PPI Detailed Report is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights. (ISSN 0882-5270)

To order this periodical for 1 year, cite *PPI Detailed Report* (WPPI) and send your check for \$36.00 (\$45.00 foreign) or provide your VISA or Master card number and expiration date to Superintendent of Documents, P.O. Box 371954, Pittsburgh, PA 15220-7954. Cost of the supplement only is \$29.00 domestic (\$36.25 foreign).

Subscribers will receive the next available subscription issue after their order is received. An acknowledgement card is sent to all customers directly after their subscription order is processed simply to let them know that they will receive the next available issue released for their subscription order.

Please wait at least 6 weeks before inquiring about your order. Then write to Subscription Service Section, U.S. Government Printing Office, Stop: SSOM, Washington DC 20402, telephone (202) 512-1800 or FAX (202) 512-2168.

Producer Price Indexes

Data for 1996

Preface

This annual *Supplement to Producer Price Indexes* presents monthly indexes and annual averages for 1996. Indexes shown in the *Supplement* are not seasonally adjusted. The *Supplement* also provides information on the relative importance of components at the end of the year. It also summarizes the major price developments during 1996.

Information on changes in the sample for producer price indexes during 1996 can be found in the January 1996 and July 1996 issues of *Producer Price Indexes*. See also, "Quality adjustment for changes to gasoline resulting from the California Air Resources Board requirements, effective March 1996" in the April 1996 issue.

Price Highlights, 1996

Prices received by domestic producers of finished goods increased 2.8 percent in 1996, following a 2.3-percent rise in 1995 and a 1.7-percent advance in 1994. The index for finished energy goods moved up 11.7 percent from December 1995 to December 1996, after an increase of 1.1 percent a year earlier. Prices for foods, such as fresh fruits and melons, pork, and bakery products rose 3.4 percent in 1996, following a 1.9-percent increase in 1995. However, price increases for finished goods other than foods and energy, which includes consumer goods such as passenger cars and apparel, slowed to 0.6 percent in 1996 from 2.6 percent in 1995. (See table A.)

Price changes were mixed in 1996 at the earlier stages of processing. The index for intermediate goods moved up 0.7 percent in 1996, after showing a 3.3-percent rise in 1995. This index measures the price movements of goods such as flour, steel, lumber, industrial chemicals, diesel fuel, and paper boxes. Price increases for crude goods accelerated to 14.7 percent in 1996 from 5.5 percent in 1995. Crude goods include wheat, scrap metals, logs, crude petroleum, and cotton. Price increases for food-related materials at the intermediate stage of processing slowed from 1995 to 1996; at the crude level, the index for foodstuffs and feedstuffs turned down in 1996 after rising sharply in 1995.

Economic growth during 1996 was solid overall, but fluctuated when transitory factors took their toll. For example, unusually severe weather in January and a March strike at a major automobile manufacturer resulted in some sluggishness in the first quarter. However, the economy rebounded in the second quarter and growth moderated in the third quarter. After rising for all of 1995, the unemployment rate edged down 0.3 percent in 1996. As measured by the *Bureau of Labor Statistics' Current Employment Statistics Program*, nonfarm employment grew at a brisk pace during the first 8 months of the year. Employment growth moderated over the last 4 months, reflecting the deceleration in output in the second half of the year. The robust nature of the economy allowed for sustained low unemployment and inflation. Solid growth was evidenced in 1996 despite a very limiting fiscal policy.

After dropping the interest rate in January 1996, the Federal Reserve kept the federal funds rate flat for much of the rest of the year. Inflation appeared to be subdued and the economy expanded at a sustainable pace. Long-term interest rates moved in harmony with the pace of economic activity over the course of the year,

increasing through the summer, then decreasing in the fall, and up again only toward the end of the year.

On the strength of rapid growth in orders for durable goods, consumption expenditures moved up at a 3.4-percent annual rate in the first half of 1996, led by an increase in expenditures for new automobiles in the first 3 months; spending for other durable goods also picked up substantially in the first half. Lower interest rates and the rise in household wealth, due to the very substantial improvement in stock market prices, helped to stimulate spending on durables. The high level of mortgage-refinancing activity in the winter of 1995, may also have contributed to the upswing by reducing mortgage payments. Consumer spending growth contracted in the third quarter when intermediate and long-term interest rates moved higher. Real disposable personal income expanded at a significant rate in 1996. Residential investment grew quickly at a fast clip through the first half of 1996, despite harsh

winter weather that hampered construction early in the year, and rising long-term interest rates through the late winter and spring. Another bright spot was shown by measures of household affordability, which were at their highest levels since the late 1970s. Adjustable-rate mortgages greatly increased the pool of potential purchasers. Residential construction picked up by the last 3 months of 1996. Long-term interest rates declined in the fall; the rate on conventional mortgages fell, taking back about half of its 1995 increase.

Expenditures for producers' durable equipment were robust in 1996. Investment

in computers increased sharply, as companies upgraded their computers while experiencing increased demand for their products, substantial profits, and technological advances. However, business investment in structures rose moderately in 1996; this sector continued attempts to grow out from under the burdensome situation of excess supply caused by overbuilding in the 1980s. As in 1995, investment in non-farm business inventories declined in early 1996, as business firms continued to work off excess stocks. Although inventory investment picked up later in the year, the 1996 inventory-to-sales ratios were lean by historical standards.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents.

² Industry and product class indexes may include products not shown separately.

³ Not available.

n.e.c. = Not elsewhere classified.

Mfpm = Made from purchased materials.

n.s.k. = Not specified by kind.

Note: Indexes in this table are calculated by a revised methodology. See Technical Notes at the back of this publication. The annual average calculation method for the PPIR differs from that of the PPI (table 4). The PPIR method averages the unrounded monthly indexes, and also includes unpublished monthly data.

Therefore, the annual averages may not agree with those computed by the monthly indexes as shown above.

¹ Monthly data and annual averages have been recalculated to incorporate late reports and corrections by respondents. Indexes in this table are derived from the primary product indexes in table 3 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of

the economy, excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of *Producer Price Indexes*, data for July 1986.

¹ Monthly data and annual averages have been recalculated to incorporate late reports and corrections by respondents. Indexes in this table are derived from the product indexes in table 3. These indexes are composed of the goods used by the industries in each of the industry stage-of-process output indexes as shown by the

1977 input/output relationships. These material inputs include only domestic material input and do not include any imported materials which may be used.

¹ The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of the SOP category. The "Revised" column shows relative importance figures for December 1996 based on 1992 shipment values from the *Census of Manufactures* and other sources, and reflects all sample revisions effective January 1997.

The "Former" column provides relative importance figures for the same month before the revision of the index sample. Groupings and subtotals may not add exactly to totals because of rounding differences. A dash in the "Former" column indicates that the series was introduced in January 1997 and a dash in the "Revised" column indicates that the series was discontinued as of January 1997. The value 0.000 represents a percentage less than 0.0005.

¹ The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of the SOP category. The "Revised" column shows relative importance figures for December 1996 based on 1992 shipment values from the *Census of Manufactures* and other sources, and reflects all sample revisions effective January 1997. The "Former" column provides relative

importance figures for the same month before the revision of the index sample. Groupings and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents either a percentage less than 0.0005, or a grouping newly introduced or deleted in January 1997 (If the 0.000 appears in the "former" or "revised" column, respectively). Newly introduced or deleted groupings may be identified by referring to table 9.

	Nonmanufacturing industries	5.993	5.993				

¹ All relative importance figures in this table are expressed as a percentage of the All Commodities index. The "revised" column shows relative importance figures for December 1996 based on 1992 shipment values from the *Census of Manufactures* and other sources, and reflects all sample revisions effective January 1997. The "Former" column provides relative importance figures for the same month before the revision of the index sample. A dash in the "Former" column indicates that the series was introduced in January 1997 and a dash in the "Revised" column indicates that the series was discontinued as of January

1997. Individual items and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents a percentage less than 0.0005.

² The relative importance data for the three major stage-of-processing groupings—finished goods, intermediate materials, and crude materials—do not add up to 100.000 because they exclude the portion of goods allocated to government purchases and exports.

Technical Notes

Brief Explanation of Producer Price Indexes

The term Producer Price Index (PPI) refers to a family of indexes that measure the average change over time in the selling prices received by domestic producers of goods and services. The PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI); CPIs measure price change from the purchaser's perspective. Sellers' and purchasers' prices may differ due to government subsidies, sales and excise taxes, and distribution costs.

Over 10,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors of the U.S. economy. New PPIs are gradually being introduced for the products of industries in the transportation, utilities, trade, finance, and services sectors of the economy.

Over 100,000 price quotations per month are organized into three sets of producer price indexes: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure (tables 1, 2, and 3) organizes products by class of buyer and degree of fabrication. The commodity structure (tables 2 and 6) organizes products by similarity of end use or material composition. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (tables 4 and 5).

Stage-of-Processing Indexes

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances; and nondurable goods such as

apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and

components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Commodity Indexes

The commodity classification structure of the Producer Price Index organizes products by similarity of end use or material composition, regardless of their industry of origin. Fifteen major commodity groupings (2-digit level) make up the all commodities index. Each major commodity grouping includes (in descending order of aggregation) subgroups (3-digit), product classes (4-digit), subproduct classes (6-digit), and individual items (8-digit).

Nearly all 8-digit commodities under the traditional commodity coding system are now derived from corresponding industry-classified product indexes. In such instances, movements in the traditional commodity price indexes are identical to movements of their counterparts. Therefore, monthly percent changes for corresponding indexes will be virtually identical even though their respective index levels may differ.

Industry Net-Output Price Indexes

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC). Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 4 lists indexes for the net output of major mining and manufacturing industry groups at the 2-digit level. Table 5 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digits levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product indexes. Every industry has

primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, most industries have secondary product indexes that show changes in prices received by establishments classified in the industry for products chiefly made in some other industry. Finally, some industries may have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 5 correspond to 8-digit commodity indexes in table 6. In these cases, movement of the latter indexes are calculated on the basis of movement of their counterparts in table 5. Although most such indexes continue to be published in table 6 on a base period of 1982=100 or some later base, corresponding indexes in table 5 are published on a base of the month of their introduction.

Data Collection

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. The Bureau of Labor (BLS) statistics strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Weights

Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing indexes) calculated from traditional commodity groupings, currently reflect 1992 values of shipments as reported in the Census of Manufactures and other sources. From January 1992 through December 1995, PPI weights were derived from 1987 shipment values. Industry indexes shown in table 4 are also now calculated with 1992 net output weights. This periodic update of the

value weights used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

Price Index Reference Base

Effective with publication of January 1988 data, many important PPI series (including stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not alter any changes to previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, "Producer Prices," in BLS Handbook of Methods (April 1997), Bulletin 2490. Reprints are available from the Bureau of Labor Statistics on request.

Calculating Index Changes

Each index measures price changes from a reference period which equals 100.0 (1982 or some later month). An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$105.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods today are 10 percent lower than they were in 1982.

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes

are affected by the level of the index in relation to its baseperiod, while percent changes are not. The box shows the computation of index point and percent changes.

Index point changes

Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5

Index Percent Change

Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034 x 100
Equals percent change	3.4

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchasing agreements or real estate leases. (See Escalation and Producer Price Indexes: A Guide for Contracting Parties, BLS Report 807, September 1991, available on request from BLS.)

In most cases, seasonal factors used in computing seasonally adjusted indexes have, in the past, been derived using the X-11-ARIMA Seasonal Adjustment Method. However, the PPI program will upgrade to X-12 beginning in 1998. Each year, the seasonal status of most commodity indexes is reevaluated in order to reflect more

recent price behavior.¹ For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data for the previous 5 years. These updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or aggregative method. Generally, all indexes in table 6 that are seasonally adjusted use direct seasonal adjustment, which produces a more complete elimination of seasonal movements than the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for stage-of-processing indexes are derived indirectly through the aggregative method, which combines movements of a wide variety of subproduct class (6-digit level) series.²

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

Beginning in January 1988, the PPI used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of nearly 900 seasonally adjusted series, only 16 interventions were performed in 1997.

For more information, see "Appendix A: Seasonal Adjustment Methodology at BLS," in the *BLS Handbook of Methods* (April 1997), Bulletin 2490 and (2) "Summary of Changes to the PPI's Seasonal Adjustment Methodology" in the January 1995 issue of *Producer Price Indexes*.

¹ Note that most broad commodity groupings and 8-digit individual commodities in table 6, as well as industry and Census product indexes in tables 4 and 5, are not seasonally adjusted and are, therefore, not included in this annual review.

² Tests previously conducted on the stage-of-processing indexes did not find significant residual seasonality.

Producer Price Index Data via Internet

The Bureau of Labor Statistics has made Producer Price Index series and news releases available via the Internet. The BLS provides Internet access through a world wide web homepage (WWW), a gopher site, and a file transfer protocol (FTP) service.

Retrieving PPI data from the WWW and gopher sites

Among other things, the WWW site offers news releases and most PPI historical data. Using a WWW browser, enter the BLS homepage address (<http://stats.bls.gov>). After clicking the "DATA" button on the homepage, six ways to retrieve PPI data are offered.

- **Most Requested Series** is a form-based application which allows the user to quickly obtain PPI time series data by selecting from a list of the most commonly requested time series including "All Commodities" and the stage-of-processing indexes (e.g., finished goods). Within each list, any one or all of the time series shown can be selected and date ranges and output options are chosen prior to executing the query.

- **Selective Access** is a form-based query application designed for users unfamiliar with the PPI coding structure. It guides the user through the PPI classification system by listing index titles and does not require use of commodity or industry (SIC) codes. The data retrieved are based on a query formulated by selecting the data characteristics from lists provided. The user also submits specified date ranges and output options.

- **News Releases** contains the most current press release produced by the PPI program. The release contains text explanations of aggregate index movement provided by PPI economists. It also contains preformatted data (tables 1, 2, 3, and 4) including most aggregates and selected commodity indexes.

- **Series Report** is a form-based application which uses PPI time series identifiers (commodity or SIC codes) as input in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for those users who are familiar with the format of PPI time series identifiers.

The PPI data use two basic formats to identify specific time series. For commodity codes and stage-of-processing codes use a "wpu" prefix (not seasonally adjusted) or

a “wps” prefix (seasonally adjusted). For industry product codes use a “pcu” prefix and a “#” between the fourth and fifth character of the product code. No spaces are required.

Example

Commodity code Will provide data for:

wpusop3000 Finished goods, not seasonally adjusted

wps063 Drugs and pharmaceuticals, seasonally adjusted

Product code Will provide data for:

pcu28__# Chemicals and allied products, not seasonally adjusted

pcu3711#111 Passenger cars

Note that the first product code uses two underscores as placeholders to complete the reference to a two-digit product code time series.

- **Economy at a Glance** is a table which contains current data on the various economic indicators produced by BLS. These key time-series can also be viewed graphically.

- **Gopher** is a link to the BLS Gopher server. Given the limitations on the amount of data the user can extract using any of the applications provided on the Web site, the Gopher server is ideal for those users requiring a large volume of time series data.

Data users are advised to first obtain the README file in the root directory and the “overview” file in the /pub directory. Help files are located in the /pub/doc directory. For commodity based PPI data (which appear in tables 1, 6, 7, and 8 in the PPI monthly detailed report) the program help file is wp.doc. For the industry-based PPI data (which appear in tables 4, 5, and 9 through 12 in the monthly report) the file is pc.doc.

The data available for download include:

- Commodity data files in the /pub/time.series/wp directory and the industry files in the /pub/time.series/pc directory.
- The latest PPI news release in the /pub/news.release directory.
- Seasonal factors and relative importance tables (/pub/special.requests). While the text files can be downloaded from the gopher site, the binary (spreadsheets) files can only be transferred using FTP (address: <ftp://stats.bls.gov>).
