

Supplement to Producer Price Indexes Data for 1985

U.S. Department of Labor
Bureau of Labor Statistics
July 1986

Producer Price Indexes is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights. A subscription may be ordered from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

The Secretary of Labor has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through July 31, 1987. Second-class postage paid at Laurel, Md. Material in this publication is in the public domain and may be reproduced without permission of the Federal Government. Please credit the Bureau of Labor Statistics.

July 1986

Preface

This annual supplement to *Producer Price Indexes* presents monthly indexes and annual averages for 1985, including price indexes for the net output of selected industries and their products, as calculated with the methodology of the Producer Price Index Revision (PPIR). This report also contains historical annual indexes for selected stage-of-processing groupings. In most cases, data in this supplement are the same as revised data published in successive monthly

issues of this periodical. This supplement also provides information on the relative importance of index components at the end of the year.

Information on changes in the sample for Producer Price Indexes is no longer being published in the annual supplement. Such information can be found in the July 1985 and January 1986 issues.

Monthly Indexes and Annual Averages for Producer Price Indexes, 1985

Tables 1 through 10 present 1985 monthly indexes and annual averages for all categories covered under the Producer Price Index (PPI) program, including series calculated under the survey for the Producer Price Index Revision (PPIR). Data shown in this supplement are the final, revised data published in successive monthly issues of *Producer Price Indexes*. (All monthly data are subject to revision 4 months after original publication.) Data shown here are not seasonally adjusted.

The continued implementation of the PPI Revision program resulted in several major enhancements during 1985. In January, indexes were first published for higher-level industry groups, i.e., those with 2- and 3-digit Standard Industrial Classification (SIC) codes. These aggregated indexes (included in table 3 of this supplement) greatly facilitate comparisons of PPI data with other economic measures using the SIC system, such as data for wages and productivity. For a further description of the higher-level SIC indexes, see page 4 and 5 of *Producer Price Indexes* Data for January 1985 and page 6 of *Producer Price Indexes* Data for January 1986.

Indexes for the refined petroleum industry were substantially improved in 1985. The 1-month lag was eliminated in mid-1985, thereby making the entire PPI more timely and accurate. Regional detail for these indexes was eliminated at the same time. For further information, please see the special note "Changes

in refined petroleum product indexes" on page 232 of this supplement.

Price indexes for railroad freight began to be calculated under the PPI Revision system during 1985. As a result, they appear at the end of table 3 (under SIC 4011, Railroads, line haul operations) instead of in a separate table.

The PPIR indexes reflected in supplement table 3 are designed as an improvement of, and a replacement for, the Industry-Sector Price Indexes (ISPI's) in supplement tables 7 and 8. The supplement table 3 indexes are based on a large probability sample of producers and products within the specified industries. Indexes in supplement tables 7 and 8, in contrast, are based on smaller, judgmental, commodity-oriented samples that are not restricted to establishments classified in the specified industry. Because ISPI's have not been published since December 1985, this supplement is the last time these indexes will appear in print. Historical data for the discontinued ISPI's have been incorporated into the PPIR system. This was accomplished by rebasing the old indexes to the base period of the corresponding PPIR indexes.

Table 11 presents historical annual averages for ten major stage-of-processing indexes, 1947-85. These ten categories appear in tables 1, 2, and 3 of the monthly issues, and comprise the principal groupings in which commodity price changes are analyzed. An earlier version of this table appeared in the supplement with data for 1981.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents.

* Industry and product class indexes may include products not shown separately.

* This index was introduced in midyear, and has been linked backward with a rebased PPI series. The annual average is computed from both the PPIR series and the corresponding rebased indexes for the PPI series.

* Not available.

n.e.c. = Not elsewhere classified.

mfpm = Made from purchased materials.

n.s.k. = Not specified by kind.

Note: Indexes in this table are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication. The annual average calculation method for the PPIR differs from that of the PPI (table 3). The PPIR method averages the unrounded monthly indexes, and also includes unpublished monthly data. Therefore, the annual averages may not agree with those computed by averaging the monthly indexes as shown above.

Changes in Refined Petroleum Product Indexes

Effective with data for July 1985, the Bureau of Labor Statistics (BLS) discontinued publication of average prices and regional price indexes for refined petroleum products. National price indexes for refined petroleum products classified by the traditional PPI commodity code system appear in table 4 of this supplement: price indexes for the output of the petroleum refining industry (SIC 2911) now appear in table 3, arranged by the Standard Industrial Classification.

These changes reflect a major methodological revision designed to improve the timeliness of Producer Price Index data for refined petroleum and to integrate refined petroleum more fully into the Bureau's system of industrial price measures. From February 1973 to June 1985, the refined petroleum indexes were published with a 1-month lag; for example, the Producer Price Index for February contained refined petroleum data for January. Such a lag was necessary to develop sufficient information to publish accurate regional indexes. However, the lag also caused problems in analyzing current economic movements, especially in view of the large importance of refined petroleum in the major Producer Price Indexes, such as the Finished Goods Price Index.

In 1983, the Energy Information Administration (EIA) of the U.S. Department of Energy began publication of State-level average prices for most major petroleum products. This provided an opportunity for the BLS to improve its petroleum indexes by incorporating more timely data in its national indexes. At the same time, geographically detailed average prices comparable to the discontinued

BLS series are available to users from EIA in *Petroleum Marketing Monthly* (EIA-0380) in substantially more detail.

This publication may be ordered through the National Energy Information Center, telephone (202) 252-8800, at \$4.25 for a single copy and \$47 annually (domestic). The center can also answer questions regarding Department of Energy surveys. Please note that EIA does not publish price indexes of any kind, and its regional detail does not match categories for refined petroleum products by region as published by the BLS.

Special note on data in table 5

Table 5 presents final indexes for refined petroleum products by region for the period from January through June 1985. Data for January and February have been revised in accordance with the usual 4-month revision policy to take into account late reports and corrections by respondents.

Because of the sample change in July, however, data for March through June were not subject to the usual revision cycle. Data for January through May were lagged 1 month. Data for June, however, reflect the elimination of the 1-month lag, which became effective when July data were published.

Therefore, June indexes differ from those originally published, and the index change between May and June actually reflects 2 months of price movements.

Footnotes for table 6.

¹ These indexes are calculated by combining the indexes listed below by commodity code after each special commodity grouping. The weights are those used for the comprehensive All Commodities index.

² Data for 1985 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

All commodities except farm products: 02 through 15

All foods: 011, 017, and 02 less 0261, 0262, and 029

Processed foods: 02 less 0261, 0262, and 029

Industrial commodities less fuels and related products and power: 03, 04, and 06 through 15

Selected textile mill products: 0327, 03370105, 03370107, 03370109, 03370111, 034, 03810168, 03810169, 03810272, 03810274, 03810298, 03810364, 038201, 03820303, 03830323, 03830324, 03830325 and 1231

Hosiery: 03810168, 03810169, 03810171, 03810272, 03810273, 03810363, 03810364, and 03810365

Underwear and nightwear: 03810174, 03810175, 03810176, 03810177, 03810178, 03810274, 03810275, 03810276, 03810277, 03810368, and 03810369

Chemicals and allied products, including synthetic rubber and synthetic fibers: 031, 06 less 064, and 071102

Pharmaceutical preparations: 0634, 0635, and 0636

Lumber and plywood³: 061 and 063

Steel mill products, including fabricated wire products: 1017 and 1068

Finished steel mill products, excluding fabricated wire products: 1017 less 101701 and 101702

Finished steel mill products, including fabricated wire products: 1017 and 1068 less 101701 and 101702

Special metals and metal products: 10, 111, and 141

Fabricated metal products: 10-3 through 10-8

Copper and copper products: 10220123, 10220161, 10220182, 102301, 10240301, 10240302, 10240304, 10240305, 102502, 10260315, 10260316, 10260317, 10260319, 10260325, 10260301, 10260302, and 10260303

Machinery and motive products: 11 and 14

Machinery and equipment, except electrical: 111, 112, 113, 114, 116, 118, and 119

Agricultural machinery, including tractors: 1111 and 1112 less 11115211 and 111251

Metaworking machinery: 113A, 1132, 113304, 1137, and 1138

Total tractors: 1111 and 1126 less 11115211, 112602, and 112603

Agricultural machinery and equipment, less parts (old commodity code 111): 111 less 11115211 and 111251

Farm and garden tractors, less parts (old commodity code 1111): 1111 less 11115211

Agricultural machinery excluding tractors, less parts (old commodity code 1112): 1112 less 111251

¹ Monthly data and annual averages have been revised to reflect the availability of late report and corrections by respondents. Revised indexes may not agree with previously published revised data because of a comprehensive historical revision which became effective in March 1985.

² Postal service prices contained in the Consumer Price Index are from first class and fourth class mail.

³ Transient rate mail discontinued March 1985.

Relative Importance

Tables 12 and 13 contain relative importance data as of December 1985 by stage of processing, as well as by commodity groups, subgroups, product classes, and individual items.

Relative importance data are derived from 1972 values of shipments, adjusted for price change between 1972 and December 1985. The relative importance of a category represents the value of shipments for that category plus the value of unpriced commodities assumed to have price movements similar to those of the priced items. Relative importance data are generally expressed as a percentage

of the total weight of some composite grouping. Data in table 12 are expressed as a percentage of one of the three major stage-of-processing indexes, i.e., Finished Goods, Intermediate Goods, or Crude Goods. All data in table 13 are expressed as a percentage of the all commodities index.

For a description of the procedures for calculating relative importance data, see *Producer Prices and Price Indexes, Supplement 1979, Data for 1978*. Guidelines for combining components to construct special indexes are presented in *Supplement to Producer Prices and Price Indexes, Data for 1981*.

¹ The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of the SOP category. See note on relative importance on page 241. The "Revised" column shows relative importance figures for December 1985 based on 1972 shipment values from the Census of Manufactures and other sources, after the sample revision effective January 1986; the "Former" relative import-

ance figures are for the same month before the revision of the index sample. Except for recodes, a dash in the "Former" column indicates the series was introduced in January 1986, and a dash in the Revised" column indicates that the series was discontinued as of January 1986. Individual items and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents a percentage less than 0.005.

¹ Comprehensive relative importance figures are computed once each year in December. See note on page 241. The "Revised" column shows relative importance figures for December 1985 based on 1972 shipment values from the Census of Manufactures and other sources, after the sample revision effective January 1986; the "Former" relative importance figures are for the same month before the revision of the index sample. Except for recodes, a dash in the "Former" column indicates the series was introduced in January 1986, and a dash in the "Revised" column indicates that the

series was discontinued as of January 1986.

² The relative importance data for the three major sop groupings—Finished Goods, Intermediate Materials, and Crude Materials—do not add up to 100.000 because they exclude the portion of goods allocated to government purchases and exports.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,200 commodities and 75,000 quotations per month.

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes and; (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 3). The commodity structure (table 4) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or a business firm. Consumer foods include unprocessed foods, such as eggs and fresh vegetables, as well as processed foods, such as bakery products and meats. Other finished consumer goods include durable goods, such as automobiles, household furniture, and appliances, and nondurable goods, such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton

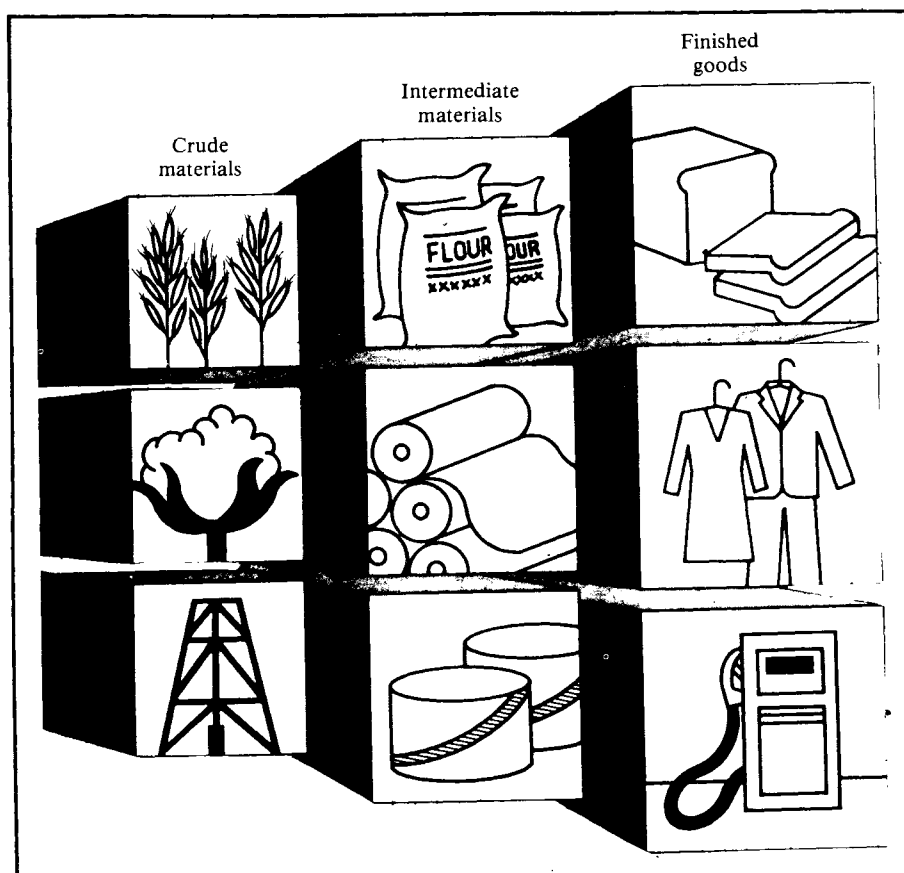

yarn, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that are purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extensions of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 3 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and for some industries, indexes for other sources of revenue.

Industries may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from the sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 3 correspond to 8-digit commodity indexes in table 4. In these cases, movements in the latter indexes are calculated on the basis of the movements of their counterparts in table 3. Although most such indexes continue to be published in table 4 on their original base period of 1967 = 100 or some later base, corresponding indexes in table 3 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection

proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported monthly by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are always provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct this weakness at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most producer price indexes currently reflect values of shipments reported in the 1972 Census of Manufactures; these weights will be updated for 1982 Census of Manufactures data in 1987.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 7, "Producer Prices," in *BLS Handbook of Methods* (1982), Bulletin 2134-1. Reprints are available from the Bureau of Labor Statistics on request (202-523-1221).

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

<i>Index Point Change</i>	
Finished Goods Price Index	288.5
Less previous index	285.0
Equals index point change	3.5
<i>Index Percent Change</i>	
Index point change	3.5
Divided by the previous index	285.0
Equals	0.012
Result multiplied by 100	0.012 x 100
Equals index percent change	1.2

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6- month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1967 or some later month). An increase of 188.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 288.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1967 to \$288.50 today." Likewise, a current index of 300.0 would indicate that prices received by producers of finished goods today are triple what they were in 1967. □
