THE EMPLOYMENT SITUATION: APRIL 1977

Employment in April continued its recent pattern of strong growth and unemployment declined, it was reported today by the Bureau of Labor Statistics of the U. S. Department of Labor. The overall unemployment rate fell from 7.3 percent in March to 7.0 percent, its lowest level in 29 months. The rate has decreased 1 full percentage point in the last 5 months and 2 percentage points from its May 1975 recession peak.

Total employment--as measured by the monthly survey of households--rose by more than half a million for the second month in a row, reaching a milestone of 90 million persons. Employment growth has been especially sharp since last October, totaling nearly 2.3 million, or an average of 380,000 a month.

Nonagricultural payroll employment--as measured by the monthly survey of establish-ments--also continued to exhibit marked growth with an increase of 270,000 in April to 81.6 million. Payroll jobs have expanded by almost 1.8 million since last October.

## Unemployment

The number of persons unemployed declined by 330,000 in April to 6.7 million, seasonally adjusted. This decrease took place primarily among persons who had lost their last job (including many who were recalled from layoff), and to a lesser extent among job leavers. (See tables A-1 and A-5.) Total unemployment has declined by more than 900,000 since its 1976 peak level reached last November, with nearly all of the improvement occurring among persons who had lost their last job.

The overall rate of unemployment declined from 7.3 to 7.0 percent over the month and was down a full percentage point from 1ast November. In 1976, the rate had moved up from a low of 7.3 percent in May to the year's high of 8.0 percent during the second half "pause" in the economic expansion.

Although nearly every worker group shared in the March-April downturn in unemployment, most of the reduction took place among adult men, whose jobless rate, at 5.0 percent, was also at its lowest point in 29 months. In addition, teenage unemployment showed its first sign of improvement in over a year, as the jobless rate moved down from 18.8 to 17.8 percent. The rate for adult women, on the other hand, was little changed over the month, at 7.0 percent. Among other worker categories, unemployment declined for male heads of households and white workers. The jobless rate for workers in the construction industry fell by more than 2 percentage points to 12.0 percent in April, its lowest level

Table A. Major indicators of labor market activity, seasonally adjusted

N.A. $=$ not available.
in $2 \frac{1}{2}$ years; the rate had been over 21 percent at the trough of the recent recession. Among the major occupational groups, the decline in unemployment was greatest for bluecollar workers. (See table A-2.)

The number of persons looking for work for 15 or more weeks--the long-term unemployed를 continued the decline that began in January, dropping by 100,000 to 1.8 million. However, because there was an even larger decrease (over 200,000) among those unemployed from 5 to 14 weeks, there was a slight increase in the average (mean) duration of joblessness over the month, from 14.0 to 14.3 weeks. (See table A-4.)

In addition to the drop in total unemployment, there was also a small reduction in the number of persons working part time for economic reasons. With the exception of the weather-energy related upturn in February, their number has also trended downard since reaching a November 1976 high of 3.5 million. (See table A-3.)

## Total Employment and Labor Force

Total employment rose for the sixth consecutive month, advancing by 550,000 in April to 90.0 million, seasonally adjusted. All three of the major age-sex categories shared in the expansion, with the largest gain taking place among adult women. (See table A-1.) Over the past year, employment has grown by 2.7 million, more than half of it in the last 3 months.

The employment-population ratio--the proportion of the total noninstitutional population that is employed-sustained its recent steady rise and in April stood at 57.0 percent. This was only 0.4 percentage point below the alltime high last reached in March 1974.

The civilian labor force increased by 220,000 in April. The labor force has risen by 2.4 million since last April with adult women accounting for 60 percent of this growth.

The civilian labor force participation rate--the proportion of the civilian noninstitutional population that is either working or looking for work--continued to rise. It was at an alltime high in Apri1--62.1 percent--well above the year-earlier level of 61.5 percent. (See table A-1.) The over-the-year increase has been dominated by the pronounced upsurge of adult women into the labor market. Adult men, on the other hand, have resumed their very gradual long-term downtrend in recent months, such that their
rate of participation in April was below that of a year ago.
Industry Payroll Employment
Total nonagricultural payroll employment also increased for the sixth consecutive month, advancing by 270,000 in April to 81.6 million, seasonally adjusted. Over-themonth gains occurred in 75 percent of the industries that comprise the BLS diffusion index of nonagricultural payroll employment. Since last April, payroll employment has grown by 2.3 million, with over three-quarters of the increase occurring in the past 6 months. (See tables B-1 and B-6.)

The largest over-the-month increases occurred in manufacturing $(80,000)$ and contract construction ( 75,000 ). Unlike recent months when there were strong gains in durable goods industries, most of the April advance in manufacturing took place in the nondurable goods sector, with the increases widespread throughout. Factory jobs have risen by 540,000 since last October. The increase in contract construction marked the third straight month of substantial growth, bringing employment in the industry to 3.8 million, 415,000 above its June 1975 recession low.

In the service-producing sector, employment in services rose by nearly 50,000 , while gains of about 20,000 each were posted in wholesale trade and finance, insurance, and real estate.

## Hours

The average workweek for production or nonsupervisory workers on private nonagricultural payrolls was 36.2 hours in April, seasonally adjusted, unchanged from the revised March level. The manufacturing workweek moved down 0.2 hour to 40.2 hours, while factory overtime edged up 0.1 hour to 3.4 hours. (See table B-2.)

Reflecting the increase in employment, the index of aggregate hours of private nonagricultural production or nonsupervisory workers rose to new high of 115.4 in April $(1967=100), 3.5$ percent above its year-earlier level. The factory index edged up to 97.3 in April and was up 4.6 percent from last April. (See table B-5.)

## Hourly and Weekly Earnings

Both average hourly and weekly earnings of private nonagricultural production or nonsupervisory workers increased 0.8 percent in April, seasonally adjusted. Since last

April, hourly and weekly earnings have risen 7.7 percent and 8.0 percent, respectively. Before adjustment for seasonality, average hourly earnings were $\$ 5.14$, up 3 cents from March. Hourly earnings were 36 cents above the April 1976 level. Average weekly earnings rose $\$ 1.08$ over the month to $\$ 184.53$ and have risen $\$ 13.41$ since April a year ago. (See table B-3.)

The Hourly Earnings Index
The Hourly Earnings Index--earnings adjusted for overtime in manufacturing, seasonality, and the effects of changes in the proportion of workers in high-wage and low-wage industries--was $195.2(1967=100)$ in April, 0.6 percent higher than in March. The index was 7.0 percent above April a year ago. During the 12 -month period ended in March, the Hourly Earnings Index in dollars of constant purchasing power rose 0.6 percent. (See table $B-4$. Several data series presented in the table have been revised slightly as a result of corrections in the computerized data file and the introduction of more precision in the processing system.)

## Explanatory Note

This release presents and analyzes statistics from two major surveys. Data on labor force, total employment, and unemployment (A tables) are derived from the Current Population Survey, a sample survey of households conducted by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 47,000 households selected to represent the U.S. civilian noninstitutional population 16 years of age and over.

Statistics on nonagricultural payroll employment, hours, and earnings ( $B$ tables) are collected by the Bureau of Labor Statistics, in cooperation with State agencies, from payroll records of a sample of approximately 165,000 establishments. Unless otherwise indicated, data for both series relate to the week containing the 12th day of the specified month.

## Comparability of household and payroll employment statistics

Employment data from the household and payroll surveys differ in several basic respects. The household survey provides information on the labor force activity of the entire population 16 years of age and over, without duplication, since each person is classified as employed, unemployed, or not in the labor force.

The payroll survey relates only to paid wage and salary employees (regardless of age) on the payrolls of nonagricultural establishments. The household survey counts em: ployed persons in both agriculture and in nonagricultural industries and, in addition to wage and salary workers (including private household workers), includes the selfemployed, unpaid family workers, and persons "with a job but not at work" and not paid for the period absent. Persons who worked at more than one job during the survey week or otherwise appear on more than one payroll are counted more than once in the establishment survey. Such persons are counted only once in the household survey and are classified in the job at which they worked the greatest number of hours.

## Unemployment

To be classified in the household survey as unemployed an individual must: (1) have been without a job during the survey week, (2) have made specific efforts to find employment sometime during the prior 4 weeks, and (3) be presently available for work. In addition, persons on layoff and those waiting to begin a new job (within 30 days) are also classified as unemployed. The unemployed total
includes all persons who satisfactorily meet the above criteria, regardless of their eligibility for unemployment insurance benefits or any kind of public assistance. The unemployment rate represents the unemployed as a proportion of the civilian labor force (the employed and unemployed combined).

To meet the extensive needs of data users, the Bureau regularly publishes data on a wide variety of labor market indicators-see, for example, the demographic, occupational, and industry detail in tables A-2 and A-3. A special grouping of seven unemployment measures is set forth in table A-7. Identified by the symbols U-1 through U.7, these measures represent a range of possible definitions of unemployment and of the labor force, extending from the most restrictive (U-1) to the most comprehensive (U-7). The official rate of unemployment appears as U-5.

## Seasonal adjustment

Nearly all economic phenomena are affected to some degree by seasonal variations. These are recurring, predictable events which are repeated more or less regularly each year-changes in weather, school vacations, major holidays, industry production schedules, etc. The cumulative effects of these events are often large. For example, on average over the year, they explain about 90 percent of the month-to-month variance in the unemployment 'figures. Since seasonal variations tend to be large relative to the underlying cyclical trends, it is necessary to use seasonallyadjusted data to interpret short-term economic developments. At the beginning of each year, current seasonal adjustment factors for unemployment and other labor force series are calculated taking into account the prior year's experience, and revised data are introduced in the release containing January data.

All seasonally-adjusted civilian labor force and unemployment rate statistics, as well as the major employment and unemployment estimates, are computed by aggregating independently adjusted series. The official unemployment rate for all civilian workers is derived by dividing the estimate for total unemployment (the sum of four seasonallyadjusted age-sex components) by the civilian labor force (the sum of 12 seasonally-adjusted age-sex components). Several alternative methods for seasonally adjusting the overall unemployment rate are also used on a regular basis in order to illustrate the degree of uncertainty that arises because of the seasonal adjustment procedure. Among these alternative methods are five different age-sex adjustments,
including a concurrent adjustment and one based on stable factors and four based on other unemployment aggregations. Alternative rates for 1976 are shown in the table at the end of this note. (Current alternative rates and an explanation of the methods may be obtained from BLS upon request.)

For establishment data, the seasonally-adjusted series for all employees, production workers, average weekly hours, and average hourly earnings are adjusted by aggregating the seasonally-adjusted data from the respective component series. These data are revised annually, usually in conjunction with the annual benchmark adjustments (comprehensive counts of employment).

## Sampling variability

Both the household and establishment survey statistics are subject to sampling error, which should be taken into account in evaluating the levels of a series as well as changes over time. Because the household survey is based upon a probability sample, the results may differ from the figures that would be obtained if it were possible to take a complete census using the same questionnaire and procedures. The standard error is the measure of sampling variability, that is, the variations that might occur by chance because only a
sample of the population is surveyed. Tables A-E in the "Explanatory Notes" of Employment and Earnings provide standard errors for unemployment and other labor force categories.

Although the relatively large size of the monthly establishment survey assures a high degree of accuracy, the estimates derived from it also may differ from the figures obtained if a complete census using the same schedules and procedures were possible. Moreover, since the estimating procedures employ the previous month's level as the base in computing the current month's level of employment (link-relative technique), sampling and response errors may accumulate over several months. To r. . ve this accumulated error, the employment estimates are adjusted to new benchmarks, usually annually. In addition to taking account of sampling and response errors, the benchmark revision adjusts the estimates for changes in the industrial classification of individual establishments. Employment estimates are currently projected from March 1974 benchmark levels. Measures of reliability for employment estimates are provided in the "Explanatory Notes" of Employment and Earnings, as are the actual amounts of revisions due to benchmark adjustments (tables G-L).

1 Data relate to production workers in mining and manufacturing: to construction workers in contract construction: and to nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fifths of the total employment on private nonagricultural payrolls. $\mathrm{p}=$ preliminary.

2 Percent change was 0.6 from March 1976 to March 1977, the latest month available.
3 Percent change was -0.2 from February 1977 to March 1977, the latest month available.
N.A. $=$ not availatle.
p=prefiminary
NOTE: All series are in current dollars except where indicated. The index excludes effects of two types of changes that are unrelated to underlying wage-rate developments: Fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes in the proportion of workers in high-wage and low-wage industries

Table B-5. Indexes of aggregate weekly hours of production or nonsupervisory workers ${ }^{1}$ on private nonagricultural payrolls, by industry, seasonally adjusted
