PPI Detailed Report (ISSN 1099-2855; USPS 485-050) is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights.

To order this periodical for 1 year, cite *PPI Detailed Report* (WPPI) and send your check for \$39.00 (\$48.75 foreign) or provide your VISA or MasterCard number and expiration date to Superintendent of Documents, P.O. Box 371954, Pittsburgh, PA 15220-7954. Cost of the supplement only is \$33.00 domestic (\$ 41.25 foreign).

Subscribers will receive the next available subscription issue after their order is received. An acknowledgement card is sent to all customers after their subscription order is processed to let them know that they will receive the next available issue.

Please wait at least 6 weeks before inquiring about your order. Then write to Subscription Service Section, U.S. Government Printing Office, Stop: SSOM, Washington, DC 20402; telephone (202) 512-1800; or fax (202) 512-2168.

POSTMASTER: Send address changes to *PPI Detailed Report*, U.S. Government Printing Office, Washington, DC 20402-0001.

Price Highlights, 1999

Producer price indexes for crude, intermediate, and finished goods rose in 1999; surging energy prices were the driving force behind their acceleration. The finished goods index advanced 2.9 percent, after showing no change in 1998. The 1999 rise was the largest annual increase since a 5.7-percent advance in 1990. Energy prices gained 18.1 percent, following an 11.7-percent decrease during the previous 12 months. The index for finished consumer foods rose 0.8 percent, after a 0.1-percent increase in 1998. However, finished goods other than foods and energy—a category that includes both consumer goods and capital equipment—increased 0.9 percent in 1999, after gaining 2.5 percent a year earlier.

The index for intermediate materials, supplies, and components rose 3.7 percent, following a 3.3-percent decline in 1998. The acceleration in intermediate materials was also due primarily to rising prices for intermediate energy goods, which declined in the previous year. Also contributing to this acceleration were rising prices for nondurable and durable manufacturing materials, which turned up, after falling. The index for materials and components for construction rose more than in the prior year. Prices for intermediate foods and feeds fell less than in 1998. Excluding foods and energy, intermediate goods prices increased 1.9 percent, following a 1.6-percent decline in 1998. Prices for crude materials for further processing advanced 15.3 percent in 1999. As with finished and intermediate goods, much of the increase in crude goods can be attributed to rising prices for energy goods. Prices for crude goods other than foods and energy also turned up substantially. The index for crude foodstuffs and feedstuffs fell less than a year ago. (See table A.)

Energy goods. Over half the acceleration in prices for finished energy goods can be traced to a 74.8-percent surge in gasoline prices. In 1998, gasoline prices fell 33.1 percent. Prices for home heating oil jumped 89.4 percent, after a 36.1-percent decline last year. The indexes for residential natural gas, finished lubricants, and liquefied petroleum gas also turned up. The residential electric power index was the only finished energy component that fell in 1999. Petroleum-based products also led the acceleration at the intermediate stage-of-process. Jet fuel prices surged 90.9 percent, after falling for 2 consecutive years. The indexes for diesel fuel, liquefied petroleum gas, and residual fuel also turned up, following declines. Outside of the refined-petroleum sector, prices for commercial electric power, industrial natural gas, and commercial natural gas rose, after falling in 1998. The index for industrial electric power fell less in 1999. At the crude stage-of-processing, crude-oil prices rose 172.0

percent, after declining 48.6 percent a year earlier. The index for natural gas turned up 7.9 percent, following a 17.8-percent drop. By contrast, coal prices fell 9.3 percent, following a 1.2-percent decrease.

Foods and related products. Prices for finished consumer foods rose 0.8 percent in 1999, after a 0.1-percent increase in 1998. Leading the way, pork prices jumped 29.8 percent, following a 27.3-percent drop in 1998 and a 13.6-percent decline in 1997. This rebound can be traced to a dramatic 266.9-percent jump in the index for slaughter hogs. Also contributing to the increase in finished consumer foods was a 10.8-percent rise in beef and veal prices, which declined 2.7 percent in 1998. Contrasting rising meat prices, the dairy products index fell 11.1 percent. Prices for intermediate foods and feeds declined 4.2 percent, following a 7.3-percent drop in 1998. The index for prepared animal feeds fell 2.7 percent, after falling 20.4 percent in the prior year. Crude vegetable oil prices declined, on weak corn and soybean prices. The index for crude foodstuffs and feedstuffs edged down 0.1 percent in 1999, following an 11.0-percent drop during 1998. Slaughter cattle prices rose 19.4 percent, after falling 12.0 percent. Similarly, a large upturn for slaughter hog prices was posted in 1999. The indexes for corn and alfalfa hay fell less than in the previous year.

Finished goods other than foods and energy. The index for finished goods other than foods and energy increased 0.9 percent, after advancing 2.5 percent in 1998. Consumer goods other than foods and energy increased 1.2 percent, following a 4.2-percent gain in 1998, while the index for capital equipment rose 0.3 percent, after showing no change a year earlier. Most of the deceleration in finished consumer goods other than foods and energy was due to smaller price increases for cigarettes and prescription drugs. The cigarette index rose 9.6-percent in 1999, after jumping 49.4 percent during 1998, and prescription drug prices increased 0.8 percent, after gaining 20.9 percent a year ago. Price increases also slowed for book publishing, alcoholic beverages, periodical circulation, and household furniture. Conversely, prices rose more in 1999 than in the prior year for passenger cars, mobile homes, and newspaper circulation. Within capital equipment, the slight acceleration was led by civilian aircraft prices, which advanced 2.1 percent, following a 0.5-percent rise in 1998. Price increases also accelerated for commercial furniture, transformers and power regulators, and for agricultural machinery and equipment. On the other hand, price increases slowed for light motor trucks, heavy motor trucks, and industrial material handling equipment. The indexes for communication equipment and for x-ray and electromedical equipment fell more than in 1998.

Intermediate industrial materials. Within the nondurable manufacturing materials category, prices for plastic resins and materials, primary basic organic chemicals, paperboard, paper, and woodpulp turned up, after declining in the prior year. Leading the turnaround in durable manufacturing materials, prices for primary nonferrous metals (including copper and aluminum) turned up, following a drop a year ago. Also, the indexes for flat glass and steel mill products fell less than in 1998. Within materials and components for construction, over half of the acceleration was due to the index for softwood lumber, which turned up 10.1 percent in 1999, following a 10.1-percent decline last year. Prices for plastic construction products and nonferrous wire and cable also turned up, after falling in 1998, and the indexes for gypsum products and millwork rose more than in the previous year.

Crude nonfood materials less energy. Prices for crude nonfood materials less energy turned up 14.0 percent in 1999, after declining 16.0 percent in the prior calendar year. Over half of the acceleration in this index was due to price increases for iron and steel scrap and for wastepaper. The index for iron and steel scrap rose 40.0 percent, following a 39.9-percent drop in the previous year. The wastepaper index jumped 110.5 percent, following a 28.9-percent fall in 1998. Upturns in the indexes for aluminum base scrap, copper ores, softwood logs, and copper base scrap also contributed to the price acceleration in basic industrial materials in 1999.

Health care. The rate of increase in prices received by offices of physicians slowed from 2.6 percent in 1998 to 2.1 percent in 1999. The index for general medical and surgical hospitals rose at a somewhat faster rate—1.8 percent—versus a 1.3-percent

gain in 1998. Prices received by psychiatric hospitals rose 0.9 percent in 1999, after increasing 0.5 percent in 1998, while the index for specialty hospitals (except psychiatric) advanced 2.7 percent in 1999, following a 2.3-percent rise in the prior year.

Distribution. The robust U.S. economy grew over 4.0 percent during 1999, and coupled with higher fuel costs, permitted the distribution service industries to set higher prices. Of the 20 distribution service industries for which PPI publishes price indexes, all but 3 industries showed increased prices in 1999. In 1998, all but 4 industries raised prices. Freight transportation arrangement, freight transportation on the Great Lakes-St. Lawrence Seaway, and crude petroleum pipelines were the 3 industries with declining prices in 1999.

Real estate. Among real estate industries, the index for operators and lessors of nonresidential buildings rose 5.7 percent in 1999, after registering a 1.2-percent increase in 1998. The index for real estate agents and managers increased 1.5 percent in 1999, after rising 2.6 percent in the previous year. Plentiful employment, rising income, and higher limits on Federal Housing Administration loans led to increasing home sales and rising fees for appraisals and commissions on sales.

Professional, scientific, and technical. The functions performed by advertising, legal, and accounting firms are required in the day-to-day operations of most companies, and professional, scientific, and technical firms from the United States maintain a worldwide client base. Economic strength has also served to further increase demand for activities such as engineering and architectural services. The indexes for each of these industries increased in 1999, for the third consecutive year.

Communications. The index for radio broadcasting advanced 7.7 percent in 1999, following a 0.8-percent rise in the previous year. The index for cable and other pay television services rose 3.3 percent, after a 3.7-percent increase in 1998. The index for telephone communications (except radio telephone) fell 3.0 percent, following a 1.7-percent drop in 1998. Competition among long-distance carriers forced public-switched toll prices down 5.8 percent. By contrast, the index for local service (except private lines) increased 0.2 percent. Introduced in June of 1999, the index for wireless telecommunications fell 3.0 percent during its first 6 months of publication, on the strength of a 4.0-percent drop in prices for cellular and other wireless voice grade services.

Other service industries. The index for passenger car rental (without drivers) turned up 3.8 percent in 1999, after falling 4.0 percent in 1998. Prices received by hotels and motels rose 2.8 percent, following a 4.2-percent gain in the prior year. Prepackaged software prices showed a 2.4-percent decrease in 1999, after a 0.9-percent rise in its first year of publication. The index for property and casualty insurance increased 1.1 percent, mainly due to a 2.8-percent increase in homeowners insurance. By contrast, the index for life insurance carriers declined 0.3 percent from December 1998 to December 1999.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents.

² Industry and product class indexes may include products not shown separately.

³ Not available.

n.e.c. = Not elsewhere classified.

mfpn = Made from purchased materials.

n.s.k. = Not specified by kind.

Note: Indexes in this table are calculated by a revised methodology. See Technical Note at the back of this publication. The annual average calculation method for the PPIR differs from that of the PPI (table 4). The PPIR method averages the unrounded monthly indexes, and also includes unpublished monthly data. Therefore, the annual averages may not agree with those computed by averaging the monthly indexes as shown above.

⁴ The special index for 9331 in which prices reflect premiums only, contrasts with the index shown elsewhere in this table for SIC 6331, where prices reflect premiums plus the amount of investment income earned on the invested portion of the premium.

¹ Monthly data and annual averages have been recalculated to incorporate late reports and corrections by respondents. Indexes in this table are derived from the primary product indexes in table 3 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced

by the mining and manufacturing sectors of the economy, excluding capital equipment. Because they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of *Producer Price Indexes* for July 1986.

inter-industry shipment patterns from the 1977 input/output relationships.

¹ Monthly data and annual averages have been recalculated to incorporate late reports and corrections by respondents. Indexes in this table are derived from the product indexes in table 3. These indexes are composed of the goods used by the industries in each of the industry stage-of-process output indexes

as shown by the 1977 input/output relationships. These material inputs include only domestic material input and do not include any imported materials which may be used.

¹ The relative importance of a component of the PPI represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials. This value is expressed as a percentage of the total weight of the SOP category. The "Revised" column shows relative importance figures for December 1999, based on 1992 shipment values from the *Census of Manufactures* and other sources, and reflects all sample revisions effective

January 2000. The "Former" column provides relative importance figures for the same month before any sample revisions. Groupings and sub-totals may not add exactly to totals because of rounding. A dash in the "Former" column indicates that the series was introduced in January 2000, and a dash in the "Revised" column indicates that the series was discontinued as of January 2000. The value "0.000" represents any percentage less than 0.0005.

¹ The relative importance of a component of the PPI represents its value weight that is allocated to a particular stage-of-processing (SOP) category--finished goods, intermediate materials, or crude materials. This value is expressed as a percentage of the total weight of the SOP category. The "Revised" column shows relative importance figures for December 1999, based on 1992 shipment values from the *Census of Manufactures* and other sources, and reflects all sample revisions effective

January 2000. The "Former" column provides relative importance figures for the same month before any sample revisions. Groupings and sub-totals may not add exactly to totals because of rounding. The value of "0.000" represents either a percentage less than 0.0005, or a grouping newly introduced or deleted in January 2000. Table 9 explicitly identifies which groupings are newly introduced, deleted, or have relative importance values of less than 0.0005.

¹ All relative importance figures shown in this table are expressed as a percentage of the All Commodities index. The "Revised" column shows relative importance figures for December 1999, based on 1992 shipment values from the *Census of Manufactures* and other sources, and reflects all sample revisions effective January 2000. The "Former" column provides relative importance figures for the same month, but before any sample revisions. A dash in the "Former" column indicates that the series was introduced in January 2000, and a dash in the

"Revised" column indicates that the series was discontinued as of January 2000. Individual items and sub-totals may not add exactly to totals because of rounding. The value "0.000" represents any percentage less than 0.0005. ² The relative importance data for the three major SOP groupings—finished goods, intermediate materials, and crude materials—do not add up to 100.000 because they exclude the portion of goods allocated to government purchases and exports.

Technical Note

Brief Explanation of Producer Price Indexes

The term Producer Price Index (PPI) refers to a family of indexes that measure the average change over time in the selling prices received by domestic producers of goods and services. The PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI); CPIs measure price change from the purchaser's perspective. Sellers' and purchasers' prices may differ due to government subsidies, sales and excise taxes, and distribution costs.

Over 10,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors of the U.S. economy. New PPIs are gradually being introduced for the products of industries in the transportation, utilities, trade, finance, and services sectors of the economy.

Over 100,000 price quotations per month are organized into 3 sets of producer price indexes: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure organizes products by class of buyer and degree of fabrication. The commodity structure organizes products by similarity of end use or material composition. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

Stage-of-Processing Indexes

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods, such as eggs and fresh vegetables, as well as processed foods, such as bakery products and meats. Other finished consumer goods include durable goods, such as automobiles, household furniture, and appliances and nondurable goods, such

as apparel and home heating oil. Capital equipment includes producer durable goods, such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and

components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Commodity Indexes

The commodity classification structure of the Producer Price Index organizes products by similarity of end use or material composition, regardless of their industry of origin. Fifteen major commodity groupings (2-digit level) make up the all commodities index. Each major commodity grouping includes (in descending order of aggregation) subgroups (3-digit), product classes (4-digit), subproduct classes (6-digit), and individual items (8-digit).

Nearly all 8-digit commodities under the traditional commodity coding system are now derived from corresponding industry-classified product indexes. In such instances, movements in the traditional commodity price indexes are identical to movements of their counterparts. Therefore, monthly percent changes for corresponding indexes will be virtually identical even though their respective index levels may differ.

Industry Net-Output Price Indexes

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC). Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 3 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product indexes. Every industry has

primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, most industries have secondary product indexes that show changes in prices received by establishments classified in the industry for products chiefly made in some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 3 correspond to 8-digit commodity indexes in table 4. In these cases, movement of the latter indexes are calculated on the basis of movement of their counterparts in table 3. Although most such indexes continue to be published in table 4 on a base period of 1982=100 or some later base, corresponding indexes in table 3 are published on a base of the month of their introduction.

Data Collection

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. The Bureau of Labor Statistics (BLS) strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Weights

Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing indexes) calculated from traditional commodity groupings, currently reflect 1992 values of shipments as reported in the *Census of Manufactures* and other sources. From January 1992 through December 1995, PPI weights were derived from 1987 shipment values. Industry indexes shown in table 3 are also now calculated with 1992 net output weights. This periodic update of the

value weights used to calculate the PPI is done to accurately reflect changes in production and marketing patterns in the economy. Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes, such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

Price Index Reference Base

Effective with publication of January 1988 data, many important PPI series (including stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not alter any changes to previously published percent changes for affected PPI series. (See "Calculating Index Changes" below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, "Producer Prices," in *BLS Handbook of Methods* (April 1997), Bulletin 2490. Reprints are available from the Bureau of Labor Statistics on request.

Calculating Index Changes

Each index measures price changes from a reference period that equals 100.0 (1982 or some later month). An increase of 5.5 percent from the reference period in the finished goods price index, for example, is shown as 105.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$105.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods today are 10 percent lower than they were in 1982.

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points, because index point changes

are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes:

Index point changes

Finished goods price index	107.5
Less previous index	104.0
Equals index point change	3.5

Index percent change

Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034 x 100
Equals percent change	3.4

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted, as well as unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy, because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts, such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, September 1991, available on request from BLS.)

In most cases, seasonal factors used in computing seasonally adjusted indexes have, in the past, been derived using the X-11-ARIMA Seasonal Adjustment Method. However, the PPI program upgraded to X-12, beginning in 1998. Each year,

the seasonal status of most commodity indexes is re-evaluated to reflect more recent price behavior.¹ For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data for the previous 5 years. These updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for stage-of-processing indexes are derived indirectly through the aggregative method that combines movements of a wide variety of subproduct class (6-digit level) series.²

Seasonally adjusted indexes can become problematic, when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products, such as automobiles and steel.

Beginning in January 1988, the PPI used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data, prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of nearly 900 seasonally adjusted series, only 16 interventions were performed in 1997.

For more information, see (1) "Appendix A: Seasonal Adjustment Methodology at BLS," in the *BLS Handbook of Methods* (April 1997), Bulletin 2490, and, (2) "Summary of Changes to the PPI's Seasonal Adjustment Methodology" in the January 1995 issue of *Producer Price Indexes*.

¹ Note that most broad commodity groupings and 8-digit individual commodities, as well as industry and census product indexes are not seasonally adjusted and are, therefore, not included in this annual review.

² Tests previously conducted on the stage-of-processing indexes did not find significant residual seasonality.

Producer Price Index Data Via the Internet

The Bureau of Labor Statistics has made producer price index series and news releases available via the Internet. BLS provides Internet access through a World Wide Web (WWW) homepage and a file transfer protocol (FTP) service.

Retrieving PPI data from the BLS WWW site

Among other things, the BLS WWW site offers news releases and most PPI historical data. Enter the BLS homepage address <http://stats.bls.gov> using a WWW browser. After clicking the "Data" button on the homepage, there are five ways to retrieve PPI data.

- **Most Requested Series** is a form-based application that allows the user to quickly obtain PPI time series data by selecting from a list of the most commonly requested time series, including "all commodities" and the stage-of-processing indexes (e.g., finished goods). Within each list, any one or all of the time series shown can be selected. The user can choose date ranges and output options, prior to executing the query.

- **Selective Access** is a form-based query application designed for users unfamiliar with the PPI coding structure. It guides the user through the PPI classification system by listing index titles and does not require use of commodity or industry (SIC) codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. The user can choose date ranges and output options prior to executing the query.

- **News Releases** contains the most current press release produced by the PPI program. The release contains text explanations of aggregate index movement provided by PPI economists. It also contains pre-formatted data including most aggregates and selected commodity indexes.

- **Series Report** is a form-based application that uses PPI time series identifiers (commodity or SIC codes) as input in extracting data, according to a specified set of date ranges and output options. This application provides the most efficient path for those users who are familiar with the format of PPI time series identifiers. Up to 300 indexes can be extracted at one time.

For PPI data, there are two basic formats to identify specific time series. For commodity codes and stage-of-processing codes, enter a "wpu" prefix (not seasonally adjusted) or a "wps" prefix (seasonally adjusted). For industry product codes, enter

a “pcu” prefix and a “#” between the fourth and fifth characters of the product code. In both cases, no spaces are required.

Example:

Commodity code	Will provide data for:
wpusop3000	Finished goods, not seasonally adjusted
wps063	Drugs and pharmaceuticals, seasonally adjusted
Product code	Will provide data for:
pcu28__#	Chemicals and allied products, not seasonally adjusted
pcu3711#111	Passenger cars, not seasonally adjusted

Note that the first product code uses two underscores as placeholders to complete the reference to a two-digit product code time series.

• **Economy at a Glance** is a table which contains current data on various economic indicators produced by BLS. The user can also view these key time series graphically.

Retrieving PPI data from the BLS FTP site

Given limitations on the amount of data users can extract from applications provided on the BLS WWW site, the FTP server is best suited for those requiring access to either a large volume of time series data or other PPI-related documentation (e.g., seasonal factor and relative importance tables). For increased efficiency, it is

suggested that users download files without opening, if their Internet browser permits. Enter *ftp://ftp.bls.gov* to access the FTP site.

Data and documentation available for download include:

	Directory:
• SIC current series	<i>/pub/time.series/pc</i>
• SIC discontinued series	<i>/pub/time.series/pd</i>
• Commodity series	<i>/pub/time.series/wp</i>
• Special requests	<i>/pub/special.requests/ppi</i>
• Latest news release	<i>/pub/news.release/ppi.txt</i>

The FTP site maintains files to help with searches and downloads. These files are centrally located in the */pub/doc* directory. Within this directory, go to the *overview.doc* file for an overview relating to all BLS data available through the FTP site. For *commodity-based PPI data* (which appear in tables 1, 2, 6, 7, and 8 of the PPI monthly detailed report), the program help file is *wp.doc*. For *industry-based PPI data* (which appear in tables 4, 5, 9, 10, and 11 of the monthly PPI report), the file is *pc.doc*. For industry-based time series that have been discontinued, go to *pd.doc*. (These and other help files are also maintained within each of the five directories listed above.)
