*Producer Price Indexes*—(ISSN 0882-5270) is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights.

A subscription may be ordered for 1 or 2 years from: New Orders, Superintendent of Documents, P.O. Box 371954, Pittsburgh, PA 15250-7954. Subscription price per year: \$34 domestic (includes supplement), \$42.50 foreign. The price of the supplement alone is \$22 domestic and \$27.50 foreign. Prices are subject to change by the U.S. Government Printing Office.

Send correspondence on subscription matters, including address changes and missing issues, to the Superintendent of Documents, U.S. Government Printing Office, Washington DC 20402, (202) 512-2303. POSTMASTER: Send address changes to *Producer Price Indexes*, U.S. Government Printing Office, Washington, DC 20402.

# Preface

This annual *Supplement to Producer Price Indexes* presents monthly indexes and annual averages for 1994. Indexes shown in the *Supplement* are not seasonally adjusted. The *Supplement* also provides information on the relative importance of components at the end of the year. It also

summarizes the major price developments during 1994.

Information on changes in the sample for producer price indexes during 1994 can be found in the January 1994 and July 1994 issues of *Producer Price Indexes*.

# Price Highlights, 1994

William D. Thomas and Scott Sager

Prices received by domestic producers of finished goods rose 1.7 percent between December 1993 and December 1994, following increases of 0.2 percent in 1993 and 1.6 percent in 1992. The index for energy goods turned up 3.4 percent in 1994 after declining in each of the previous 3 years, while prices for foods advanced 1.0 percent following somewhat larger increases in both 1993 (2.4 percent) and 1992 (1.6 percent). Price increases for finished goods other than foods and energy accelerated to 1.6 percent in 1994 from 0.4 percent in 1993; these prices had risen 2.0 percent in 1992.

Developments at earlier stages of processing were mixed. The Intermediate Goods Price Index advanced 4.4 percent in 1994 after increasing 1.0 percent in each of the preceding 2 years. In contrast, the Crude Goods Price Index declined 0.5 percent last year after rising by 0.1 percent in 1993 and 3.3 percent in 1992. At both the intermediate and crude stages of processing, prices for food-related materials turned down in 1994 after advancing a year earlier, while price increases for nonfood nonenergy materials slowed significantly. Prices for energy goods rose at the intermediate stage after falling a year earlier, but declined much less at the crude stage, following a steep decline in 1993. (See table 1.)

The U.S. economy gained strength throughout 1994, continuing much the same pace of growth experienced toward the end of 1993. A key factor driving this expansion was the increase in outlays for fixed investments by business, particularly spending on capital goods such as computers and peripheral equipment, and also for cars and trucks. (For the past 3 years, the rate of increase in spending for computer equipment has been more than 4 times that for expenditures on other types of capital equipment.) Investment in nonresidential structures also picked up, despite the raising of short-term interest rates several times during the year.

In 1994, the growth of the economy was also evident in the Federal Reserve Board's capacity utilization index for mining, manufacturing, and utilities. This

index stood at 84.9 in December 1994, its highest level in any month since March 1989. In addition, personal consumption spending rose 3.4 percent in 1994, fueled by an 8.1-percent advance in purchases of consumer durables. Growth in consumer expenditures for durables reflected increased purchases of furniture and household durables, such as video, audio, and computer equipment, as well as outlays for cars and light trucks. By the end of 1994, consumer spending had surged to a 5-year high, reflecting the ready availability of credit—including the proliferation of credit card programs that offered cardholders rewards, such as direct rebates on purchases or frequent-flyer miles based on the amounts charged.

Some vigor was evident in the interest-sensitive residential housing market, which was buoyed by growth in incomes and employment over the year. Housing starts attained their highest level since 1988, and both single-family home starts and sales of existing single-family homes registered their largest annual gains in over 15 years. Despite a slowdown in residential investment evident during the latter half of 1994, figures for the year as a whole surpassed those posted in 1993. A major factor in the strength of the housing sector in 1994 was the availability of adjustable-rate mortgages, which permitted borrowers to structure their monthly payments in innovative ways.

In 1994, much of the increased spending for computer equipment mentioned earlier reflected the strategy by many firms to increase productivity and efficiency while downsizing their work forces to reduce labor costs. Despite this general restructuring throughout the economy, construction employment registered its largest yearly advance in a decade, while manufacturing employment recorded its largest gain since 1987. However, almost 85 percent of the advance in payroll employment was in lower-paying jobs in the services sector.

Among other indicators of economic health, manufacturing productivity increased 4.9 percent in 1994, compared with 3.2 percent a year earlier. The Employment Cost Index of total compensation for workers in private industry rose 3.0 percent, after increasing 3.6 percent in 1993. Real disposable income advanced 4.3 percent over the year. Business spending on inventories increased in

the second, third, and fourth quarters of 1994, particularly in the wholesale and retail trade sectors, reflecting in part an optimistic outlook for continued growth in demand.

The commercial construction market, although not very robust in most regions of the country, was considerably more vibrant than in recent years, during which there was a wide surplus from overbuilding. Overall, public construction spending on infrastructure and other projects outpaced that of 1993.

A surge in export sales resulted from a combination of factors, including the strengthening recovery in foreign industrial countries; continued robust growth

in developing countries; the decline in the dollar's exchange value; the implementation of the North American Free Trade Agreement; and the ongoing improvement in America's underlying competitiveness. However, the rise in exports was outstripped by the increase in imports that accompanied domestic investment and consumption demand. The value of the dollar declined about 8 percent last year (on a trade weighted basis) against the currencies of the nine major foreign industrial countries. However, the dollar fluctuated more substantially against some individual currencies, particularly those of Japan and Germany.

<sup>1</sup> Monthly data and annual averages have been recalculated to incorporate late reports and corrections by respondents.  
<sup>2</sup> Industry and product class indexes may include products not shown separately.  
<sup>3</sup> Not available.  
n.e.c. = Not elsewhere classified.  
mpm = Made from purchased materials.

n.s.k. = Not specified by kind.  
Note: Indexes in this table are calculated by a revised methodology. See Technical Notes at the back of this publication. The annual average calculation method for the PPIR differs from that of the PPI (table 4). The PPIR method averages the unrounded monthly indexes, and also includes unpublished monthly data. Therefore, the annual averages may not agree with those computed by averaging the monthly indexes as shown above.

<sup>1</sup> Monthly data and annual averages have been recalculated to incorporate late reports and corrections by respondents. Indexes in this table are derived from the primary product indexes in table 3 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the economy, excluding

capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of change in construction costs. See note on page 190 of *Producer Price Indexes Data* for July 1986.

<sup>1</sup> Monthly data and annual averages have been recalculated to incorporate late reports and corrections by respondents. Indexes in this table are derived from the product indexes in table 3. These indexes are composed of the goods used by the industries in each of the industry stage-of-process output indexes

as shown by the 1977 input/output relationships. These material inputs include only domestic material input and do not include any imported materials which may be used.

<sup>1</sup> The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of the SOP category. The "Revised" column shows relative importance figures for December 1994 based on 1987 shipment values from the Census of Manufactures and other sources, after the sample revision effective January 1995; the "Former" relative importance figures are for the same month before the revision of the index sample. Except for recodes, a dash in the

"Former" column indicates that the series was introduced in January 1995 and a dash in the "Revised" column indicates that the series was discontinued as of January 1995. Groupings and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents either a percentage less than 0.0005 or a grouping newly introduced or deleted in January 1995 (if the 0.000 appears in the "Former" or "Revised" column, respectively).

<sup>1</sup>The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of total weight of the SOP category. The "Revised" column shows relative importance figures for December 1994 based on 1987 shipment values from the *Census of Manufactures* and other sources, after the sample revision effective January 1995; the "Former"

relative importance figures are for the same month before the revision of the index sample. Groupings and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents either a percentage less than 0.0005 or a grouping newly introduced or deleted in January 1995 (if the 0.000 appears in the "Former" or "Revised" column, respectively). Newly introduced or deleted groupings may be identified by referring to table 10.

<sup>1</sup> All relative importance figures in this table are expressed as a percentage of the All Commodities index. The "Revised" column shows relative importance figures for December 1994 based on weights taken from 1987 shipment values from the *Census of Manufactures* and other sources, and reflects all sample revisions effective January 1995. The "Former" column provides relative importance figures for the same month based on weights taken from 1987 shipment values, before the January 1995 sample revision. Except for recodes, a dash in the "Revised" column indicates a series that was discontinued as of January 1995, while a dash in the "Former" column indicates a series

introduced that same month. Subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents a percentage less than 0.0005.

<sup>2</sup> The relative importance data for the three major SOP groupings—Finished Goods, Intermediate Materials, and Crude Materials—do not add up to 100.000 because they exclude the portion of goods allocated to government purchases and exports.

# Technical Notes

## Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,200 commodities and 80,000 quotations per month.

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes and; (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 3). The commodity structure (table 4) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, and nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that are purchased by

business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the

first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extension of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 3 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 3 correspond to 8-digit commodity indexes in table 4. In these cases, movement of the latter indexes are calculated on the basis of movements of their counterparts in table 3. Although most such indexes continue to be published in table 4 on a base period of 1982=100 or some later base, corresponding indexes in table 3 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment

to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing indexes) calculated from traditional commodity groupings, currently reflect 1987 values of shipments as reported in the *Census of Manufactures* and other sources. From January 1987 through December 1991, PPI weights were derived from 1982 shipment values. Industry indexes, which are based on the SIC system, continue to be calculated with 1977 net output weights.

Effective with publication of January 1988 data, many important PPI series (including all stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100, to coincide with the reference year of shipment weights. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not cause any changes to previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 16, "Producer Prices," in *BLS Handbook of Methods* (1992), Bulletin 2414. Reprints are available from the Bureau of Labor Statistics on request (202-606-STAT).

## Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

<i>Index Point Change</i>	
Finished Goods Price Index .....	107.5
Less previous index .....	104.0
Equals index point change .....	3.5
<i>Index Percent Change</i>	
Index point change .....	
Divided by the previous index .....	104.0
Equals .....	0.034
Results multiplied by 100 .....	0.034 x 100
Equals percent change .....	3.4

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1982 or some later month). An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$105.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods today are 10 percent lower than they were in 1982.

### Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about

the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, 1991 edition, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived from the X=11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January through December 1991 were replaced at the beginning of 1992. Indexes for most broad commodity groupings and 8-digit individual commodities in table 4, as well as industry and Census product indexes in table 3, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 4 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregate method, which combines seasonal movements of the basic stage-of-processing categories, and from a wide variety of food and certain other subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behavior abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

For more information, see (1) appendix A, "Seasonal Adjustment Methodology at BLS," in *BLS Handbook of Methods* (1992), Bulletin 2414 and (2) "Summary of Changes to the PPI's Seasonal Adjustment Methodology" in the January 1995 issue of *Producer Price Indexes*.
