USDL 78-16
TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL 9:00 A. M. (EST), WEDNESDAY, JANUARY 11, 1978

THE EMPLOYMENT SITUATION: DECEMBER 1977

Employment rose and unemployment dropped sharply in December, it was reported today by the Bureau of Labor Statistics of the U. S. Department of Labor. The December unemployment rate was 6.4 percent, down considerably from November and 1.4 points below December 1976.

Total employment-as measured by the monthly survey of households--continued to expand with a substantial increase for the second straight month. The proportion of the population with jobs rearined a record 58.0 percent, up from 56.3 in December a year ago. The number of employed persons increased by 4.1 million over this period to 92.6 million.

Nonfarm payroll employment--as measured by the monthly survey of establishments-rose by 215,000 over the month to 83.4 million. This employment count excludes striking workers, whose ranks increased by 110,000 in December as a result of the mine workers' strike. (The household survey, on the other hand, classifies striking workers as employed.) Over the past year, payroll jobs have risen by 3.1 million.

## Unemployment

The level of unemployment fell by 480,000 to 6.3 million, seasonally adjusted, in December. Most of the improvement took place among persons who had lost their last jobs. The unemployment rate also declined sharply in December, to 6.4 percent. Over the year, the number of unemployed dropped by more than 1.1 million and the rate registered a decline of 1.4 percentage points. (See table A-1.) Both the number and the rate were the lowest since late 1974. (See addendum on seasonal adjustment on page 6 of this release.)

The November-December unemployment declines affected nearly all major demographic, occupational, and industry groups. Substantial declines among adult men, women, and
teenagers brought their rates to 4.7 percent, 6.7 percent, and 15.4 percent, respectively. Black unemployment showed a substantial reduction, as the rate fell from 13.8 to 12.5 percent. The rate for whites also declined, from 6.0 to 5.6 percent. Over the year, jobless rates dropped markedly for white men, women, and teenagers and black adult men, while no downtrend was evident among black women and teenagers. (See table A-2.)

Although the unemployment rate for blue-collar workers continued to exceed that for white-collar workers, the difference narrowed in 1977. A strong November-December improvement brought the blue-collar rate to 7.3 percent, down from 9.6 percent a year earlier. The white-collar rate of 3.9 percent showed a drop of six-tenths of a point

| Manufacturing overtime . . . . | 3.1 | 3.3 | 3.4 | 3.3 | 3.5 p | 3.5 | 3.5p | 3.4 p |

over the year. The rate for service workers fell a full percentage point in that time frame to 8.0 percent, and the farm workers rate was down two points to 4.1 percent. Among the major industries, there was a particularly strong decline for factory workers in December, and their rate was nearly two and a half points lower than its year-ago level.

The average (mean) duration of unemployment was little changed in December, at 14.1 weeks, but was down $1 \frac{1}{2}$ weeks over the past year. (See table A-4.)

## Total Employment and the Labor Force

An increase in employment almost matched the decline in unemployment, as the size of the labor force was little changed over the month. Total employment rose 410,000 in December to 92.6 million, with adult men the major job gainers. (See table A-1.) The November-December growth in employment was concentrated among full-time workers.

Over the year, employment grew by 4.1 million, or 4.7 percent, marking the largest 12-month gain ever recorded in the post-World War II period. The number of employed adult men was up 1.8 million, adult women advanced by 1.7 million, and teenagers increased their employment by close to 650,000 . Employment in blue-collar and service work grew relatively more than other occupations. (See tables A-1 and A-3.)

The civilian labor force remained at 98.9 million in December, after an unusually large increase of 900,000 in the prior month. The 12 -month rise was nearly 3 million. The labor force participation rate--the proportion of the civilian noninstitutional population either working or seeking work-- edged back to 62.8 percent, just below the alltime high of 62.9 percent recorded in November.

## Discouraged Workers

Discouraged workers are persons who report that they want work but are not looking for jobs because they believe they cannot find any. Because they do not meet the labor market test-that is, they are not engaged in active job search-they are classified as not in the labor force rather than as unemployed. These data are published on a quarterly basis.

Consistent with the decline in unemployment during the fourth quarter, the number of discouraged workers also fell. The fourth quarter average was about 970,000, down from 1.1 million in the second and third quarters and slightly below its year-ago level. About 70 percent of the discouraged total cite job-market factors as their reason for not seeking work. (See table A-8.)

## Industry Payroll Employment

Nonfarm payroll employment increased by 215,000 in December to 83.4 million, seasonally adjusted. All but one of the major industry groups posted employment gains, as 78 percent of the 172 industries that comprise the BLS diffusion index of private nonagricultural payroll employment showed increases in December. Although the over-themonth increase in payroll employment was substantial, it would have been greater save for the effect of a net increase of 110,000 workers on strike. Nonfarm payroll jobs have expanded by 3.1 million over the past year. (See tables B-1 and B-6.)

The largest over-the-month employment gain took place in manufacturing--160,000. Most of this increase occurred in the durable goods industries, where gains were pervasive. However, the 40,000 increase in the transportation equipment industry resulted mainly from a return of striking aircraft workers to their jobs.

Employment in contract construction continued to improve. An over-the-month increase of nearly 20,000 brought the level of employment 355,000 above its level in December 1976. Employment increases also occurred in the services industry, State and local government, transportation and public utilities, and trade.

Employees on mining payrolls declined by 150,000 over the month, due entirely to the effects of a major strike by the United Mine Workers.

## Hours

The average workweek for production or nonsupervisory workers on private nonagricultural payrolls edged down by a tenth of an hour in December to 36.0 hours, seasonally adjusted. The December workweek stood 0.2 hour below its year-ago level. In manufacturing, the workweek dropped 0.2 hour in December, but, at 40.3 hours, was still 0.3 hour above its year-ago level. Manufacturing overtime, at 3.4 hours, declined 0.1 hour from November but was still above the year-ago point. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonagricultural payrolls edged down to $117.0(1967=100)$ in December, 0.1 percent below the November level. However, the overall index has increased by 3.3 percent since December 1976. (See table B-5.)

## Hourly. and Weekly Earnings

Average hourly earnings of production or nonsupervisory workers on private nonfarm payrolls increased by 0.4 percent, seasonally adjusted, in December. Average weekly earnings advanced by only 0.1 percent, however, due to the slight decline in the average workweek. Compared with their year-ago levels, average hourly and weekly earnings were up 7.8 and 7.2 percent, respectively.

Before adjustment for seasonality, average hourly earnings were unchanged from November's $\$ 5.41$ but were 39 cents above December 1976. Average weekly earnings increased by $\$ 1.08$ over the month, reaching $\$ 195.84$ in December. Over the year, average weekly earnings grew by \$13.11. (See table B-3.)

The Hourly Earnings Index
The Hourly Earnings Index--earnings adjusted for overtime in manufacturing, seasonality, and the effects of changes in the proportion of workers in high-wage and low-wage industries--was $204.8(1967=100)$ in December, 0.4 percent higher than in November. The index was 7.4 percent above December a year ago. During the 12 -month period ended in November, the Hourly Earnings Index in dollars of constant purchasing power rose 0.7 percent. (See table B-4. Data in table B-4 reflect revised seasonal adjustment factors.)

At the beginning of each calendar year, the Bureau of Labor Statistics routinely revises the seasonally-adjusted labor force series derived from the Current Population Survey to take into account data from the previous year. These revisions are published in the February release of January data and are used through the end of the year. Because of the particular timing of this release and a speed-up in seasonal-adjustment processing, it is possible this year to release at this time the revisions in the overall unemployment rate that result from the use of new seasonal-adjustment factors for 1978.

The table below contains the overall monthly seasonally-adjusted unemployment rates for the past 13 months as originally published and as they are to be revised. It is to be noted that the seasonally-adjusted rate for December is the same using the old and the new factors. However, the pattern for the year is somewhat different using the revised factors, in that there is a more steady decline in the unemployment rate during the year rather than a sharp drop in December. The revisions, of course, have no effect on the 1977 annual average rate, which was 7.0 percent.

As soon as they can be prepared for publication, revised 1977 data for many series presented in this release will be issued in a special press release, probably on or about January 23. As usual, the release of January 1978 seasonally-adjusted data on February 3 will be based on the revised seasonal factors. Historical data will be available after January 23 upon request and will also be published in the February 1978 issue of Employment and Earnings.

Table B. Seasonally adjusted unemployment rates for the past 13 months

| Month |  | As currently published |  | As revised |

|  | November. |  | 6.9 | 6.7 |
|  | December. |  | 6.4 | 6.4 |

## Explanatory Note

This release presents and analyzes statistics from two major surveys. Data on labor force, total employment, and unemployment (A tables) are derived from the Current Population Survey, a sample survey of households conducted by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 47,000 households selected to represent the U.S. civilian noninstitutional population 16 years of age and over.

Statistics on nonagricultural payroll employment, hours, and earnings ( $B$ tables) are collected by the Bureau of Labor Statistics, in cooperation with State agencies, from payroll records of a sample of approximately 165,000 establishments. Unless otherwise indicated, data for both series relate to the week containing the 12th day of the specified month.

## Comparability of household and payroll employment statistics

Employment data from the household and payroll surveys differ in several basic respects. The household survey provides information on the labor force activity of the entire population 16 years of age and over, without duplication, since each person is classified as employed, unemployed, or not in the labor force.

The payroll survey relates only to paid wage and salary employees (regardless of age) on the payrolls of nonagricultural establishments. The househoid survey counts employed persons in both agriculture and in nonagricultural industries and, in addition to wage and salary workers (including private household workers), includes the selfemployed, unnaid family workers, and persons "with a job but not at work" and not paid for the period absent. Persons who worked at more than one job during the survey week or otherwise appear on more than one payroll are counted more than once in the establishment survey. Such persons are counted only once in the household survey and are classified in the job at which they worked the greatest number of hours.

## Unemployment

To be classified in the household survey as unemployed an individual must: (1) have been without a job during the survey week, (2) have made specific efforts to find employment sometime during the prior 4 weeks, and (3) be presently available for work. In addition, persons on layoff and those waiting to begin a new job (within 30 days) are also classified as unemployed. The unemployed total
includes all persons who satisfactorily meet the above criteria, regardless of their eligibility for unemployment insurance benefits or any kind of public assistance. The unemployment rate represents the unemployed as a proportion of the civilian labor force (the employed and unemployed combined).

To meet the extensive needs of data users, the Bureau regularly publishes data on a wide variety of labor market indicators-see, for example, the demographic, occupational, and industry detail in tables A-2 and A-3. A special grouping of seven unemployment measures is set forth in table A-7. Identified by the symbols U-1 through U-7, these measures represent a range of possible definitions of unemployment and of the labor force, extending from the most restrictive ( $\mathrm{U}-1$ ) to the most comprehensive (U-7). The official rate of unemployment appears as U-5.

## Seasonal adjustment

Nearly all economic phenomena are affected to some degree by seasonal variations. These are recurring, predictable events which are repeated more or less regularly each year-changes in weather, school vacations, major holidays, industry production schedules, etc. The cumulative effects of these events are often large. For example, on average over the year, they explain about 90 percent of the month-to-month variance in the unemployment figures. Since seasonal variations tend to be large relative to the underlying cyclical trends, it is necessary to use seasonallyadjusted data to interpret short-term economic developments. At the beginning of each year, current seasonal adjustment factors for unemployment and other labor force series are calculated taking into account the prior year's experience, and revised data are introduced in the release containing January data.

All seasonally-adjusted civilian labor force and unemployment rate statistics, as well as the major employment and unemployment estimates, are computed by aggregating independently adjusted series. The official unemployment rate for all civilian workers is derived by dividing the estimate for total unemployment (the sum of four seasonallyadjusted age-sex components) by the civilian labor force (the sum of 12 seasonally-adjusted age-sex components). Several alternative methods for seasonally adjusting the overall unemployment rate are also used on a regular basis in order to illustrate the degree of uncertainty that arises because of the seasonal adjustment procedure. Among these alternative methods are five different age-sex adjustments,
including a concurrent adjustment and one based on stable factors and four based on other unemployment aggregations. Alternative rates for 1976 are shown in the table at the end of this note. (Current alternative rates and an explanation of the methods may be obtained from BLS upon request.)

For establishment data, the seasonally-adjusted series for all employees, production workers, average weekly hours, and average hourly earnings are adjusted by aggregating the seasonally-adjusted data from the respective component series. These data are revised annually, usually in conjunction with the annual benchmark adjustments (comprehensive counts of employment).

## Sampling variability

Both the household and establishment survey statistics are subject to sampling error, which should be taken into account in evaluating the levels of a series as well as changes over time. Because the household survey is based upon a probability sample, the results may differ from the figures that would be obtained if it were possible to take a complete census using the same questionnaire and procedures. The standard error is the measure of sampling variability, that is, the variations that might occur by chance because only a
sample of the population is surveyed. Tables A-E in the "Explanatory Notes" of Employment and Earnings provide standard errors for unemployment and other labor force categories.

Although the relatively large size of the monthly establishment survey assures a high degree of accuracy, the estimates derived from it also may differ from the figures obtained if a complete census using the same schedules and procedures were possible. Moreover, since the estimating procedures employ the previous month's level as the base in computing the current month's level of employment (link-relative technique), sampling and response errors may accumulate over several months. To remove this accumulated error, the employment estimates are adjusted to new benchmarks, usually annually. In addition to taking account of sampling and response errors, the benchmark revision adjusts the estimates for changes in the industrial classification of individual establishments. Employment estimates are currently projected from March 1974 benchmark levels. Measures of reliability for employment estimates are provided in the "Explanatory Notes" of Employment and Earnings, as are the actual amounts of revisions due to benchmark adjustments (tables G-L).
