# ANALYSIS OF CIVIL WORKS PROGRAM STATISTICS

**S**TATISTICS for the Civil Works Program heretofore published were, of necessity, subject to revision pending the disposition of claims in Washington and the completion of adjustments to statistical reports submitted by the States. This report presents an analysis of final statistics together with a statement of the objectives of the program and the procedures under which it operated.

The statistics for the Civil Works Program were obtained in part from central office records of amounts of Federal funds made available for the various aspects of the program and the sources of these funds, but most of the figures are based on detailed reports on employment and projects submitted by the State Civil Works Administrations. All tables are shown in the appendix.

#### Operation of the Program

The Civil Works Administration was established by Executive order on November 9, 1933, by the authority vested in the President under Title II of the National Industrial Recovery Act of June 16, 1933. The program was Federally administered through State and local Civil Works Administrations. Regional engineers aided the State organizations with technical advice and guided them in adherence to regulations and policies laid down by the Federal Administration. Although technically the Federal and State Civil Works Administrations were entirely separate from the Federal Emergency Relief Administration and the State emergency relief agencies, they were very closely related. In most instances key personnel served both administrations.

The program was to provide work at regular wages for 4,000,000 unemployed persons in as short a time as possible, thereby stimulating purchasing power both directly through earnings and indirectly by the purchase of materials for the projects. Approximately 2,000,000 employable persons were to be transferred directly from relief rolls by December 1, 1933, and the other 2,000,000 were to be selected by local public employment offices from those in need of work but not actually receiving relief. It was believed that many of the latter would otherwise become relief cases during the winter months. Unlike the Emergency Relief Program, certification of need was not a prerequisite for assignment to jobs on CWA projects nor were earnings limited to the budgetary deficiency.

Ten days after the creation of the Civil Works Administration, employment had actually begun on the projects. The speed with which the program was put into operation brought about problems not inherent in a more slowly developed program. The Veterans' Administration, which at that time had the largest disbursing system in the Federal Government, cooperated in the quick establishment of disbursing procedures. In each State the disbursing agent for the Veterans' Administration became the State special disbursing officer for the Civil Works Administration and assistant disbursing officers were designated for various counties and cities. Where the specified pay-roll forms could not be printed in time to meet the first week's pay rolls, the State was allowed to borrow copies of other approved Government pay-roll forms. In many localities there was a shortage of the commercial supply of small tools and such equipment was issued from Army and Navy depots to aid in speeding up employment under the new program. Banks were urged by the President of the United States to cooperate in cashing without charge weekly pay checks of persons employed on CWA projects upon identification by cards issued to the payees.

Employment on the program increased rapidly until it reached a peak during the week ending January 18, 1934, after which gradual reductions occurred. Employment on State and local work projects was discontinued on March 31, and all other employment ended on or before July 14, 1934.

#### **Employment and Earnings**

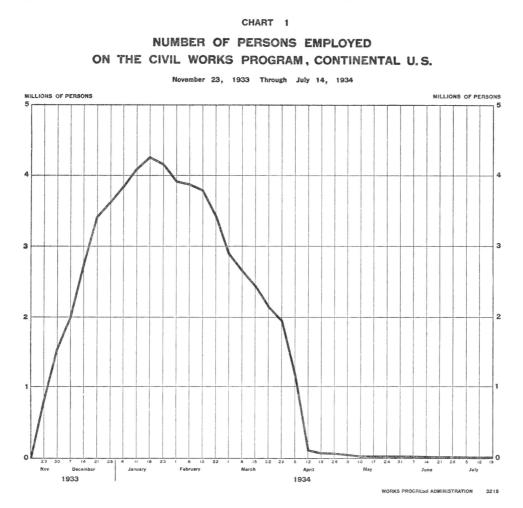

The first regulations governing employment on CWA projects, issued November 15, 1933, provided that persons in all except executive, administrative, supervisory, or clerical positions were to be employed on the basis of an 8-hour day and a 30-hour week, with certain modifications in remote localities where this exact requirement was not feasible. Clerical employees were permitted to work up to 39 hours per week. Wage rates were, in general, to be sufficient to provide for a standard of living in decency and comfort.

Minimum hourly wage rates were fixed in accordance with rules and regulations previously established for PWA projects by the Federal Emergency Administrator of Public Works. For this purpose, the United States was divided into three zones, Northern, Southern, and Central. Minimum hourly rates for skilled labor were \$1 in the Southern, \$1.10 in the Central, and \$1.20 in the Northern zone, and for unskilled 40, 45, and 50 cents, respectively. On road projects, rates conformed to those fixed by the State highway departments in accordance with the National Industrial Recovery Act. Rates of pay on clerical and white-collar jobs were those prevailing in the community, but were not less than \$12 per week in the Southern and \$18 in the Northern zone. The minimum for technical and supervisory employees ranged from \$18-\$35 per week in the Southern zone to \$24-\$45 in the Northern zone. Wages for Civil Works Service projects were the prevailing rates, but not less than 30 cents per hour. All these wage rate provisions were effective until March 2, 1934, when wages on all projects were established at the prevailing rates for the type of work done, but in no case less than 30 cents per hour.

The first employment quotas for each State were announced on November 16, 1933. These were determined on the basis of population and on the number of families receiving relief, a weighting of 75 percent being given to population and of 25 percent to the number of relief recipients. States used the same weighting in determining employment allotments within each State. In general, employment was given first to those then engaged on work relief. If the number of work relief cases was less than 50 percent of the allotment, additional direct relief cases were employed to bring it to this percentage. Because of local conditions some variation occurred in individual States in the timing and procedures used in filling their respective quotas.

Employment in the continental United States increased rapidly until it reached a peak of 4,263,644 during the week ending January 18, 1934, as shown in table 1 and chart 1. The peak in a number of individual States occurred in the preceding or subsequent week. Table 2 presents the number employed in each State, exclusive of those on administrative projects, during the week ending nearest the middle of each month.

Effective January 19, 1934, the maximum week was reduced to 24 hours for urban areas and 15 hours for rural areas. Substantial reductions in employment commenced about the middle of February. A good many of the

Digitized for FRASER https://fraser.stlouisfed.org Federal Reserve Bank of St. Louis

#### 7

Federal projects were terminated on February 15. Gradual reductions in weekly quotas for employment on all other projects were first made effective February 23. With the exception of persons employed on the remaining Federal projects and those necessary to the completion of records and reports, all employment was terminated on March 31. Federal projects ceased operation on April 28 but employment in State and local offices on the liquidation of the program continued until July 14.

Dissimilarities between the movements of employment and earnings are reflected in the series representing average weekly earnings. Averages shown in table 4 were derived by dividing total earnings for the different groups by the total number employed in the same groups as shown on weekly reports. While this gives some rough indication of the general trend, the figures are affected by the number of persons working full and part time and by changes in the proportion of administrative, skilled and unskilled employees.

Average weekly earnings increased rapidly during the first weeks of the program while many new employees were being added. As the program expanded, the proportion of new employees working less than a full pay-roll week to total employees was steadily reduced with the result that the smaller amounts earned by these new employees had less effect upon the average weekly earnings of the entire group. This was true of administrative personnel as well as of persons employed on work projects.

The first projects to be undertaken under the program received a minimum of planning and supervision but as the program progressed, projects requiring more planning, and more skilled labor and technical supervision were developed. These factors contributed to the increase in average earnings and also explain in part the increasing number of administrative personnel shown in table 5.

Because of the interrelation of the administrative staffs of the Emergency Relief and Civil Works Administrations, it seems probable that during the first 3 months of the program administrative charges against CWA were somewhat understated. It seems equally probable that during April 1934 many administrative persons paid from CWA funds assisted in the establishment of the ERA work relief program. Employment data on administrative and nonadministrative projects presented in table 6 appears to support this assumption.

The order of January 18, 1934, curtailing employment to a maximum of 24 hours per week in cities of 2,500 population or over and to 15 hours per week in places of under that population and providing that no persons were to be added to the rolls except as actual replacements, was followed by a sharp decrease in both the total amount of earnings and average weekly earnings.

The reduction in the number employed, effective February 23 and each week thereafter in accordance with established quotas, resulted in a steady increase in average weekly earnings during March. This was due to the provision that reductions were to be made by laying off those least in need of work and in communities where opportunities for seasonal work were greatest. Employment was maintained longest in urban and industrial areas in which wage rates were generally higher and the hours of work longer than in rural areas. Moreover, as work projects were discontinued the earnings of administrative personnel accounted for an increasingly larger portion of total earnings. It should be noted that the employment and earnings figures for the weeks ending April 5, May 3, and July 14 are not comparable to other weekly figures. Discontinuation of portions of the program during these weeks resulted in large numbers of persons working only the first 2 or 3 days of the week. This is evidenced by the decrease in average weekly earnings for those periods as compared to averages both for preceding and for subsequent weeks.

Information concerning wage rates and weekly earnings was obtained from a study of sample pay-roll data for the weeks ending January 11, February 22, and March 15, 1934. Tables 7 and 8 show for these weeks the percentage distribution of skilled and unskilled labor on the Civil Works Program by hourly wage rates and weekly earnings. The data were based on sample pay rolls selected at random representing about 5 percent of the total number of persons working on projects employing principally skilled and unskilled labor. Largely as a result of the reduction in working hours, average earnings for the weeks studied in both February and March were considerably lower than for January 11. Evidence of this shift in the average earnings is found in the cumulative distribution. For the week ending January 11, a little more than half of the workers received \$14.25 or over, while during the week ending February 22 only 11 percent, and during the week of March 15 only 15.6 percent, received weekly earnings of \$15 or more.

A wider dispersion in hourly wage rates is indicated by the figures for the week ending March 15 than for earlier weeks of the program. While approximately 39 percent of all skilled and unskilled employees received from 50 to 54 cents an hour for the weeks covered in the January and February studies, only 33.5 percent were in this group during the week ending March 15. At the same time relatively more employees were paid at rates falling in both the high and low extremities of the distribution.

To facilitate the use of Civil Works Program earnings data, weekly figures have been converted into monthly series. Table 9 shows continental United States figures for earnings and total costs by months. Monthly earnings exclusive of earnings on administrative projects are distributed by States in table 10. These figures were arrived at by allocating amounts earned during a week including days in each of 2 months, on the assumption that pay rolls were staggered uniformly. The monthly distribution of total costs of the program, exclusive of central-office costs, have been estimated on the basis of monthly earnings. Although earnings and nonlabor costs probably did not follow the same trend, earnings represent such a large proportion of the total that the error is not great. Table 11 presents a distribution of total costs and Federal funds, by States, by calendar years.

#### **Types of Projects**

Because of statutory limitations on funds which were first made available for the program, CWA projects were originally limited to general construction purposes, including planning projects for subsequent construction work. Regulations required that all projects should be operated on public property, should be socially and economically desirable, and of such nature as to be undertaken quickly. All projects were operated by force account and could not be used to reduce the normal expenditures of State and local govern-

159973°—39—2

ments. The various State Civil Works Administrations, which gave final approval to each CWA State and local project before it was placed in operation, were responsible for the enforcement of the general limitations prescribed by the Federal Civil Works Administrator.

Because construction projects failed to provide employment for a large number of unemployed women and persons in professional and technical occupations, a Civil Works Service Program was soon set up under which projects primarily of a service or "white collar" nature were operated. These projects required the approval of the State Emergency Relief Administrator as well as the State Civil Works Administrator. The CWS program was very closely allied to the CWA program although differing in respect to sources of funds and certification of need. Both CWS and CWA projects were administered by the State Civil Works Administrations, although responsibility for supervising projects was often delegated to operating departments of other Statistics presented in this report cover both CWA and public agencies. On February 15, 1934, Congress appropriated for the CWS projects. Civil Works Program funds which were not restricted to construction purposes, and CWS projects then in operation became Civil Works projects, the transfers being completed by the end of March.

In addition to CWA projects initiated by State and local governments, certain Federal CWA projects were operated under the auspices of various Federal departments. They were, however, chiefly financed from CWA advances to the States in the same manner as other CWA projects and were subject to most of the same general rules and regulations. A part of the overhead expenses of the Federal departments supervising the projects was paid from CWA central office funds and these funds are included in central office rather than project statistics.

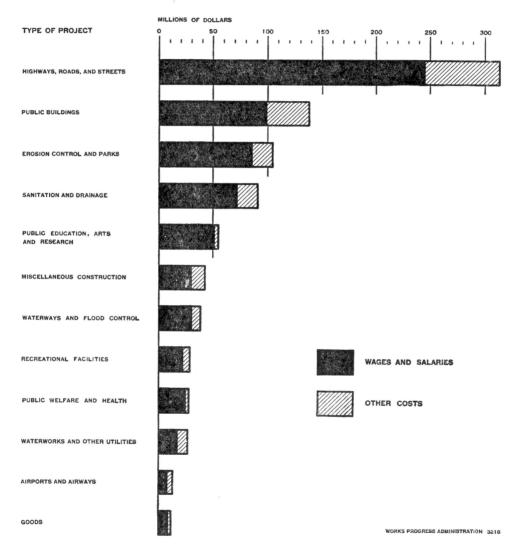

Estimates of total project costs by types of projects and items of cost for the continental United States and the United States and Territories are shown in tables 12 and 13. These are based on reports of completed, transferred, and discontinued Civil Works projects classified in the central office into 13 general From the percentage distribution given in table 14 and from chart 2 types. it is evident that by far the largest amount incurred for any one of these groups was for work on highways, roads, and streets, which represented almost 34 percent of the total. These projects, together with repair and construction on public buildings, accounted for very nearly half of all project costs. This is due in part to the fact that such projects could be initiated quickly, required a minimum of planning and preparation, and provided employment for a large number of unskilled or semiskilled persons. The work included varying degrees of improvement of the property, ranging from filling in holes and leveling road shoulders to the laying of new pavement. It is estimated that work was performed on 255,000 miles of highways, roads, and streets, of which over 160,000 were on the unpaved or farm-to-market type. Of the 60,500 buildings repaired or constructed under the program, over half were educational buildings.

Erosion control, irrigation, landscaping, and park projects were the third group in point of amount expended, representing over 11 percent of the total project costs. It is estimated that almost 5,000 parks were graded, planted, or otherwise improved.

#### CHART 2

# COST OF PROJECTS OPERATED UNDER THE CIVIL WORKS PROGRAM BY TYPE OF PROJECT AND OBJECT OF EXPENDITURE

CONTINENTAL UNITED STATES

Although white-collar and goods projects were not operated as extensively under the Civil Works Program as under the Emergency Work Relief Program (table 15), they represent a fairly substantial portion of total program costs.

By far the largest proportion of the costs incurred for the various projects was for wages and salaries, although the relative amounts differed somewhat according to types as indicated by the accompanying chart. Figures on wages and salaries shown in table 3 will not agree with total earnings shown in table 12 because, by instruction, wages and rent paid to operators of their own teams, trucks, and equipment were included in the weekly earnings reports, whereas they were reported in equipment costs on project reports from which table 12 was derived. Expenditures and contributions of materials, which amounted to approximately 13 percent of the total for all projects, represented over 20 percent of the costs for buildings and for waterworks and other utilities and less than 5 percent for public education, arts, and research projects.

Although the distribution of materials, supplies, and equipment costs by type of material shown in table 16 is not entirely complete, the percentages are fairly representative. Aggregate materials and stone, lumber, and iron and steel were the largest items and together represented almost half of the material, supplies, and equipment total.

#### Financing the Program

The program was first financed from a \$400,000,000 fund transferred from the Public Works Administration from amounts appropriated by the National Industrial Recovery Act. During January and February 1934, \$88,960,000 previously made available to the Federal Emergency Relief Administration from Reconstruction Finance Corporation funds by the Federal Emergency Relief Act of 1933 was transferred by the FERA to the Civil Works Administration. The Act of February 15, 1934, directly appropriated a total of \$950,000,000 for emergency relief and the Civil Works Program. Funds from this appropriation, amounting to \$337,000,000, were made available to the CWA by Executive order. In addition, States used portions of the grants which they received from the FERA for the Civil Works Service Program and for other aspects of the Civil Works Program. Sponsors' contributions of State and local agencies amounted to very nearly \$91,000,000. A considerable portion of these contributions was made in the form of materials and equipment.

Table 18 shows the distribution of total funds by sources, both for the continental United States and for the United States and Territories combined. A distribution of total Federal, State, and local funds by States and Territories is shown in table 17. Federal funds represented by far the greater part of the total, or 90.2 percent of all costs exclusive of central office, while State contributions amounted to 0.7 percent and local funds to 9.1 percent.

<sup>1</sup> The Emergency Work Relief Program was conducted by State and local emergency relief administrations. It was established in the spring of 1934 when
 C. W. A. projects were being discontinued and was gradually liquidated after Works Progress Administration projects began operation in the summer of 1935.
 <sup>2</sup> Includes wages paid to operators of their own teams, trucks, and equipment.
 <sup>3</sup> Does not include central office costs of the Civil Works Program. No administrative costs are shown for the Emergency Work Relief Program since it is impossible to separate the cost of administering this program from other Emergency Relief administrative costs.

#### Total Amount of Purchases and Contributions of Materials, Supplies, and Equipment for Civil Works Administration Projects <sup>1</sup> and Percentage Distribution by Specified Types, by States

<sup>1</sup> Includes CWA advances to States, FERA funds granted to States and used for CWA and CWS and State and local contributions.
 <sup>2</sup> Expenditures for States, other than direct settlements, amounting to \$1,626,018.67, arbitrarily assumed to be from funds appropriated by Act of Feb. 15,1934. Small amounts may actually have been paid from NIRA funds with compensating differences in "other central office" costs.
 <sup>3</sup> Includes Federal project costs of \$8,393,471.40.
