PPI Detailed Report (ISSN 1099-2855; USPS 485-050) is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights.

To order this periodical for 1 year, cite *PPI Detailed Report* (WPPI) and send your check for \$55 (\$68.75 foreign) or provide your VISA or MasterCard number and expiration date to Superintendent of Documents, P.O. Box 371954, Pittsburgh, PA 15220-7954. Cost of the supplement only is \$40 domestic (\$50 foreign).

Subscribers will receive the next available subscription issue after their order is received. An acknowledgement card is sent to all customers after their subscription order is processed to let them know that they will receive the next available issue.

Please wait at least 6 weeks before inquiring about your order. Then write to Subscription Service Section, U.S. Government Printing Office, Stop: SSOM, Washington, DC 20402; telephone (202) 512-1800; or fax (202) 512-2168.

POSTMASTER: Send address changes to *PPI Detailed Report*, U.S. Government Printing Office, Washington, DC 20402-0001.

Price Highlights, 2000

The Producer Price Index for Finished Goods advanced 3.6 percent in 2000, after rising 2.9 percent in 1999 and remaining unchanged in 1998. The calendar-year 2000 increase for the finished goods index was the largest annual gain since a 5.7-percent jump in 1990. Prices for finished energy goods increased 16.6 percent in 2000, after advancing 18.1 percent during the previous 12-month period. After registering a 0.8-percent rise in 1999, the index for finished consumer foods moved up 1.7 percent in 2000. Prices for finished goods excluding foods and energy—a category that includes both consumer goods and capital equipment—advanced 1.3 percent in 2000, following a 0.9-percent increase during the prior 12-month period.

At the earlier stages of processing, the Producer Price Index for intermediate goods rose 4.1 percent in 2000, after increasing 3.7 percent in 1999. Prices for crude goods advanced 35.5 percent, after rising 15.3 percent a year earlier. The indexes for energy items and food-related materials at the crude and intermediate stages of processing also moved up in 2000. Excluding foods and energy, intermediate goods prices rose 1.6 percent in the most recent calendar year. By contrast, the index for crude materials other than foods and energy fell 5.5 percent for the same period. (See table A.)

Energy goods. The Producer Price Index for finished energy goods rose 16.6 percent in 2000, following an 18.1-percent advance in 1999. Prices for intermediate energy goods rose 19.0 percent, after rising 19.6 percent a year earlier. The crude energy goods index advanced 85.6 percent in 2000, following a 36.9-percent gain during the prior 12-month period.

The natural gas index exhibited a 192.6-percent rate of increase in calendar-year 2000, as demand outpaced supply and led to declining natural gas reserves. This price pressure pushed residential, commercial, and industrial natural gas prices to unprecedented heights during 2000: the index for residential natural gas advanced 41.8 percent in 2000; commercial natural gas prices rose 56.0 percent; and the industrial natural gas index jumped 91.9 percent for the 12 months ending December 2000. Among other energy items, prices for liquefied petroleum gas rose 49.3 percent, following an 87.0-percent gain a year earlier. The coal index showed no change in 2000, after dropping 9.3 percent in the prior 12-month period. Crude petroleum prices increased 11.0 percent from December 1999 to December 2000, after surging 172.0

percent in the previous calendar year. As for refined-petroleum products, the jet fuel index advanced 42.6 percent in 2000, diesel fuel prices rose 39.8 percent, the gasoline index gained 17.2 percent, and home heating oil prices jumped 37.0 percent. In the utility electric power sector, residential electric power prices increased 3.2 percent in 2000, following a 0.5-percent decline in 1999. Over the same period, the index for commercial electric power advanced 4.4 percent, following a 0.6-percent gain a year earlier, while industrial electric power prices rose 4.9 percent, after a 0.1-percent dip during the prior 12-month period. High natural gas prices encouraged electricity producers to increase user rates through fuel-cost adjustments.

Food and related products. The Producer Price Index for finished consumer foods rose 1.7 percent in 2000, following a 0.8-percent gain in the previous year. The majority of this acceleration can be attributed to higher year-2000 prices for dairy products, beef and veal, pork, bakery products, and eggs for fresh use. Led by rising prices for prepared animal feeds, the index for intermediate foods and feeds turned up 3.6 percent in 2000, after falling 4.2 percent a year earlier. At the crude stage of process, the index for foodstuffs and feedstuffs advanced 7.4 percent, after edging

down 0.1 percent in 1999. Price increases for fluid milk, corn, soybeans, wheat, slaughter cattle, and slaughter hogs contributed to this turnaround.

Finished goods other than foods and energy. Price advances for finished goods other than foods and energy accelerated from a 0.9-percent rate of increase in 1999 to a 1.3-percent rate in 2000. The index for finished consumer goods other than foods and energy rose 1.4 percent, following a 1.2-percent increase in 1999. In this category, prices for items such as alcoholic beverages, prescription drugs, and light trucks rose more than they did a year earlier. The capital equipment index moved up 1.2 percent for the 2000 calendar year, after gaining 0.3 percent in 1999. Rising prices were also observed for civilian aircraft, commercial furniture, industrial material handling equipment, heavy trucks, agricultural machinery, and construction machinery. Partly offsetting the gains in finished goods other than foods and energy, passenger car prices turned down 0.7 percent during 2000, after rising 1.2 percent during the previous 12-month period. Computer prices fell 14.2 percent for the same period.

Intermediate industrial materials. The Producer Price Index for intermediate materials other than foods and energy rose 1.6 percent in 2000, following a 1.9-percent gain in 1999. The index for durable manufacturing materials edged up 0.2 percent, after advancing at a faster 2.4-percent rate a year earlier. Within this category, prices for building paper and board and cement turned down in 2000. The indexes for copper cathode and refined copper and for copper and brass mill shapes increased less in 2000 than they did in the prior year. Plywood prices fell more in 2000 than they did in 1999. By contrast, the rate of decline in prices for steel mill products slowed to a 0.6-percent rate, compared with a 2.4-percent rate of decline a year earlier. The index for materials and components for construction inched up 0.1 percent in

2000, after advancing 2.2 percent in 1999. The price deceleration for this category was primarily due to the indexes for softwood lumber and gypsum products, which turned down in 2000. During the same period, price increases slowed for plastic construction products, millwork, and fabricated structural metal shapes. Conversely, the index for nonferrous wire and cable rose more in 2000 than it did a year earlier. Prices for nondurable manufacturing materials increased 4.1 percent in 2000, following a 4.0-percent gain in 1999. Explaining this advance, rising prices for industrial chemicals, paperboard, nitrogenates, and paper outweighed price declines for phosphates, inedible fats and oils, and medicinal and botanical chemicals.

Crude nonfood materials less energy. After a 14.0-percent rise in 1999, the Producer Price Index for basic industrial materials fell 5.5 percent in 2000. Prices for iron and steel scrap dropped 28.8 percent, following a 40.0-percent surge a year earlier. The indexes for wastepaper, aluminum base scrap, and softwood logs, bolts, and timber also turned down, after rising over the previous 12-month period. Conversely, raw cotton prices turned up 30.2 percent in 2000, following a 20.8-percent decline in the prior year.

Selected service industries. Among services industries in 2000, price increases were registered by the industries for general medical and surgical hospitals, operators and lessors of nonresidential buildings, property and casualty insurance, engineering services, hotels and motels, scheduled air transportation, truck rental and leasing, railroad line-haul operations, and water transportation of freight on the Mississippi River. Conversely, falling prices were observed for the industries for telephone communications (except radiotelephone), wireless telecommunications, life insurance carriers, and psychiatric hospitals.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents.

² Industry and product class indexes may include products not shown separately.

³ Not available.

n.e.c. = Not elsewhere classified.

m.p.m. = Made from purchased materials.

n.s.k. = Not specified by kind.

Note: Indexes in this table are calculated by a revised methodology. See Technical Note at the back of this publication. The annual average calculation method for the PPIR differs from that of the PPI (table 4). The PPIR method averages the unrounded monthly indexes, and also includes unpublished monthly data. Therefore, the annual averages may not agree with those computed by averaging the monthly indexes as shown above.

⁴ The special index for 9331 in which prices reflect premiums only, contrasts with the index shown elsewhere in this table for SIC 6331, where prices reflect premiums plus the amount of investment income earned on the invested portion of the premium.

¹ Monthly data and annual averages have been recalculated to incorporate late reports and corrections by respondents. Indexes in this table are derived from the primary product indexes in table 3 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the

economy, excluding capital equipment. Because they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of *Producer Price Indexes* for July 1986.

¹ Monthly data and annual averages have been recalculated to incorporate late reports and corrections by respondents. Indexes in this table are derived from the product indexes in table 3. These indexes are composed of the goods used by the industries in each of the industry stage-of-process output indexes

as shown by the 1977 input/output relationships. These material inputs include only domestic material input and do not include any imported materials which may be used.

¹ The relative importance of a component of the PPI represents its value weight that is allocated to a particular stage-of-processing (SOP) category--finished goods, intermediate materials, or crude materials. This value is expressed as a percentage of the total weight of the SOP category. The "Revised" column shows relative importance figures for December 2000, based on 1992 shipment values from the *Census of Manufactures* and other sources, and reflects all sample revisions effective January 2001. The "Former" column provides relative importance

figures for the same month before any sample revisions. Groupings and sub-totals may not add exactly to totals because of rounding. A dash in the "Former" column indicates that the series was introduced in January 2001, and a dash in the "Revised" column indicates that the series was discontinued as of January 2001. The value "0.000" represents any percentage less than 0.0005.

¹ The relative importance of a component of the PPI represents its value weight that is allocated to a particular stage-of-processing (SOP) category--finished goods, intermediate materials, or crude materials. This value is expressed as a percentage of the total weight of the SOP category. The "Revised" column shows relative importance figures for December 2000, based on 1992 shipment values from the *Census of Manufactures* and other sources, and reflects all sample revisions effective January 2001. The "Former" column provides relative

importance figures for the same month before any sample revisions. Groupings and sub-totals may not add exactly to totals because of rounding. The value "0.000" represents either a percentage less than 0.0005, or a grouping newly introduced or deleted in January 2001. Table 9 explicitly identifies which groupings are newly introduced, deleted, or have relative importance values of less than 0.0005.

¹ All relative importance figures shown in this table are expressed as a percentage of the All Commodities index. The "Revised" column shows relative importance figures for December 2000, based on 1992 shipment values from the *Census of Manufactures* and other sources, and reflects all sample revisions effective January 2001. The "Former" column provides relative importance figures for the same month, but before any sample revisions. A dash in the "Former" column indicates that the series was introduced in January 2001, and a dash in the

"Revised" column indicates that the series was discontinued as of January 2001. Individual items and sub-totals may not add exactly to totals because of rounding. The value "0.000" represents any percentage less than 0.0005.

² The relative importance data for the three major SOP groupings--finished goods, intermediate materials, and crude materials--do not add up to 100.000 because they exclude the portion of goods allocated to government purchases and exports.

Technical Note

Brief Explanation of Producer Price Indexes

The term Producer Price Index (PPI) refers to a family of indexes that measure the average change over time in the selling prices received by domestic producers of goods and services. The PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI); CPIs measure price change from the purchaser's perspective. Sellers' and purchasers' prices may differ due to government subsidies, sales and excise taxes, and distribution costs.

More than 10,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors of the U.S. economy. New PPIs are gradually being introduced for the products of industries in the transportation, utilities, trade, finance, and services sectors of the economy.

More than 100,000 price quotations per month are organized into three sets of producer price indexes: (1) stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure organizes products by class of buyer and degree of fabrication. The commodity structure organizes products by similarity of end use or material composition. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

Stage-of-Processing Indexes

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances; and nondurable goods such

as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration on the previous page shows examples of how products are classified by stage of processing.

Commodity Indexes

The commodity classification structure of the Producer Price Index organizes products by similarity of end use or material composition, regardless of their industry of origin. Fifteen major commodity groupings (2-digit level) make up the all commodities index. Each major commodity grouping includes (in descending order of aggregation) subgroups (3-digit), product classes (4-digit), subproduct classes (6-digit), and individual items (8-digit).

Nearly all 8-digit commodities under the traditional commodity coding system are now derived from corresponding industry-classified product indexes. In such instances, movements in the traditional commodity price indexes are identical to movements of their counterparts. Therefore, monthly percent changes for corresponding indexes will be virtually identical even though their respective index levels may differ.

Industry Net-Output Price Indexes

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC). Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 3 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments

classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, most industries have secondary product indexes that show changes in prices received by establishments classified in the industry for products chiefly made in some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 3 correspond to 8-digit commodity indexes in table 4. In these cases, movements of the latter indexes are calculated on the basis of movements of their counterparts in table 3. Although most of these indexes continue to be published in table 4 on a base period of 1982=100 or some later base, corresponding indexes in table 3 are published on a base of the month of their introduction.

Data Collection

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. The Bureau of Labor Statistics (BLS) strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

The BLS periodically updates the PPI sample of survey respondents to better reflect current conditions when the structure, membership, technology, or product mix of an industry shifts significantly and to spread reporting burden among smaller firms. Results of these resampling efforts are incorporated into the PPI every January and July.

As part of an ongoing effort to expand coverage to sectors of the economy other than mining and manufacturing, an increasing number of service sector industries have been introduced into the PPI. The following list of recently introduced service industries includes the month in which an article describing the industry's content appeared in the *PPI Detailed Report*:

Weights

Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing indexes) calculated from traditional commodity groupings, currently reflect 1992 values of shipments as reported in the *Census of*

Manufactures and other sources. From January 1992 through December 1995, PPI weights were derived from 1987 shipment values. Industry indexes shown in table 3 are also now calculated with 1992 net output weights. This periodic update of the value weights used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy. Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

Price Index Reference Base

Effective with publication of January 1988 data, many important PPI series (including stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not alter any changes to previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, "Producer Prices," in *BLS Handbook of Methods* (April 1997), Bulletin 2490. Reprints are available from the Bureau of Labor Statistics on request.

Calculating Index Changes

Each index measures price changes from a reference period which equals 100.0 (1982 or some later month). An increase of 5.5 percent from the reference period in the finished goods price index, for example, is shown as 105.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$105.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers

of finished goods today are 10 percent lower than they were in 1982.

Movements of price indexes from one month to another are usually expressed as percent changes, rather than as changes in index points, because index point changes are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes.

<i>Index point changes</i>	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5

<i>Index percent change</i>	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034×100
Equals percent change	3.4

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted, and unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy, because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information that can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, September 1991, available on request from BLS.)

In most cases, seasonal factors used in computing seasonally adjusted indexes

have, in the past, been derived using the X-11-ARIMA Seasonal Adjustment Method. However, the PPI program upgraded to X-12 beginning in 1998. Each year, the seasonal status of most commodity indexes is re-evaluated to reflect more recent price behavior.¹ For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data for the previous 5 years. These updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for stage-of-processing indexes are derived indirectly through the aggregative method, which combines movements of a wide variety of subproduct class (6-digit level) series.²

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

Since January 1988, the PPI has used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of nearly 900 seasonally adjusted series, only 16 interventions were performed in 1997.

For more information, see (1) "Appendix A: Seasonal Adjustment Methodology at BLS," in the *BLS Handbook of Methods* (April 1997), Bulletin 2490 and (2) "Summary of Changes to the PPI's Seasonal Adjustment Methodology" in the January 1995 issue of *Producer Price Indexes*.

¹ Note that most broad commodity groupings and 8-digit individual commodities, as well as industry and census product indexes, are not seasonally adjusted and are, therefore, not included in this annual review.

² Tests previously conducted on the stage-of-processing indexes did not find significant residual seasonality.

Producer Price Index Data Via the Internet

The Bureau of Labor Statistics has made producer price index series and news releases available via the Internet. BLS provides Internet access through a World Wide Web (WWW) homepage and a file transfer protocol (FTP) service.

Retrieving PPI data from the BLS WWW site

Among other things, the BLS WWW site offers news releases and most PPI historical data. Enter the BLS homepage address <http://stats.bls.gov> using a WWW browser. After clicking the "Data" button on the homepage, the user can retrieve PPI data in any of six ways:

- **Most Requested Series** is a form-based application which allows the user to quickly obtain PPI time series data by selecting from a list of the most commonly requested time series, including "all commodities" and the stage-of-processing indexes (e.g., finished goods). Within each list, any one or all of the time series shown can be selected. The user can choose date ranges and output options prior to executing the query.

- **Selective Access** is a form-based query application designed for users unfamiliar with the PPI coding structure. It guides the user through the PPI classification system by listing index titles and does not require use of commodity or industry (SIC) codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. The user can choose date ranges and output options prior to executing the query.

- **News Releases** contains the most current press release produced by the PPI program. The release contains text explanations of aggregate index movement provided by PPI economists. It also contains preformatted data, including most aggregates and selected commodity indexes.

- **Series Report** is a form-based application that uses PPI time series identifiers (commodity or SIC codes) as input in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for those users who are familiar with the format of PPI time series identifiers. Up to 300 indexes can be extracted at one time.

For PPI data, there are two basic formats to identify specific time series. For commodity codes and stage-of-processing codes, enter a "wpu" prefix (not seasonally adjusted) or a "wps" prefix (seasonally adjusted). For industry product codes, enter a "pcu" prefix and a "#" between the fourth and fifth characters of the product code. *In both cases, no spaces are required.*

Example:

Commodity code Will provide data for:

wpusop3000	Finished goods, not seasonally adjusted
wps063	Drugs and pharmaceuticals, seasonally adjusted

Product code Will provide data for:

pcu28__#	Chemicals and allied products, not seasonally adjusted
pcu3711#111	Passenger cars, not seasonally adjusted

Note that the first product code uses two underscores as placeholders to complete the reference to a 2-digit product code time series.

- **FTP Site.** Given limitations on the amount of data users can extract from applications provided on the BLS WWW site, the FTP server is best suited for those requiring access to either a large volume of time series data or other PPI related documentation (e.g., seasonal factor and relative importance tables). For increased efficiency, it is suggested that users download files without opening, if their Internet browser permits. Enter <ftp://ftp.bls.gov> to access the FTP site.

Data and documentation available for download include:

	Directory:
• SIC current series	/pub/time.series/pc
• SIC discontinued series	/pub/time.series/pd
• Commodity series	/pub/time.series/wp
• Special requests	/pub/special.requests/ppi
• Latest news release	/pub/news.release/ppi.txt

The FTP site maintains files to help with searches and downloads. These files are centrally located in the [/pub/doc](#) directory. Within this directory, go to the [overview.doc](#) file for an overview relating to all BLS data available through the FTP site. For *commodity-based PPI data* (which appear in tables 1, 2, 4, and 5 of this supplement), the program help file is [wp.doc](#). For *industry-based PPI data* (which

appear in tables 3, 6, 7, and 8 of this document, the file is *pc.doc*. For industry-based time series that have been discontinued, go to *pd.doc*. (These and other help files are also maintained within each of the five directories listed above.)

- ***Economy at a Glance*** is a table that contains current data on various economic indicators produced by BLS. The user also can view these key time series graphically.
