## THE EMPLOYMENT SITUATION：JANUARY 1966

In January，the job situation continued to reflect the stepped up pace of economic activity，the U。S。Department of Labor＇s Bureau of Labor Statistics eporter today．The post－Christmas decline in employment and rise in unemploy－ ment were less than usual．As a consequence，employment on a seasonally adjusted basis showed a further increase，while the unemployment rate，edged down to 4.0 percent－－the lowest point since early 1957 ．

## Total Employment and Labor Force

Total employment stood at 71.2 million in January，an increase of 2.2 million from a year earlier．Nonagricultural employment was up by nearly 2． 4 million workers over the year，while agricultural employment continued its long－ term decline，dropping by 150,000 。 Over－the－year increases in employment totaled 1.1 million for teenagers， 800,000 for adult women，and 300,000 for adult men．

Beginning with this release，data drawn from the household and the establishment surveys will be regularly reported together．The household survey provides the only comprehensive estimates on the size and characteristics of the labor force，the total employed，and the unemployed．The establish－ ment survey provides employment，hours，and earnings estimates by detailed industry．Employment data from the se two sources differ because of differences in definition and coverage，methods of collection，and sampling and estimating procedures． A major cause of differences is the inclusion in the household data of self－employed persons and persons employed in agriculture，private households，and as unpaid family workers．

Page 2
February 8， 1966

Among the 67． 7 million workers in nonagricultural industries，there were l． 8 million who worked part time as a result of slack work and other economic reasons．The number of these involuntary part－time workers was down by 300， 000 from a year ago and at its lowest January level since the se data were first collected in early 1955 。

Over the last 4 months，the total labor force has averaged 78.3 million， an increase of 1.7 million from the comparable period a year earlier and 400,000 larger than the long－run projected rise．Although the Armed Forces figure has been rising，the bulk of this increase（ 1.6 million）was in the civilian labor force．

## Industry Developments

Between December and January nonfarm payroll employment declined by 250， 000 less than seasonally．（These data exclude the self－employed，unpaid family workers，and private household workers，which are included in the total employment figures。）The reductions in trade，government，and manufacturing were all less than seasonally expected．Job reductions were close to seasonal expectations in contract construction，transportation and public utilities，fi－ nance industries，miscellaneous service industries，and mining．

After allowing for seasonal changes，manufacturing employment was up by 90,000 ．Job strength was particularly evident among the hard goods industries， especially in the five major metals and metal－using industries and stone，clay and glass．

Nonfarm payroll employment，at 61.0 million，was up by 2.8 million from a year ago，with gains in all industry groups except mining．Employment in manufacturing，at 18.3 million，was up by 875,000 from January 1965 ，the largest gain for a January－to－January period since 1955－56。 Over three－fourths of the gain occurred in the durable goods sector，with the major metal－working and metal－producing industries providing most of the impetus．Eighty percent of the gain from a year ago occurred among production workers．

Contract construction employment was up by 150,000 from a year ago and totaled nearly 3.0 million in January．The over－the－year employment increase in transportation and public utilities was about 80,000 after allowance for the dock strike in January of 1965.

Consistent with the long－run growth trend，the majority of the new jobs created in the nonfarm séctor over the year were in the service－producing industries，with trade，miscellaneous services，and State and local government providing the bulk of the increase．

The Employment Situation
Page 3
February 8, 1966

Factory Hours and Earnings
The factory workweek declined seasonally by 0.6 hour to 41.1 hours in January. The workweek included an average of 3.6 hours of overtime at premium pay, down 0.4 hour from December but the highest January level since this series originated in 1956. On a seasonally adjusted basis, the workweek was unchanged for the third consecutive month, still at its highest level since World War II. Hours continued to be relatively high in most industries, especially in fabricated metals, transportation equipment, and machinery.

Between December and January, average hourly earnings rose by l cent to $\$ 2.67$, an alltime high. However, weekly earnings edged down by $\$ 1.20$ to $\$ 109.74$ because of the reduction in average weekly hours.

## Unemployment

The number of unemployed workers rose less than seasonally in January to 3.3 million. Among the unemployed were $1-1 / 2$ million adult men, 1 million adult women, and 775, 000 teenagers. Almost all of the unemployed adult men, 80 percent of the adult women, and half of the teenagers were seeking full-time jobs. Nearly all of the net decline in unemployment since January 1965 occurred among adult workers--three-fourths men and one-fourth women。

Continued strength in labor demand was evident for most worker groups in January. The National unemployment rate inched downward to 4.0 percent, almost a percentage point below the January 1965 rate and at its lowest point since early 1957. Rates of unemployment for adult men and married men were virtually unchanged from December ( 2.6 and 1.9 percent, respectively) and were at their lowest points in more than a decade. The unemployment rate for blue-collar workers, most of whom are adult men, fell from 4.4 percent to 4. 2 over the month. The adult women rate, which had only developed a distinct downward trend within the last 2 years, continued to respond to the greater demand for workers, falling from 4.0 percent to 3.8 percent over the month. For all three groups of workers, rates were nearly a percentage point below January 1965 levels.

Jobless rates of teenagers have also shown significant declines. Over the month, their rate fell nearly one percentage point to 12.0 percent, as their employment declined less than seasonally. The teenage rate was still three times as high as the average。 Over the year, a record increase of 1.1 million in the civilian labor force for teenagers was matched by an equal employment increase. The number of unemployed teenagers was virtually unchanged from January 1965, at 800,000 , but their unemployment rate fell by 3 percentage points.

The Employment Situation
Page 4
February 8, 1966

January developments for men aged 20 to 24 reflected both the influence of increased military demands and sustained pressure for additional workers. Their unemployment rate dropped to 4.2 percent in January, nearly a full percentage point decline since December and 3 percentage points below the January 1965 rate. There has been a marked reduction in the number of men in the civilian labor force in this age group. A large portion of the decline reflects inductions into the Armed Forces and increased full-time school enrollments.

Unemployment among nonwhites numbered 675, 000 in January, one-fifth of the jobless total. Their unemployment rate at 7.0 percent, was down significantly from a year ago but remained twice the rate for whites.

Long-term unemployment of 15 weeks or longer ( 680,000 in January) was reduced by 170,000 over the year, and very long-term unemployment fell by 100,000 . Long-term unemployment was at its lowest January level in 8 years.

The number of persons receiving unemployment insurance benefits under State programs showed a slightly greater than seasonal rise from December to January, partly as a result of the New York City transit strike。 The rise of 500,000 to 1.7 million was widespread in nearly all States with New York, California, New Jersey, Pennsylvania and Wisconsin recording the largest upswings.

In accordance with regular practice at the beginning of each year, the seasonal adjustment of labor force components has been revised on the basis of more recent data. The revisions did not affect previously. published rates for total unemployment by more than 0.1 percentage point in any month. The updated seasonally adjusted data and seasonal adjustment factors will appear in the February issue of Employment and Earnings and Monthly Report on the Labor Force to be released on about February 16.
