*Producer Price Indexes* is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights. (ISSN 0882-5270)

To order this periodical for 1 year, cite *Producer Price Indexes* (WPPI) and send your check for \$35.00 (\$43.75 foreign) or provide your VISA or Master card number and expiration date to Superintendent of Documents, P.O. Box 371954, Pittsburgh, PA 15220-7954.

Subscribers will receive the next available subscription issue after their order is received. An acknowledgement card is sent to all customers directly after their subscription order is processed simply to let them know that they will receive the next available issue released for their subscription order.

Please wait at least 6 weeks before inquiring about your order. Then write to Subscription Service Section, U.S. Government Printing Office, Stop: SSOM, Washington DC 20402, telephone (202) 512-1806 or FAX (202) 512-2168.

To change your address: Please send your mailing label, along with your new address to the Superintendent of Documents, Attn: Chief, Mail List Branch, Mail Stop: SSOM, Washington, DC 20402.

Data for 1995

# Preface

This annual *Supplement to Producer Price Indexes* presents monthly indexes and annual averages for 1995. Indexes shown in the *Supplement* are not seasonally adjusted. The *Supplement* also provides information on the relative importance of components at the end of the year. It also summarizes the major price developments during 1995. In addition, this *Supplement* presents the

final historical data for selected telephone industry indexes that were discontinued in July 1995.

Information on changes in the sample for producer price indexes during 1995 can be found in the January 1995 and July 1995 issues of *Producer Price Indexes*.

# Price Highlights, 1995

William D. Thomas

Prices received by domestic producers of finished goods rose 2.3 percent in 1995, following a 1.7-percent increase in 1994 and a 0.2-percent rise in 1993. After increasing 1.1 percent in 1994, the index for finished consumer foods move up 1.9 percent in 1995. Price increases for finished energy goods slowed to 1.1 percent in 1995 from 3.5 percent in 1994. The "core" index for finished goods—those other than foods and energy, which include consumer goods such as passenger cars and apparel, as well as capital equipment such as trucks and machine tools—advanced 2.6 percent in 1995 after rising 1.6 percent in 1994. (See table A.)

At the earlier stages of processing, the results were mixed in 1995. The price index for intermediate goods increased 3.3 percent in 1995, following a 4.4-percent advance in 1994 and a 1.0-percent rise in the year before that. This index measures the movement in prices of goods such as flour, steel, lumber, industrial chemicals, diesel fuel, and paper boxes. The index for crude goods turned up 5.5 percent, after edging down slightly in 1994. Items in this index include wheat, scrap metals, logs, crude petroleum, and cotton. Prices for food-related materials at both the intermediate and crude stages of processing rose sharply in 1995, after falling in the previous year. Prices for crude energy goods turned up in 1995, after showing little change in 1994; price increases for intermediate energy goods, however, slowed to 1.1 percent in 1995 from 2.9 percent in 1994. When the more volatile food and energy components are excluded, price increases slowed from 1994 to 1995 at the intermediate level, while prices for the corresponding category for crude goods turned down following 2 years of double-digit increases.

Higher interest rates, along with the effects of the economic crisis in Mexico, dampened economic growth in the first quarter of 1995. A slackening economy was evident as housing starts dropped in the first 2 months of the year. Although

housing activity stabilized and then moved slightly higher over the balance of 1995, the fall in starts translated into declines in residential investment during the early months of the year. Motor vehicle sales also weakened from 1994 levels, resulting in a buildup of inventory that reached burdensome proportions by the end of the first quarter. In response, automakers cut production sharply in the second quarter, thereby restraining growth in the gross domestic product. Auto production picked up in the ensuing months, but still did not reach the 1994 level at yearend.

At the beginning of 1995, personal consumption expenditures grew, but at a pace much less than during the last quarter of 1994. The drop in spending growth was concentrated in durable goods, as a result of slackened demand for automobiles.

William D. Thomas is an economist in the Division of Industrial Prices and Price Indexes, Bureau of Labor Statistics.

Spending on durables recovered markedly in the other 9 months of the year. However, spending on nondurable goods waned. By yearend, the pace of growth in consumption expenditures was vigorous once again. Real disposable income increased at an annual rate of 5.8 percent in 1995, about the same as in 1994. Hourly compensation in the private sector, as measured by the Employment Cost Index, increased 2.8 percent in the year ending December 1995, compared to a 3.1-percent increase during the previous year. In 1995, payroll employment advanced 1.9 percent; most of the increase was attributable to the services sector, which rose 4.1 percent.

As 1995 unfolded, households continued to take on debt at a rapid rate, raising concerns that they might soon have to reduce their spending in order to meet obligations. Household debt (consumer and mortgage debt) grew faster than disposable personal income, continuing the pattern of the past several years. The burden for this debt, as measured by debt service as a share of disposable personal income, also rose during the year, although it remained below the figure reached during the late 1980s. The 1995 rise in the debt service rates reflected both the sharp rise in interest rates over the year and a sharp rise in the overall debt level.

Business fixed investment grew steadily, but moderately, in 1995. The growth rate of business equipment investment, although not as rapid as in 1994, was sustained by robust investment in computers, which grew much faster in 1995 than in

1994. Investment in structures continued its recovery from the recession of 1990-91 and, like equipment investment, grew about 10 percent in 1995. The extremely slow recovery of investment in structures following the recession appears to have been due in part to an oversupply of office buildings and retail space that characterized the runup and subsequent collapse of the commercial real estate market during the late 1980s and early 1990s. As in the previous 2 years, the vacancy rate for office space continued to decline.

The buildup of excess inventories during the first quarter of 1995 led some producers to cut back output in the second quarter, so as to reduce inventories relative to sales. Producers continued to pare inventories, especially in the automotive sector, during the third and fourth quarters. By late year, much of the earlier overhang had been worked off. At yearend, however, automobile industry data showed the inventory-to-sale ratio moving back up, although it remained below the levels reached earlier in the year.

Corporate profits increased in 1995 at about the same pace as in 1994. The pattern over the year followed that of overall economic growth, with profits softening during the first half and rebounding strongly during the third quarter. Other components of national income likewise increased at more moderate rates during 1995, with the exception of rental income, which declined through the third quarter.

<sup>1</sup> Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents.

<sup>2</sup> Industry and product class indexes may include products not shown separately.

<sup>3</sup> Not available.

n.e.c. = Not elsewhere classified.

mipm = Made from purchased materials.

n.s.k. = Not specified by kind.

Note: Indexes in this table are calculated by a revised methodology. See Technical Notes at the back of this publication. The annual average calculation method for the PPIR differs from that of the PPI (table 4). The PPIR method averages the unrounded monthly indexes, and also includes unpublished monthly data. Therefore, the annual averages may not agree with those computed by averaging the monthly indexes as shown above.

<sup>1</sup> For a description of the indexes that comprise these special commodity groupings, see monthly issues of *Producer Price Indexes*. Monthly data and annual averages have been recalculated to incorporate late reports and corrections by respondents.

This table contains the final historical data for selected telephone industry indexes. These indexes were originally published as table 9 in the monthly issues of this report and were discontinued in July 1995. Successor indexes were introduced in July 1995 and are described in the article

"New indexes for the Telecommunications Industry" in the issue with data for July 1995. These new Telecommunications industry output indexes are published in table 3 under SIC 4813—Telecommunications, except radio telephone.

<sup>1</sup> Monthly data and annual averages have been recalculated to incorporate late reports and corrections by respondents. Indexes in this table are derived from the primary product indexes in table 3 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of

the economy, excluding capital equipment. Because they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of *Producer Price Indexes Data* for July 1986.

<sup>1</sup> Monthly data and annual averages have been recalculated to incorporate late reports and corrections by respondents. Indexes in this table are derived from the product indexes in table 3. These indexes are composed of the goods used by the industries in each of the industry stage-of-process output indexes

as shown by the 1977 input/output relationships. These material inputs include only domestic material input and do not include any imported materials which may be used.

<sup>1</sup> The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of the SOP category. The "revised" column shows relative importance figures for December 1995 based for the first time on 1992 shipment values from the Census of Manufactures and other sources, and reflects all sample revisions effective January 1996. The "former" column provides relative

importance figures for the same month, since 1992, on 1987 shipment values, before the 1996 sample revisions effective January 1996. A dash in the "former" column indicates that the series was introduced in January 1996 and a dash in the "revised" column indicates that the series was discontinued as of January 1996. Individual items and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents a percentage less than 0.0.0005.

<sup>1</sup> The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of the SOP category. The "revised" column shows relative importance figures for December 1995 based for the first time on 1992 shipment values from the Census of Manufactures and other sources, and reflects all sample revisions effective January 1996. The "former" column provides relative

importance figures for the same month, since 1992, on 1987 shipment values, before the 1996 sample revisions effective January 1996. A dash in the "former" column indicates that the series was introduced in January 1996 and a dash in the "revised" column indicates that the series was discontinued as of January 1996. Individual items and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents a percentage less than 0.0.0005.

<sup>1</sup> All relative importance figures in this table are expressed as a percentage of the All Commodities index. The "revised" column shows relative importance figures for December 1995 based, for the first time, on 1992 shipment values from the Census of manufactures and other sources, and reflects all sample revisions effective January 1996. The "former" column provides relative importance figures for the same month based, since 1992, on 1987 shipment values, before the 1996 sample revisions. A dash in the "former" column indicates that the series was introduced in January 1996 and a dash in the "revised" column indicates that the series was discontinued as of January 1996.

Individual items and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents a percentage less than 0.0005.

<sup>2</sup> The relative importance data for the three major stage-of-processing groupings—finished goods, intermediate materials, and crude materials—do not add up to 100.000 because they exclude the portion of goods allocated to government purchases and exports.

## Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,200 commodities and 80,000 quotations per month.

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes and; (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 3). The commodity structure (table 4) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, and nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that are purchased by

business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the

first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extension of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 3 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 3 correspond to 8-digit commodity indexes in table 4. In these cases, movement of the latter indexes are calculated on the basis of movements of their counterparts in table 3. Although most such indexes continue to be published in table 4 on a base period of 1982=100 or some later base, corresponding indexes in table 3 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment

to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing indexes) calculated from traditional commodity groupings, currently reflect 1987 values of shipments as reported in the *Census of Manufactures* and other sources. From January 1987 through December 1991, PPI weights were derived from 1982 shipment values. Industry indexes, which are based on the SIC system, continue to be calculated with 1977 net output weights.

Effective with publication of January 1988 data, many important PPI series (including all stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100, to coincide with the reference year of shipment weights. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not cause any changes to previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 16, "Producer Prices," in *BLS Handbook of Methods* (1992), Bulletin 2414. Reprints are available from the Bureau of Labor Statistics on request (202-606-STAT).

## Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

<i>Index Point Change</i>	
Finished Goods Price Index .....	107.5
Less previous index .....	104.0
Equals index point change .....	3.5
<i>Index Percent Change</i>	
Index point change .....	
Divided by the previous index .....	104.0
Equals .....	0.034
Results multiplied by 100 .....	0.034 x 100
Equals percent change .....	3.4

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1982 or some later month). An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$105.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods today are 10 percent lower than they were in 1982.

## Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about

the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, 1991 edition, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived from the X=11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January through December 1991 were replaced at the beginning of 1992. Indexes for most broad commodity groupings and 8-digit individual commodities in table 4, as well as industry and Census product indexes in table 3, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 4 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregate method, which combines seasonal movements of the basic stage-of-processing categories, and from a wide variety of food and certain other subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behavior abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.
