The following example will illustrate the manner of reading the chart:

To find the rainfall of Texas:

Beginning with the extreme eastern portion of the coast, it will be found that a line marked 30 inches corresponds to the line of 60 inches. Moving westward, the line for 10 inches is found directly west of this line. A line marked 20 inches corresponds to the line of 60 inches and over is found directly west of the line for 20 inches. West of this line the precipitation diminishes from east to west, regularly at first, as indicated by the various line figures. After the line for 10 inches, etc., but after the line of 20 inches is reached, the distribution becomes somewhat irregular, and finally is reduced to about 10 inches in the extreme western part of the State.

The amount of rain that falls in dry years ranges from 20 to 30 per cent of the normal; in very wet years the fall may be as high as 150 per cent of the normal.
