the employment situation: february 1979

Employment rose in February and unemployment was unchanged, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The level of unemployment remained at 5.9 million and the overall rate of joblessness ( 5.7 percent) continued to hover just below the 6 percent mark.

Total employment-as measured by the monthly survey of households--grew by 345,000 in February to 96.6 million. Over the past year, the number of employed persons has increased by 3.6 million.

Nonfarm payroll employment--as measured by the monthly survey of establishments--rose by 300,000 over the month to 87.8 million. Since February 1978, nonagricultural payroll jobs have advanced by 3.5 million.

Unemployment
The unemployment picture continued unchanged in February. The number of persons unemployed remained at January's level of 5.9 million , while the unemployment rate, 5.7 percent, was not very different from those of the prior 6 months. Similarly, the rates for adult men ( 4.0 percent), adult women ( $5 . \dot{7}$ percent), and teenagers ( 16.1 percent) showed no significant movements from January to February, nor have these rates shown any substantive changes since August 1978.

Since February a year ago, the o erall jobless rate has declined by four-tenths of a percentage point, and the number of unemployed has fallen by a quarter of a million. Virtually all of the decline in unemployment took place among adult men, whose rate was down by half a point. The unemployment rate for whites also has droppad by half a point, principally reflecting developments among white adult men, while the rate for blacks has shown no improvement. Hispanic workers experienced an over-the-year reduction in joblessness. (See tables A-1, A-2, and A-8.)

## Total Employment and the Labor Force

Total employment expanded by about 345,000 in February, a larger-than-average monthly rise, and the employment-to-population ratio reached a record 59.4 percent. All of the increase occurred among adults, with both men and women contributing. White-collar workers--particularly professional and clerical workers-were the major gainers. Over the year, employment has fincreased by 3.6 million, and white-collar jobholders have accounted for almost 70 percent of the growth. (See tables A-1 and A-3.)

The cifilian labor force also grew by about 345,000 over the month to 102.5 million. The labor force was 3.3 million, or 3.4 percent, larger than a year earlier. At 63.9 percent, the civilian labor force participation rate reached a new high and was more than a point above the Pebruary 1978-level.

## Industry Payroll Employment

Nonfarm payroll employment increased by 300,000 to 87.8 million in February, as employment grew in two-thirds of the 172 industries that comprise the BLS diffusion index of private nonagricultural employment. The number of nonfarm jobs was 3.5 million higher than a year earlifer (See tables $\mathrm{B}-1$ and $\mathrm{B}-6$. )

For the second consecutive month, job gains were strongest in retail trade $(115,000)$. The 2 -month expansion of 200,000 contributed heavily to an over-the-year employment growth of 640,000 in this industry.

Sizeable over-the-month growth also occurred in durable goods manufacturing ( 80,000 )--led by transportation equipment, machinery, and electrical equipment-and services ( 65,000 ). Smaller over-the-month gains took place in transportation and public utilities $(35,000)$ and finance, insurance, and real estate ( 15,000 )

Construction employment was down by 30,000 in February, following a somewhat smaller decife in January; however, employment in this cyclically sensitive industry was atill 400,000 above the year-earlier level. Employment in mining continued the steady upward movement that has been evident since the 1973 energy crisis.

## Hours

The average workweek of production or nonsupervisory workers on private nonagricultural payrolls was 35.7 hours in February, unchanged from the January level. The manufacturing workweek, at 40.6 hours, edged down 0.1 hour over the month. Factory overtime, at 3.8 hours, was unchanged from January's level. (See table b-2.)

Reflecting the February employment increase, the index of aggregate weekly hours of production or nonsupervisory workers on private nonagricultural payrolls rose 0.5 percent to 123.0 ( $1967=100$ ). The index was 5.0 percent above its year-ago level. (See table B-5.)

## Hourly and Weekly Earnings

Average hourly and weekly earnings of production or nonsupervisory workers on private nonagricultural payrolls both rose 0.5 percent from January and were 8.7 percent higher than February 1978 (seasonally adjusted). Before adjustment for seasonality, average hourly earnings rose 2 cents to $\$ 5.97,48$ cents above February 1978. Average weekly earnings were $\$ 211.34, \$ 1.90$ above January and $\$ 17.54$ above a year earlier. (See table B-3.)

## The Hourly Earnings Index

The Hourly Earnings Index--earnings adjusted for overtime in manufacturing, seasonality, and the effects of changes in the proportion of workers in high-wage and low-wage industries-was 223.1 ( $1967=100$ ) in February, 0.4 percent higher than in January. The index was 8.0 percent above February a year ago. During the 12 -month period ended in January, the Hourly Earnings Index in dollars of constant purchasing power declined 1.3 percent. (See table B-4. Constant dollar data reflect revisions in the seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers--CPI-W.)

## Explanatory Note

This release presents and analyzes statistics from two major surveys. Data on labor force, total employment, and unemployment (A tables) are derived from the Current Population Survey-a sample survey of Census for the Bureau of Labor Statisties. Beginning in September 1975, the sample was enlarged by 9,000 households in order to provide greater reliability for smaller States and thus permit the publication of annual statisties for all 50 States and the District of Columbia. These supplementary households were added to the 47,000 national household sample in January 1978; thus selected to represent the U.S civilian noninstitutions population 16 years and over.

Statistics on nonagricultural payroll employment, hours, and earnings ( B tables) are collected by the Bureau of Labor Statistics, in cooperation with State agencies, from payrohl records of a sample of approximately 165,000 establishments. Unless otherwise indicated, data for both statistical series relate to the week
containing the 12 th day of the specified month.

## hold and payrol

employment statistics
Employment data from the household and payroll surveys differ in several basic respects. The household survey provides information on the labor force activity years of age and over, without duplication. Each person is classified as either employed, unemployed, or not in the labor force. The household survey counts employed persons in both agriculture and nonagricultural industries and, in addition to wage and salary workers (including private household workers), counts the selfemployed, unpaid family workers, and persons "with a The payroll survey relates only to paid wage and
ary employecs (regardless of age) on the payrolls of nonagricultural establishments. Persons who worked at more than one job during the survey week or otherwise appear on more than one payroll are counted more than once in the establishment survey. Such persons are counted only once in the household survey and are classified of here job at which they worked greates

## Unemployment

To be classified in the household survey as unemployed an individual must: (1) Have been without a
job during the survey week; (2) have made specific efforts ta find employment sometime during the prior 4 weeks; and (3) be presently available for work. In addition, persons on layoff and those waiting to begin a
new job (within 30 days), neither of whom must meet the jobseeking requirements, are also classified as unemployed. The unemployed total includes all persons who satisfactorily meet the above criteria, regardless of their eligibility for unemployment insurance benefits or any kind of public assistance. The unemployment rate represents the unemployed as a proportion of the civilian labor force (the employed and unemployed combined).

The Bureau regularly publishes a wide variety of labor market measures. See, for example, the demographic, occupational, and industry detail in tables A-2 data package in Employment and Earnings each month. A special grouping of seven unemployment measures is set forth in table A-7. Identified by the symbols U-1 through U-7, these measures represent a range of force-from the most restrictive ( $\mathrm{U}-1$ ) to the most comprehensive ( $\mathrm{U}-7$ ). The official rate of unemployment appears as U-5.

## Seasonal adjustmen

Nearly all economic phenomena are affected to some degree by seasonal variations. These are recurring, predictable events which are repeated more or less regularly each year-changes in weather, opening and closing of schools, major holidays, industry producevents are often large. For example, on average over the year, they explain about 95 percent of the month-to-month variance in the unemployment figures. Since seasenal variations tend to be large relative to the
underlying cyclical trends, it is necessary to use underlying cyclical trends, it is necessary to $^{\circ}$ use economic developments. At the beginning of each year, seasonal adjustment factors for unemployment and other labor force series are calculated for use during the entire year, taking into account the prior year's experience

All sexsonally-adjusted civilian'labor force and unemplo, nent rate statistics, as well as the major employment and unemployment estimates, are computed by aggregating independently adjusted series. is derived by dividing the estimate for total unem-
ployment (the sum of four seasonally-adjusted age-sex components) by the civilian labor force (the sum of 12 seasonally-adjusted age-sex components).

For establishment data, the seasonally-adjusted series for all employees, production workers, average weekly hours, and average hourlv carnings are adjusted by aggregating the seasonally-adjusted data from the
respective component serics. These data are also respective component serics. These data are also
revised annually, often in conjunction with benchmark revised annually, often in conjunction with benchmark The most recent revision of seasonally-adjusted data was based on data through May 1978.)

## Sampling variability

Both the household and establishment survey slatistics are subject to sampling error, which should be taken into account in evaluating the levels of a series as well as changes over time. Because the household survey is based upon a probability sample, the results were possible to take a complete census using the same questionnaires and procedures. The standard error is the measure of sampling variability, that is, of the variation that occurs by chance because a sample rather than the entire population is surveyed. Te chances are about 68 out of 100 that an estimate from the survey differs from a figure that would be obtained through a A through H in the "Explanatory Notes" of Employment and Earnings provide approximations of the standard errors for unemployment and other labor force categories. To obtain a 90 -percent level of confidence, the conifence interval generally used by BLS, the errors should be multiplied by 1.6. The following examples provide an indication of the magnitude of
sampling error: For a monthly change in total em-
ployment the standard error is on the order of plus or minus 182,000 . Similarly, the standard error on a change tandard error on a change in the national unemployment rate is 0.12 percentage point.
Although the relatively large size of the monthly establishment survey assures a high degree of accuracy, the estimates derived from it also may differ from the figures obtained if a complete census using the same schedules and procedures were possible. However, since level as the base in computing the current month's level of employment (link-relative technique), sampling and response errors may accumulate over several months. To remove this accumulated error, the employment
estimates are adjusted to new benchinarks (comprehensive counts of employnment), usunlly on an annual basis. In addition to taking account of sumpling estimates for changes in the industrial classification of individual establishments. Employment estimates are currently projected from March 1977 levels.

One measure of the reliability of the employment estimates for individual industries is the root-meansquare error (RMSE). The RMSE is the standard deviation adjusted for the bias in estimates. If the bias is small, the chances are about 68 out of 100 that an
estimate from the sample would differ from its benchmark by less than the RMSE. For total nonagricultural employment, the RMSE is on the order of plus or minus 81,000. Measures of reliability (approximations of the RMSE for establishment-survey data and actua amounts of revision due to benchmark adjustments are provided in tables J through O in the "Explanatory Notes" of Employment and Earnings.

Data relate to production workers in mining and manufacturing: to construction workers in construction; and to nonsupervisory workers in transportation and public utilities; wholesale and retall trade; finance, insurance, and real estate; and services. These groups account for approximately four-fifths of the total employment on private nonagricultural payrolls.
$\rho=$ preliminary

S See foomote 1 , table $\mathrm{B}-2$.
2 PERCENT CHANGE WAS - 1.3 from January 1978 to January 1979, fhe latest month available.
3 PERCENT CHANGE WAS -. 2 from december 1978 to January igto. the latest month available.
N.A. = not available.
p=preliminary.
NOTE: All series are in current dollars except where indicated. The index excludes effects of two types of changes that are unrelated to underlying wage-rate developments: Fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes in the proportion of workers in high wage and low-wage industries.

Table B-5. Indexes of aggregate weekly hours of production or nonsupervisory workers, on private nonagricultural payrolls by industry, seasonally adjusted

Table B-6. Indexes of diffusion: Percent of industries in which employment ${ }^{1}$ increased

1 Number of employees, seasonally adjusted, on payrolls of 172 private nonagricultural industries. $p=$ preliminary .
U.S. DEPARTMENT OF LABOR BUREAU OF LABOR STATISTICS WASHINGTON, D.C. 20210

OFPICIAL BUSHMEST
OENALTY FOR DAVATE MOE, teve

[^0]:    2 Data on persons of Hispanic origin are tabulated separately，without regard to race，which means that they are also included in the data for white and black workers．At the time of the 1970 Census， approximately 96 percent of their population was white．

[^1]:    1. Vietnamera veterans are those who served between August 5, 1964 and May 7, 1975.
    ${ }^{2}$ Nonveterans are males who have never served in the Armed Forces. Published data are limited. to those $25-39$ years of age, the group that most closely corresponds to the bulk of the Vietnamera veteran population.
