data on the Internet

In 1995, the BLS began posting PPI series, news releases, and technical information to both a World Wide Web (WWW) site and a file transfer protocol (FTP) site. During the years following the introduction of PPI Internet services, use of these sites eclipsed more traditional methods of data dissemination, such as subscriptions to the *PPI Detailed Report*. There were more than 5 million instances of PPI data

and tables being downloaded from the Internet during the 12 months ended December 31, 2012.

Retrieving PPI data from the PPI Web site

PPI data can be obtained from the WWW address (www.bls.gov/ppi). On this page, under the tab labeled “Featured PPI databases” links provide the following methods of data retrieval:

- **Top Picks** is a form-based application for both Industry Data and Commodity Data that allows the user to quickly obtain PPI time series data by selecting the high-level aggregate and other commonly requested time series, including the All Commodities Index and the FD-ID indexes (for example, Final Demand). Within each list, any one—or all—of the time series shown can be selected. A user can modify the date range and output options after executing the query, using the reformat button above the data output table.
- **One-Screen Data Search and Multi-Screen Data Search** are form-based query applications for both Industry Data and Commodity Data designed for users unfamiliar with the PPI coding structure. These applications guide a user through the PPI classification by listing index titles and do not require knowledge of commodity or industry codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. Two options are available to create customized tables, depending on a user’s browser capability. The one-screen option is a JavaScript application that uses a single screen to guide a user through the available time series data. The second option is a multiple-screen, non-Java-based application. Both methods allow a user to browse the PPI coding structure and select multiple series. Users can modify the date range and output options after executing the query using the reformat button above the data output table.
- **Series Report** is a form-based application that allows users to input multiple, formatted PPI time series identifiers (commodity or industry codes) as inputs in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for users who are familiar with the format of PPI time series identifiers. There are five alphabetic prefixes used to create unique PPI time series identifiers: WP, WD, PC, PD, and ND. Each provides the user access to a different PPI database. Adding either a “u” (not seasonally adjusted) or an “s” (seasonally adjusted) to the end of these prefixes further specifies the type of data needed.

EXAMPLES

For commodity and FD-ID indexes, series identifiers combine a “wpu” prefix (not seasonally adjusted) or a

“wps” prefix (seasonally adjusted) with a commodity code.

<u>Commodity code</u>	<u>Provides data for:</u>
wps141101	Passenger cars, seasonally adjusted
wpu141101	Passenger cars, not seasonally adjusted
wpu4	Final demand, not seasonally adjusted
wpsid63	Services for intermediate demand, seasonally adjusted

For discontinued commodity indexes, series identifiers combine a “wdu” prefix (not seasonally adjusted) or a “wds” prefix (seasonally adjusted) with a commodity code.

<u>Commodity code</u>	<u>Provides data for:</u>
wds019	Other farm products, seasonally adjusted
wdu0635	Preparations, ethical (prescription), not seasonally adjusted
wdusi138011	Stainless steel mill products, not seasonally adjusted

Current price indexes grouped by industry according to NAICS have series identifiers that begin with the prefix “pcu.” After the prefix, there are 12 digits (the 6-digit industry code is listed twice) followed by up to 7 alphanumeric characters identifying product detail. Dashes are used as placeholders for higher-level industry group codes.

<u>Industry-product code, current NAICS series</u>	<u>Provides data for:</u>
pcu325---325---	Chemical manufacturing
pcu336110336110	Automobile and light duty motor vehicle manufacturing
pcu621111621111411	Offices of physicians, one- and two-physician practices and single-specialty group practices, general/family practice

Discontinued industry-product codes based on SIC combine a “pdu” prefix and “#” between the fourth and fifth characters of the product code. Series identifiers for the discontinued dataset use underscores as placeholders to complete a reference to an SIC industry group code of fewer than four digits. (All PPI industry-based indexes organized by SIC were discontinued with the introduction of NAICS in 2004.)

<u>Industry-product code, discontinued SIC series</u>	<u>Provides data for:</u>
pdu28_#	Chemicals and allied products
pdu331_#	Blast furnaces, steel works, and rolling and finishing mills
pdu3711#111	Passenger cars

Price indexes for discontinued series grouped by industry according to NAICS have identifiers that begin with the prefix “ndu.” After the prefix, there are 12 numeric digits (the 6-digit industry code is listed twice), and up to 7 additional alphanumeric characters that identify product detail. Dashes are used as placeholders for higher-level group codes.
